Sold in Straw.—In the case in which he may elect to dispose of his *Flax in the straw*, the farmer would derive the full value of his crop of seed, and the straw would be worth to him 4*l.* per ton, the produce being about 2 tons per acre. He will not be required, as is the case at present, to pull his Flax before it is perfectly ripe, or before the seed has been fully and completely formed. Indeed the *coarser and more developed* is the stem of the plant, the more valuable will it be for the purpose of adaptation to the woollen and cotton machinery, and the fine gossamer threads can be produced from it with greater certainty and precision than when pulled in an earlier stage of its growth. The grower, therefore, need be under no fear as to the fineness of his crop, and he may obtain from it as large an amount of seed as his land will produce.

Partial Cleaning.—If the difficulty of transporting the flax in the straw to any great distance should render it necessary for the grower to reduce its bulk, by the removal of some of the woody part of the plant, he will obtain by so doing, in addition to the seed, a valuable article of food for his cattle, and the enhanced value of the fibre will more than repay the amount of labour bestowed upon it.

Complete Preparation.—If disposed to carry the preparation of the flax to its final stage of adaptation to the spindles of the manufacturer, whether cotton, linen, wool, or silk, he will derive a profit larger and more certain than any which he can obtain under the present process; while, from the refuse straw impregnated with the salts used in its preparation, he will obtain a manure of the richest and most fertilising character.

Social Advantages.—One word upon the social advantages which must result from an extended cultivation of Flax, and my remarks (already, I fear, too protracted) will have been brought to a close. Upon this point, I cannot do better than quote a few words from the report

of one of the special correspondents of the *Morning Chronicle* who visited the small village of Trimingham, where Mr. Warnes has for several years most sedulously and successfully devoted himself to the cultivation and preparation of the plant.

"The condition of the inhabitants of the village," he says, "was a few years since most deplorable, and the amount of pauperism exceeded that of the adjoining parishes. Since the introduction of Flax culture, this state of things has passed away. There is not a pauper in the parish; the poor-rates are nominal; there is not one able-bodied labourer, nor any portion of his family, who may not obtain constant employment throughout the whole of the year, and the moral and social state of the village will bear comparison with most. If the growth of Flax can produce results elsewhere similar to those which I have witnessed at Trimingham, there can be no doubt that the sooner it is cultivated to a greater extent in this country, the sooner will the enormous burden of pauperism decrease; and happiness and contentment be more generally diffused among the large masses of our labouring population.

The Chevalier CLAUSSEN then laid before the Council the following different specimens:

1. Samples of Flax in the straw, pulled and rippled.
2. Sample of Flax-straw, prepared according to the new process, adapted for linen manufactures.
3. Sample of long fibre scutched from part of No. 2.
4. Samples of Flax-fibre, adapted for spinning on cotton machinery.
5. Sample of yarn spun on cotton machinery, some from all the above Flax-fibre, others mixed in various proportions with the American cotton; these mixtures being termed by the inventor Flax-cotton.
6. Samples of Flax-fibre prepared for mixing with wool.
7. Samples of yarn produced on ordinary woollen machinery, composed of wool and Flax in various proportions, termed by the inventor Flax-wool.
8. Samples of flannel woven from the above.
9. Samples of fine cloth woven from yarn composed of Flax and fine wool in various proportions.
10. Flax-fibre prepared for mixing with silk, and dyed of various colours.
11. Flax-fibre mixed with spun silk, and termed by the inventor Flax-silk.
12. A sample of yarn produced from the above.
13. Samples of Flax-cotton yarn dyed of various colours.
14. Samples of cloth woven from Flax-cotton yarn and wool, dyed.

The following are the advantages detailed by the Chevalier Claussen and his friends, as possessed by the new process over the old methods:

1. That by the Chevalier Claussen's process the preparation of long fibre for scutching is effected in less than one day, and he always produces a fibre uniform in strength and entirely free from colour, much facilitating the after process of bleaching either in yarns or in cloth.
2. That he can also bleach it in the straw at very little additional expense of time or money.
3. That the former tedious and uncertain modes of steeping are superseded by one perfectly certain with ordinary care.
4. That in consequence of a more complete severance of the fibres from each other, and also from the bark and boon, the process of scutching is effected with half the labour usually employed.

[These advantages referred to that portion of the invention that includes the preparation of Flax for spinning upon the ordinary Flax machinery, and suited to existing markets. The further advantages have reference to the creation of new markets for British produce.]

5. That by the new process Flax is rendered capable of being spun, either in whole or in part, on any existing spinning machinery.
6. That the fibre, to be mixed with cotton, or spun alone on cotton machinery, is so completely assimilated in its character to that of cotton, that it is capable of receiving the same rich opaque colour that characterises all dyed cotton; and, consequently, any cloth made from Flax-cotton yarn can be readily printed, dyed, or bleached by the ordinary cotton processes.
7. That Flax-fibre can be always produced with profit to the British grower at a less price than cotton can be imported into this country with profit to the foreign producer.
8. That as a consequence of this advantage, the manufacturers of this country will be less dependant on the fluctuations of the cotton crop for a supply of the raw material, and a more regular employment will be given to the manufacturing population, and the present amount of local rates be greatly diminished thereby.
9. That the British grower will derive great benefit from a supply of the wide demand thus opened to him.
11. That with respect to the advantages of being able to spin Flax in combination with wool on the existing woollen machinery, the first is, that the Flax prepared by M. Claussen is capable of being scribbled, spun, woven, and milled, in all respects as if it were entirely wool; having an advantage in this respect over cotton, which has not the slightest milling properties; on the contrary the Flax-fibre is capable of being even made into common felt hats with or without an admixture of wool. To such an extent has the milling properties of Flax been proved, that the sample of cloth exhibited had been woven to 54 inches wide, and milled up to 28 inches wide.
12. That the Flax-fibre will not, under any circumstances, when prepared for spinning with wool, cost more than from 6*d.* to 8*d.* per lb., while the wool with which it may be mixed will cost from 2*s.* to 4*s.* per lb.; consequently reducing the price of cloth produced from this mixture 25 or 30 per cent. below the present prices of cloth made wholly from wool, and being of equal, if not greater durability.
13. That short-wool refuse, which cannot by itself be spun into a thread may, by being mixed with this thread, be readily spun and manufactured into serviceable cloths.
14. That there is a probability of a further demand being opened up for this fibre in the flannel and woollen trade.
15. That by this process Flax may be also so prepared as to be spun in any certain proportions with silk upon the existing silk machinery; that when so spun, it is capable of receiving considerable brilliancy of tint. That the fibre may be prepared for thus spinning at an uniform price of from 6*d.* to 8*d.* per lb. That as it may be spun in any proportions with silk, it is evident that the price of the yarns must be reduced according to the relative proportions of the materials employed, thus extending the markets, and giving increased employment to the operatives.
16. That, by M. Claussen's process of bleaching, any useless Flax can be converted into a first-rate article for the paper-maker, at a less price than the paper-maker is now paying for white rags; and suitable for the manufacture of first-class papers.

In conclusion, M. Claussen and his friends had no doubt that a plan might be devised by which the grower of Flax should derive not only the benefits he would obtain from the sale or consumption of his Flax seed, and the sale of his straw, as stated in the paper read, and the further advantages to be derived by him from the partial separation of the woody part of the stem from the fibre, which would reduce the cost of transit, and provide for a larger return to the land. But also the larger profit to be derived from the transforming of the straw into fibres suitable for any of the purposes above described, according to the suggestions pointed out in the paper read to the meeting, and thus secure to themselves that double profit which, under the present system, it was all but impossible for them to obtain.

## Calendar of Operations.

### FEBRUARY.

DORSET FARM, *Feb.* 3.—Since the last report we have had the weather very wet, and work has been kept back very much; and if it had not been previously well forward we would now be looking forward to a busy spring. But we have been contented to let the fields rest for a time. Grass is now growing fast, especially the water meadows, which look beautiful; and Wheat is good everywhere on land that lies dry, although on some of the low lying parts it is a little checked by excess of moisture; and if dry weather were to succeed rapidly it would no doubt suffer materially. Food of every kind is very plentiful. We are now taking up all our Swedes, as they are now making their second growth. We drive them together in heaps, about 6 feet wide, as high as they will pile up, and cover them with straw. We have now about half of our ewes lambed, and the lambs have hitherto done very well, although the weather has not been favourable. Our sows are now beginning to farrow. I think I mentioned before that they have had nothing but Mangold Wurzel since their last young were weaned; and as some of your correspondents say that such feeding is apt to slip their young, I can say that we have found nothing of that, and we have had 22 sows living entirely on them. And although we keep so many, we have not, in the course of five years, had one slip. Pork is selling very low, not more than from 6*s.* 6*d.* to 7*s.* 6*d.* per score, and in this locality hardly to be got rid of at that. And we find it far more profitable, even with grain so low in price, to sell them lean; for I have no doubt that in the lean state they sell at more per score. *G. S.*

SOMERSETSHIRE FARM, *Feb.* 1.—If not trespassing on the space of your paper, I wish to send a few papers on the subject of "land most applicable to the growth of Wheat and other crops," which are, in fact, more for the assistance of beginners and amateurs in farming, than claiming any credit for throwing much new light on the subject; my only idea being to make a change from the mere Calendar which I have sometimes communicated. To take the subject of Wheat, then, for our first paper:—The land most suited for Wheat is a deep and rather heavy soil; clays, well drained, being peculiarly adapted for it, and also for Beans, which on some lands are grown alternately, in which case a winter's fallow is requisite. Supposing Wheat after Beans, the land should be ploughed up as soon as ever the Beans are off; after harvest a good dressing of manure laid on, or, as is the custom in some districts, sheep folded on "muckle," as the term is, which plan must depend on a dry season. It is, however, safer to take a green crop between, such as Vetches or Clover. For example—Beans, Vetches, Wheat, Clover, mown first, and fed with sheep in July. On light sandy soils, such as the county of Norfolk, the land is (as indeed we think the best general system) cultivated on the 4-course shift of Turnips, Barley, sown down with Clover, 4th Wheat, which is said to succeed after the latter "on one earth," as the term is, better than anything, if we except in some cases Mustard. The rather frequent recurrence of Clover, however, makes it advisable to substitute Grass seeds or Tares every fourth year, taking Clover only every eighth; as the land, if sown oftener with it, becomes, as the well known term is, "Clover sick." Where the land is poor, such as on the stone-brash kind, as it is called, a more irregular system necessarily presents itself, and the following course I suggest from my own experience of the plan pursued on the farm in this county, mentioned in my last report, which partook of the above-named description of land belonging to the estate of Mr. Dickinson, late M.P. for that division, which is farmed by his agent in a very superior manner. On this soil Vetches were much cultivated, both as a good preparation for Wheat, and to follow it; in each case on this farm it was well folded with sheep (a sufficient quantity of which should always be kept, as they render the soil firm and compact for Wheat, and by the goodness of their manure, almost insure a crop, presuming the land to be previously well drained. They should for that purpose, to save much trouble, be wethers, the Southdowns being well suited for it, in these parts, from their hardy nature; the above was the system pursued on Mr. D.'s farm. To continue; on the heavy clays, when the weather is wet, sheep must be taken off, as though their folding on the above-mentioned light soils do good, of course, on the latter the reverse would be the case. Not that I advocate folding to extremes in any case. I think where practicable, an outlet from the fold on Grass, &c., is very desirable during the day; also when sheep are being fattened up for sale, they may be withdrawn in small lots from the fold; perhaps, where possible, under cover at home, as occasion requires. Another course on the farm I above alluded to was taking Turnips after the Vetches, thus folding off two green crops in succession, and doubly improving the land. If the Turnips were off the land in time, on this farm, the Wheat was put in during winter, the ground being very thinly ploughed, to nicely cover in the manure and Turnip refuse; in other cases the Wheat was sown in spring. Another way is, as on the above-named farm, to take Mustard, as a preparation for Wheat, which whether fed or ploughed in, answers well on most lands. It grows to a great height, and is little affected by frost; the sheep, however, when on it, do better when they have an outlet during the day "in their walk," as Mr. John Gray (Mr. D.'s agent), states in his description of the growth of white Mustard, addressed in a letter to Mr. Philip Pusey, which appeared in the "Royal Agricultural Journal." With regard to the time for Wheat sowing, there is, of course, as well as in the quantity to be sown per acre (and whether dibbled or drilled, or whether dug for or ploughed), much diversity of opinion. My own is, that at any rate on poor land as on the stony description I mentioned, the first fortnight in November is soon enough, and the quantity of seed per acre six pecks. On Mr. Dickenson's estate, where I resided two years, the yield of Wheat was commonly 40 bushels per acre, and much of this grown on poor stony land (varying in some parts to heavy loam with a hard clay subsoil): this I am sure is greatly owing to the constant folding of large flocks of sheep, as a few years ago when the farm was under other hands, with a ewe flock and no folding, there was, I have been told, not more than 25 bushels of Wheat to the acre, if so much. With respect to the method of depositing the Wheat crop; whether dibbled or drilled, &c, as I have not seen much of the former system pursued, I can only answer for drilling, which I can at any rate place before broadcast sowing, in most cases, as being a more regular and business-like plan. Dibbling, I should think, would hardly answer on large farms, or the spade in a backward season, when the fallows wanted getting forward for sowing. Beans are, in my opinion, best dibbled, with regard to their more effectual hoeing in spring; in this plan we may also class (though a very dissimilar crop) Mangold Wurzel. We used to drill the Beans on Mr. D.'s farm at 27 inches apart, and when planted at about 12 inches; quantity by dibble, two bushels for winter Beans, and a sack for spring; by the drill, from six to eight pecks. In concluding this short summary I wish to ask you, or some of your intelligent correspondents, if they could give me any account and explanation of draining land by steam, as practised in Lincolnshire Fens, and other levels; as to how the water is got rid of, and other particulars. As I stated in last report, we have a large extent of land, something similar to fen land, which, in such wet weather as we have lately had, becomes much inundated with water. It is about 2½ miles from the Bristol Channel—different plans have been promulgated, such as canals, &c., like on the east coast of the Fens, and latterly the idea of steam draining, which I take it would put the county to some expense. I should feel obliged by any account of the system in any of its bearings. *H. E.*

## Notices to Correspondents.

BARLEY: *A B.* You need not fear that it will give the scab. It is good food for sheep.

BOOKS: *W B Harvard.* Johnson's "Modern Cowkeeper," a shilling book, may answer your purpose. We do not know the bituminous shale manure, and must therefore depend upon any information with which correspondents may favour us.

COTTAGES: *One who has been a grieved witness of the unworthy Cottages of the Poor.* We have received enquiries about your plan, which was not explicit enough to make any intelligible woodcut. Please specify rent and cost of such a cottage—and you would oblige many readers by giving us a scale.

DRAINS: *C M K.* Under your circumstances we would cut off the upper spring water, by a cross drain at the top of the field, and drain the rest 3 feet deep (or half a spit *into* the dry bed below) and 24 feet apart. The impervious subsoil at that depth proves its impermeability by its perfect dryness; and in that case it seems useless to penetrate it.

FOOD FOR COWS: *Spes.* In a mild climate, or deep calcareous soil, Lucerne is a first-rate crop. But under the ordinary conditions of climate and soil we should prefer Italian Rye-grass and the annual cultivation of the soil to Lucerne, and six or seven years' rest. Italian Rye-grass may be sown in June if you choose, 3 or 4 bushels an acre. Lucerne should be sown in 14 or 16 inches wide shallow drills; about 10 lbs. of seed being used per acre.

HUSK OF OATS: *J J.* The average of two specimens examined by Professor Norton was—

| | |
|---|---|
| Oil ... ... ... ... ... | 1.21 |
| Sugar and Gum ... ... ... | 0·61 |
| Gluten ... ... ... ... ... | 1.88 |
| Cellulose ... ... ... ... ... | 89.57 |
| Saline matter ... ... ... ... | 6.7 |
| | 100.00 |

MALT DUST: *T P.* It has been applied with success as a top-dressing to Barley and Wheat. It is well to moisten it with liquid manure first and let it ferment slightly. It contains 29 per cent. of nitrogenous compounds. Apply 20 or 30 bushels an acre in a drill manure; having first rotted it and then dried it up along with the superphosphate or other manure you are going to use for Turnips. You can buy it for 6*s.* or 7*s.* a quarter.

"MR. SHORT'S PAMPHLET" ON FLAX. *R P Gardner.* Groombridge and Son.

SCOULAR'S GRUBBER: *Anon.* "Scoular, Haddington," will find him.

SUBSTITUTE FOR LITTER: *L A.* Boards and *attention.* Sawdust. Sand has been used. Cocoa-fibre matting would be costly to begin with, and so far destructible as to make it costly in the long run also.

THE BEST DRILL FOR SOWING TURNIPS ON FLAT GROUND, AND GUANO AT THE SAME TIME: *J R P.* Any of the Suffolk drills will do it. Garrett's, of Saxmundham; or Hornsby, of Grantham.

THE DRAINAGE ACT: *A Friend to Draining.* We cannot publish any personal attack unless authenticated by the name and address of the correspondent; and we will not do so unless some useful end is to be attained.

TOLLS: *T B Harness.* A chaff-cutter is no doubt toll free to the farmer; that is in going from place to place for *use.* The article you refer to related we think to guano.

ERRATA: For "all of them," in line 19 from the bottom of column *b*, page 73, read "one of these."—In the "Trip to North Devon," published Feb. 1, for "ruined hills," read "round hills." And observe the amended punctuation in the following sentence. "If the land is in stetches it would be desirable to mark the lines with the drill. Where no manure could be spared the mould and superphosphate were alone used at a cost of 20*s.* per acre."

## Markets.

COVENT GARDEN, FEB. 15.

Hothouse Grapes are all but over for a season. Pine-apples are still dear, and the supply of good dessert Pears is limited. English Apples are scarce, but foreign ones are sufficient for the demand. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. Forced Vegetables of all kinds are abundant and good, except French Beans, which are scarce, but which are, nevertheless, rather more plentiful than they were last week. Carrots and Turnips are good in quality, and so are Potatoes. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1*s.* per pottle. Cucumbers, though good, meet with an unusually dull sale. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Tulips, Double Primroses, Cinerarias, Moss and Provins Roses, and the different kinds of spring bulbs.

### FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 6*s* to 8*s* | Lemons, per doz., 1*s* to 2*s* |
| Grapes, hothouse, p. lb., 6*s* to 10*s* | Almonds, per peck, 6*s* |
| — Portugal, p. lb., 8*d* to 1*s* | — sweet, per lb., 2*s* to 3*s* |
| Pears, per doz., 2*s* to 5*s* | Chestnuts, per peck, 2*s* to 5*s* |
| — per half sieve, 6*s* to 15*s* | — per 100, 9*d* to 1*s* 6*d* |
| Apples, *dessert*, per bushel, 6*s* to 10*s* | Nuts, Barcelona, per bush, 20 to 22*s* |
| — kitchen do., 5*s* to 8*s* | — Brazil, p, bsh., 12*s* to 14*s* |
| Oranges, per doz., 9*d* to 2*s* | Cobs, per 100 lbs., 70*s* to 75*s* |
| — per 100, 6*s* to 10*s* | |

### VEGETABLES.

| | |
|---|---|
| Brussels Sprouts, p. hf. sieve, 1*s* to 1*s* 6*d* | Shallots, per lb., 6*d* to 8*d* |
| Cabbages, per doz., 6*d* to 1*s* | Garlic, per lb., 4*d* to 8*d* |
| Greens, p. doz. bun., 1*s* 6*d* to 2*s* 6*d* | Artichokes, Jerusalem, p. half sieve, 1*s* to 1*s* 6*d* |

POTATOES.—SOUTHWARK, Feb. 11.

The Committee report that the arrivals coastwise and by rail have been very considerable, which with several from France has made the supply large; trade is heavy, and it is only with a few of the best samples our top quotations are realised. The following are the prices:—York Regents, per ton, 70s. to 100s.; Scotch do., 65s. to 80s.; ditto Cups, 50s. to 70s.; Cambridgeshire whites, 50s. to 80s.; French whites, 50s. to 65s.

SMITHFIELD, MONDAY, Feb. 10.

The supply of Beasts continues to be very good, and the trade does not at all improve. There are several left unsold, and many of excellent quality are sold under our top quotation, although that is pretty readily given for anything very choice. The number of Sheep is small, and readily disposed of at fully late rates. Choice Downs, in a few instances, make rather more money, Calves are not so plentiful, and rather dearer. From Holland and Germany there are 357 Beasts, 1080 Sheep, and 99 Calves; from Norfolk and Suffolk, 2100 Beasts; from Scotland, 500; and 400 from the northern and midland counties.

| | | | | | Calves ... ... | 3 | 4 | — 4 | 8 |
| | | | | | Pigs ... ... | 2 | 8 | — 3 | 6 |

Beasts, 3851; Sheep and Lambs, 18,170; Calves, 139; Pigs, 320.

FRIDAY, Feb. 14.

We have only a small supply of Beasts on offer; trade is, however, so exceedingly bad that these cannot be disposed of. A few choice qualities meet with purchasers at about Monday's quotations, but all other kinds are lower. The number of Sheep is large enough for the time of year; they are freely sold at fully late rates. Trade is very slow for Calves at lower prices. Our foreign supply consists of 148 Beasts, 470 Sheep, 133 Calves, and 10 Pigs; we have 80 milch cows from the home counties.

MARK LANE.

MONDAY, Feb. 10.—The supply of Wheat to this morning's market by land carriage samples was unusually small, and the condition being generally bad, the greater part remained unsold at a late hour, although a slight reduction would have been acceded to in order to clear the stands. In foreign, business was extremely limited, too much so to allow of any alteration in price.—We reduce our quotatious 1s. per qr. on Barley of all descriptions.—Beans support their previous value. —Peas of all sorts are 1s. per qr. lower.—The Oat trade is heavy at a decline of 6d. per qr.—Flour is also difficult of disposal, and secondary descriptions of foreign the turn cheaper.

FRIDAY, Feb. 14.—This week the arrivals of grain of all sorts have been good. This morning the indisposition to purchase continues unabated, and prices of all descriptions of corn must be written nominally the same as on Monday, although to make progress with sales to any extent it would be necessary to accept lower prices on each. The same applies to Flour.—A cargo or two of Polish Odessa Wheat afloat have been sold at 33s. per quarter.

LIVERPOOL, TUESDAY, Feb. 11.—The supplies of grain, &c., from Ireland this week are again small, but of Barley and Malt coastwise, fair quantities have come to hand. The import of foreign Wheat is more moderate than of late. The attendance at our Corn Exchange this morning was slender, and the demand for Wheat and Flour again very limited; nearly all sorts of the former declined 2d. per bushel from the rates of this day se'nnight, and Flour also 1s. per sack and barrel. Oats were ½d. per bushel, and Oatmeal 3d. per load cheaper, with a slow sale. Barley, Beans, and Peas stand nominally as before quoted. There was a little more doing in yellow Indian Corn, at a reduction of 6d. per qr. No white corn at market.——FRIDAY, Feb. 7.—The arrivals of grain, &c., since Tuesday are moderate, and consist chiefly of Flour and Wheat from France. Prices have not varied the last two days, and the demand has been very sluggish. The operations at our Corn Exchange this morning were quite in retail. As regards Wheat and Flour, the price inclined to the buyer, but no quotable reduction was noticed. Indian Corn was in slack demand, and the top price of Tuesday was barely supported. No change was observable in the value of any other article of the grain trade.

HARTLEY'S PATENT ROUGH PLATE-GLASS FOR CONSERVATORIES, &c.

See Article in the GARDENERS' CHRONICLE of Saturday, December 8, 1849.

"Continued experience leaves us no room to doubt that this is the best material yet produced, and that it will in time supersede glass of all other kinds for the greater part of Gardening purposes." . . . "As for the article substituted for Rough Plate . . . it is wholly unfit for any horticultural purpose." . . . "The best sample of it which we have yet seen was Manufactured by Messrs. HARTLEYS, AND SOLD BY MESSRS. JAMES PHILLIPS & CO., 116, BISHOPSGATE STREET."

Supplied Wholesale, Retail, and for Exportation; cut to order in panes of

8 by 6 under 10 by 8.....4½d.; 10 by 8 under 14 by 10.....5d.
14 by 10 under 1½ foot, not above 20 inches long ...5½d.

COGAN and Co. were honoured with the Silver Medal of the Dublin Society, as also the Silver Medal of the Liverpool and Manchester Society held at Warrington in September last.

For Estimates, Prices, and further particulars, please address Messrs. COGAN and Co., 48, Leicester-square, London.

Glass Shades, Gas Glasses, White Lead, Colours, &c., as usual.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2d. to 2d. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES; AND PLATE GLASS FOR DWELLINGS.

THOMAS MILLINGTON begs to hand the sizes of a large quantity of SHEET GLASS, packed in 100 feet boxes.

6 by 4 ins., 6 by 4½ ins., 6½ by 4 ins., 6 by 5½ ins., 6½ by 5 ins., 12s. each.

6½ by 5½ ins., 6 by 6 ins., 6½ by 6 ins., and under 8 by 6 ins., 13s. each.

9 by 7 ins., 9½ by 7½ ins., and 10 by 8 ins., 15s. each.

Large sizes, 16 oz., 2d. and 2½d. per foot.

Large sheets, in 200 and 300 feet cases, 2½d. to 2¾d. per foot.

16s. per box; or 2¾d. per foot if less than one box be taken:

| | | | | | |
|---|---|---|---|---|---|
| 11 inches by 8 inches | | | 13 inches by 9 inches | | |
| 12 ,, | by 8 | ,, | 12 ,, | by 10 | ,, |
| 12 ,, | by 9 | ,, | 14 ,, | by 10 | ,, |

Boxes charged 1s. each extra.

T. M.'s Stock of small Glass is so large, that he thinks he can pledge himself to execute orders to any extent.

Glass cut to any other size required, in either 16 oz., 21 oz., 26 oz., or 32 oz.

ROUGH PLATE GLASS.

Rough Plate Cast, perfectly flat and uniform, the best manufactured. A small sample will be sent, upon application, to prove it.

Purchasers must be cautious, as some of the articles sold under this name are of the most inferior description, being full of fire-flaws, and the metal not properly united. We only recommend the best article, being sure that no other in the end can please. Some unprincipled vendors keep good samples to show, sending afterwards the inferior, described as above.

GLASS SHADES FOR ORNAMENTS.—Our price is 25 per cent. less than any house in the Trade, and the colour far superior, which must be preferable for ornaments.

LACTOMETERS for trying the quality of Milk: four tubes in frame, 6s. each. Wasp Traps, 3s. per dozen. Stands for Pianofortes, 9d. each.

MILK PANS 2s. to 6s. each, Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2d. each; Cucumber Tubes, 1d. per inch; Peach Glasses, 10d. each; Pastry Slabs; Glass Plates, in wooden frames, for butter and pastry, &c.; Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

N.B. The moderate charge of 1s. for each packing case will be made, which we think will be an inducement for parties to retain them; but if sent back free of expense the whole will be allowed.

THOMAS MILLINGTON, GLASS, COLOUR, AND PAINT MANUFACTURER, 87, BISHOPSGATE-STREET WITHOUT, LONDON.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

IRON GATES, HURDLES, &c.

THOMAS PERRY AND SONS, 252, OXFORD-STREET (NEAR HYDE-PARK), And Highfields Wrought and Cast-iron Works, Bilston, Staffordshire, Manufacturers of every description of Park Entrance, Carriage and Field Gates, Wickets, &c.; Plain and Ornamental Fencing and Palisading; Ox, Cattle, Sheep and other Hurdles; Tree Guards, Garden Seats, Hay Racks, Wheelbarrows; Land and Garden Rollers, Stable Fittings, &c. &c.

The works being situated in the centre of the Staffordshire Iron district, THOMAS PERRY AND SONS are enabled to execute promptly orders to any extent with the greatest facility, of the best quality, and most moderate terms. A great variety of the above articles always kept in Stock at the London Warehouse, and at the Works. Drawings and prices may be obtained on application, or furnished free by post.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

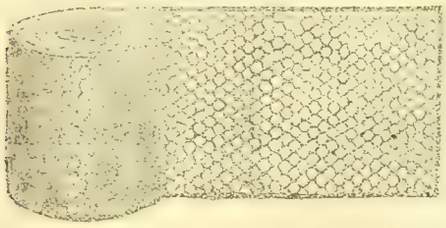
The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

BEAUTIFYING AND PRESERVING THE HAIR.—To preserve the human hair has been for a long time the unsuccessful pursuit of innumerable chemists and naturalists, and although there have been various compounds professing to accomplish this desirable end, still nothing really capable of restoring and preserving one of the most beautiful of Nature's gifts was discovered until 1821, when the result of a series of experiments, tried for a long previous period upon persons of all constitutions, fully established the infallible virtues of

C. AND A. OLDRIDGE'S BALM OF COLUMBIA.



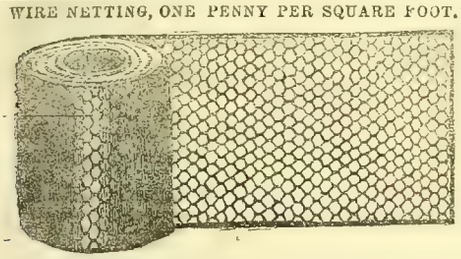
The wonderful efficacy of this inestimable compound in restoring the hair to its pristine beauty, and the certainty with which its conservative agency operates in preserving it, has received, as might be expected, the most flattering testimonials from the grateful thousands who have experienced its effects.—3s. 6d., 6s., and 11s. per bottle; no other prices.—When you ask for OLDRIDGE'S BALM, never let the shopkeepers persuade you to use any other article as a substitute.—13, Wellington-street North, Strand, a few doors above the Lyceum Theatre, on the opposite side.

METCALFE AND Co's NEW PATENT TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1s. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co's, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2s. per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

GALVANISED WIRE GAME NETTING.—
7*d.* per yard, 2 feet wide.

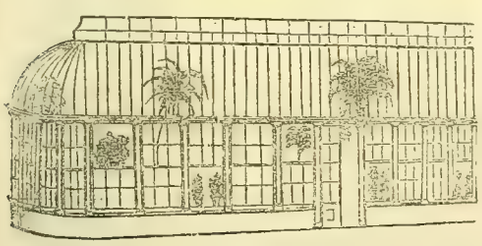


| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24-inch wide ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, strong ,, ... | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, ... | 12 ,, | 9 ,, |
| 1½-inch ,, light ,, ... | 8 ,, | 6 ,, |
| 1½-inch ,, strong ,, ... | 10 ,, | 8 ,, |
| 1½-inch ,, extra strong ,, ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.



GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | |
|---|---|---|---|
| 12 inches wide | 3*d.* per yard. | 30 inches wide | 7½*d.* per yard. |
| 18 ,, | 4½*d.* ,, | 36 ,, | 9*d.* ,, |
| 14 ,, | 6*d.* ,, | 48 ,, | 1*s.* ,, |

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER to their Country Mansions.

Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour is capable of lifting water to 30 times the height of the waterfall by which it is worked.

THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED; and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs. EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the Works in the Grove, Southwark, London.

FLAX AND FLAX COTTON.

FARMERS, Manufacturers, Unions, and Parishes, desirous of taking Licenses for preparing Flax on the economical and expeditious process of Chevalier CLAUSSEN, may now apply to Mr. J. S. CHRISTOPHER, 26, Gresham-street, London.

IRISH PEAT CHARCOAL.
TO FARMERS, AGRICULTURISTS, AND OTHERS.

THE IRISH AMELIORATION SOCIETY beg to draw the attention of the public generally to the fertilising and deodorising properties of Irish Peat Charcoal. Mixed with night-soil or sewage matter it instantly and wholly destroys all offensive smell, renders it easy of manipulation, adapts the fertilising properties as a ready food for plants, and enables it to be transported by Railway or any other conveyance without the slightest inconvenience.

The extent to which Charcoal (carbon) enters into the composition of every article of agricultural produce, and the value of night-soil as a manure, render any observations on these points unnecessary. Mixed with night-soil, in about equal weights, a most efficacious manure is produced at a very small cost.

Price of the Charcoal, ready for use, at Dublin, exclusive of sacks, 35*s.* per ton; in London, Liverpool, Bristol, and other seaports in England 48*s.* per ton, exclusive of sacks; or 60*s.* per ton, sacks included.—Agents for the sale of the Society's Charcoal have been appointed at several of the principal seaports and Inland towns, a list of whom, together with all other information, may be had on application at this office.

By order of the Court,
Feb. 15, 1851. GEORGE L. PARROTT, Secretary.
Head Office, 9, Waterloo-place, London.

MANURE DEPOT.—PEAT CHARCOAL.
TO FARMERS, AGRICULTURISTS, AND OTHERS.

G. H. FOLEY, Essex Coal Wharf, Lea-bridge, Middlesex, Agent by appointment to the Irish Amelioration Society, for the sale of the above. All needful particulars will be given on application at the above address.

Price of the unmixed Charcoal, 48*s.* per ton, exclusive of sacks; or 60*s.* per ton, sacks included. Mixed with Nightsoil, 45*s.* per ton, sacks included.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.
Incorporated by Act of Parliament, 12 and 13 Vict., c. 91.
*Directors.*

HENRY KER SEYMER, Esq, M.P., Hanford, Dorset—Chairman.
JOHN VILLIERS SHELLEY, Esq, Maresfield Park, Sussex—Deputy-Chairman.

| | |
|---|---|
| John C. Cobbold, Esq., M.P. | Edward J. Hutchins, Esq., M.P. |
| William Cubitt, Esq. | Samuel Morton Peto, Esq., M.P. |
| Henry Currie, Esq., M.P. | Colonel G. A. Reid, M.P. |
| Thomas Edward Dicey, Esq. | William Tite, Esq., F.R.S. |
| William Fisher Hobbs, Esq. | William Wilshere, Esq. |

The Company is empowered to execute—1. All works of Drainage (including Outfalls through adjoining Estates,) Irrigation, Reclaiming, Enclosing, and otherwise improving Land.

2. To erect Farm Homesteads, and other Buildings necessary for the cultivation of Land.

3. To execute Improvements, under contract, with Commissioners of Sewers, Local Boards of Health, Corporations, Trustees, and other public bodies.

4. To purchase Lands capable of Improvement, and fettered by restrictions of Entail, and having executed the necessary works, to resell them with a title communicated by the Company's Act.

All owners of Entailed Estates, Trustees, Mortgagees, Corporations, Incumbents, Life Tenants, and other persons having only limited interests may obtain the use of the Company's powers to carry out every kind of permanent Improvement, either by the application of his own or the Company's funds, secured by a yearly charge on the property improved.

Proposals for the execution of Works to be addressed to 52 Parliament-street, London. WILLIAM CLIFFORD, Secretary.

FARMS AT STANTON FITZWARREN, NEAR HIGHWORTH, WILTS.

To view the Farms, and for further particulars, apply at Stanton House, near Highworth, Wilts. Sealed Tenders to be sent, addressed to the Rev. J. A. TRENCHARD, at the same place, on or before the 25th March next.

February 15.

TO MARKET GARDENERS, NURSERYMEN, AND OTHERS.

TO BE LET, and entered on immediately, about 2500 feet of GLASS, well stocked with excellent young Vines, just coming into full bearing, and a choice collection of Orchidaceous, Stove, Greenhouse, and Hardy Plants, fit for immediate sale; with a neat COTTAGE, and 6 or 7 acres of Land, as may be convenient to a person taking the same, situated in a most sheltered and picturesque spot, about three miles from the increasingly populous town of Southampton, which communicates by railway with the metropolis, and all other parts of England. Some of the soil is peculiarly adapted for a Nursery of American Plants. The stock to be taken at a valuation.—For particulars, apply to JAMES TEE, Gardener, Aldermoor, near Shirley, Southampton.

GREENHOUSES, SECOND-HAND.

TO BE SOLD, a Lean-to, 15 by 12 feet; and a Half-span, 19 by 9 feet, fixed at Holloway. The above, which are fitted with Stage, Shelves, &c., and heated by hot water in the most complete manner, will be parted with at a great sacrifice, in consequence of the Proprietor removing. Apply to Messrs. STEPHENSON and PEILL, Hot-water Apparatus Manufacturers, 17, New Park-street, Southwark.

## *SALES BY AUCTION.*

BRENTFORD, MIDDLESEX.—FINAL SALE.
To Noblemen, Gentlemen, Nurserymen, Market-Gardeners, and others engaged in planting.

MESSRS. PROTHEROE AND MORRIS are instructed by the Executors of the late Mr. J. RONALDS to offer to public competition, by Auction, on the premises, the Butts and Twolands Nurseries, Brentford, Middlesex, on MONDAY, February 24th, and following day, at 11 o'clock. The whole of the remaining NURSERY STOCK, consisting of a rich assortment of Fruit and Forest Trees, Evergreens, Ornamental and Deciduous Shrubs, American Plants, &c. May be viewed, and Catalogues had (6*d.* each, returnable to purchasers), prior to the Sale, of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed to sell by Auction, at the Mart, Bartholomew-lane, on THURSDAY, February 27th, about 200 choice double Camellias, from 2 to 5 feet, well set with bloom buds; also a quantity of Lilium lancifolium, in varieties; a selected assortment of standard and dwarf Roses, American plants, comprising fine Hybrid Rhododendrons, Ghent Azaleas, Andromedas, &c.; together with a choice collection of Dahlias in dry roots. May be viewed the morning of sale, and Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

HIGHBURY NURSERY.
To Gentlemen, Nurserymen, Proprietors of Tea Gardens, &c.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, on the Premises, Highbury Nursery, opposite Highbury Barn Tavern, Islington, on MONDAY, March 3d, 1851, and following day, at 11 o'clock each day, by order of the Proprietor, in consequence of the land being let for building, the whole of the CHOICE NURSERY STOCK, consisting of fine Evergreens, Deciduous Shrubs, and Ornamental Trees; also, the selected Greenhouse Plants, comprising large Camellias, Azalea indica, large Araucaria, Rhododendron Arborea, Oranges, Myrtles, Ficus elastica, Geraniums, Fuchsias, Cyclamen, &c.; together with the Pits, Frames, and Lights, Hand-glasses, Wheelbarrows, a quantity of well seasoned Bog, Potting Mould, &c.; a Summer House; an Erection or Tea Booth, 36 feet by 18; Tables, Forms, Tea Trays, Crockery; 2 Coppers; a Swinging Boat; Utensils in Trade, &c. May be viewed prior to the Sale; Catalogues had, 6*d.* each, returnable to Purchasers on the Premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO NOBLEMEN, GENTLEMEN, AND NURSERYMEN.
UNRESERVED SALE OF CAMELLIAS OF THE CHOICEST DESCRIPTION, BOTH AS TO FORM OF THE PLANTS AND VARIETIES, FROM MESSRS. LODDIGES.

MR. J. C. STEVENS begs to announce for Sale by Auction, at his Great Room, 38, King-street, Covent-garden, on FRIDAY, February 21, at 12 for 1 o'clock, a remarkably CHOICE SELECTION OF CAMELLIAS, from Messrs. Loddiges' Nursery; comprising beautifully formed Plants, from 3 to 8 feet, well set with bloom, and of the following favourite sorts: Double White (very fine), Imbricata, Elegans, Donckelarii, Chandlerii, Candidissima, and a few flowering Plants of the rare and beautiful Aulica; also some fine specimens of Andromeda, Floribunda, Rhododendron campanulatum, &c.—May be viewed on the day prior and morning of sale, and Catalogues had of Mr. J. C. STEVENS, 38, King-street, Covent-garden.

SALE OF AMERICAN PLANTS AND OTHER NURSERY STOCK.

MR. D. A. RAMSAY will Sell by Auction, at the Brompton Auction Ground, Fulham-road, Brompton, (one mile from Hyde-park Corner) on TUESDAY, Feb. 18th, at 12 o'clock, 1000 Rhododendrons, Azaleas, Andromedas, Ledums, &c., in fine varieties; Evergreens, Ornamental Trees and Shrubs, a quantity of Bulbs, a choice collection of Pinks, Yellow and other Picotees and Carnations; 1000 Victoria and other Rhubarb roots, Fig Trees, strong Grape Vines, Mushroom Spawn, Ash-leaf Kidney Potatoes, &c.—May be viewed prior to the Sale, and Catalogues had at the principal Seedshops, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton, near London.

TO MARKET GARDENERS, NURSERYMEN, BUILDERS, AND OTHERS.

MR. D. A. RAMSAY will sell by Auction, on the premises, near the Wheatsheaf, New-road, Shepherd's Bush, Hammersmith (late in the occupation of Mr. John Day), on FRIDAY, February 21, at 12 o'clock, the Growing Crops on about five acres of ground, which must be immediately cleared for building; consisting of 1500 of the celebrated Rifleman Gooseberry, and other market varieties, British Queen and other Strawberries, Raspberries, Currants, Rhubarb Roots, Broccoli, and other Vegetable Crops, &c. Also a quantity of Nursery Stock, comprising fine Rhododendrons, Azalea, Hardy Heaths, Grape Vines, Fig-trees, Evergreens of sorts, Fruit Trees, Dwarf and Pillar Roses, Mushroom Spawn, &c., the property of a Country Nurseryman. The whole to be sold without the least reserve.—May be viewed one day prior to sale. Catalogues had at the Wheatsheaf, the principal Seedshops, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton, near London.

TO SEEDSMEN, FLORISTS, &c.

TO LET, an ESTABLISHED BUSINESS, in the main thoroughfare of a densely populous neighbourhood, doing a good retail trade in Seeds and Plants, with an excellent opportunity of increasing. The above contains a large showy Shop, four Rooms, &c. Rent only 18*l.* per year. Coming in for the whole, including Stock, Fixtures, &c., 60*l.* Present returns 300*l.* a year.—Apply to G. BALDWIN, 4 and 5, Greenwich road, Greenwich, Kent.

TO BE DISPOSED OF, in a fashionable Watering-place in the centre of England, a Small MILK ESTABLISHMENT, where 12 Cows are kept, together with the occupation of 25 Acres of Land, in a high state of cultivation; and also a Furnished Lodging House in a good part of the town.—Apply by letter, post-paid, to B. D., Office of this Paper.

HOSE FOR LIQUID MANURE, FIRE-ENGINES, and AGRICULTURAL PURPOSES, made of Canvas, lined and coated with Gutta Percha. It is about one-third the price of Leather or India Rubber; it will convey Liquids of all kinds under a heavy pressure, is extensively used at the Government Public Works, by the Navy, and amongst Agriculturists, giving universal satisfaction.—Testimonials and Prices may be obtained at Messrs. BURGESS and KEYS, 103, Newgate-street. London agents: Messrs. DEANE, DRAY and DEANE, Swan-lane; Messrs. TILLEY, Blackfriars-road.—Country agents:—Messrs. RANSOME and PARSONS, Ipswich; Messrs. J. and S. JOHNSON, Liverpool; Messrs. DICKSON, Hull; Mr. SAMUEL WILSON, agent for Scotland.

NURSERY GROUNDS, RED LODGE, NORTH STONEHAM, NEAR SOUTHAMPTON.—An unlimited supply of every description of FOREST, FRUIT, AND ORNAMENTAL TREES, AMERICAN PLANTS, AND FLOWERING SHRUBS, may be procured from these extensive grounds, at the most reasonable prices, printed Catalogues of which may be had of the proprietor, WM. ROGERS, Sen., NURSERYMAN AND CONTRACTING PLANTER.

Transplanted Forest Trees, 1 to 2 feet, adapted for extensive Forest or Coppice Planting, usually sold by the thousand; and also of a large size, for Ornamental Planting, or immediate effect, from 3 to 12 feet, 25s. to 5l. per 100.

Ash, Beech, Birch, 15s. to 30s. per 1000; Spanish Chestnut, 20s., 30s., and 40s.; Larch Fir, 7s. 6d. to 20s.; Spruce, 20s., 30s, and 40s.; Scotch, 10s, 15s., 20s.: Pinaster, 10s, 15s., and 20s.; Sea Pine, adapted for exposure to the sea, 15s., 25s., and 40s.; Mahonia, for cover, 40s. to 80s.; Hazel, 15s., 20s., and 35s.; English Oak, 15s., 20s., and 40s.; Poplar, 20s., 30s., and 40s. Quicks, 5s., 7s. 6d., and 10s.

Planting contracted for to any extent, from 5l. to 20l. per acre.

ORNAMENTAL TREES AND SHRUBS.

Rhododendron ponticum, 2 to 6 inches, 20s., 40s., and 80s. per 1000; 1 foot, single stems, fit for working, 10s. per 100; 1½ to 2 feet, strong, 20s. to 40s. per 100, fit for planting out at once for cover; 4 to 6 feet, single stems, for working the beautiful scarlet and other fine kinds, 50s. per 100. Tree Rhododendrons may thus become as generally cultivated as Tree Roses. Scarlet Rhododendrons, 18s. per dozen; hybrid scarlet, lilac, and white, with large handsome trusses of flowers, 4 to 6 inches, 25s.; 1 foot, 40s. per 100; Kalmia latifolia, 2 to 4 inches, 8s. to 12s. 6d. per 100; 1 to 2 feet, blooming buds, 50s. per 100; 2 to 3 feet, fine, 75s. per 100; Epigæa repens, 50s. per 100; and all other American plants at equally low prices.

Dwarf Rose Stocks for working, 8s. per 100; Single Camellias, 25s., 40s., and 50s. per 100, fit for working; Double Camellias, of sorts, on own roots, 6 to 9 inches, 12s. per dozen; Pinus (Abies) Douglasi, from seed, 18 inches to 2 feet, 60s. per dozen; Arbutus, 12 inches, 8s. per 100; 1½ foot, 20s. per 100; 2 feet, 30s. per 100; Laurel, 8s. to 20s per 100; Laurustinus, bedded, 40s. per 1000, 8s. per 100; Variegated Holly, 1 foot, 25s. per 100; Clematis azurea grandiflora, 6s. per dozen, 42s. per 100; Deutzia scabra, 2 feet, 12s. per 100; Common China Rose, 12s. 6d. per 100; Tree Roses of the most select kinds, 5l. per 100; Dwarf Roses, 50 sorts, named, 50s. per 100; Double White, Double Red, and New Crimson Thorns, 40s. per 100, 6s. per dozen; Large Dutch Honeysuckles, 12s. 6d. per 100; Giant Irish Ivy, 8s. per 100; 2 years seedlings, Scotch Fir, fine, 2s. 6d. per 1000; 1 years seedling Larch, 2s. 6d. per 1000; 2 years seedling Horse Chestnut, 12s. 6d. per 1000.

The prices are for wholesale; if ordered in less quantities a higher price will be charged. All orders above 5l., carriage paid to London.

American purchasers will find great advantages in procuring their supplies from these grounds, from their proximity to the Docks whence the American steam-packets take their departure, thus saving the delay and expenses of land carriage.

---

MESSRS. HAY, SANGSTER, AND CO. will be ready to supply their prepared POTATO CUTTINGS about the middle of April next, the produce of which proved so highly satisfactory last, as well as the experimental trials of the three former years, as to QUALITY, QUANTITY, and SIZE, being more than double the crop this year of those planted in the usual way, and containing a much larger quantity of starch, which is so essentially necessary to the preservation of that valuable root. A report of the analysis will be found below. Our own experiments give about one-third more saccharine matter than the best we could procure grown under the old system. All orders must be to hand on or before the end of the second week in April, as H. S. and Co. are preparing to plant a large breadth, and will only provide for what may be ordered up to that time. Post-office orders to be made payable to JOHN SANGSTER, at the Borough Post-office, Southwark. Printed instructions for planting and management will be sent with the plants ordered.

STANWICK NECTARINE—SALE OF, IN AID OF THE FUNDS OF THE GARDENERS' BENEVOLENT SOCIETY.

Circumstances have rendered it necessary to modify the intentions expressed at p. 676 of the *Gardeners' Chronicle*, respecting the STANWICK NECTARINE. Upon examining the young plants in Mr. RIVERS's hands, it turns out that the number fit for sale is much smaller than was anticipated, and that there is a considerable difference in their quality. Applicants are moreover anxious to obtain their plants without loss of time, and without waiting for the chance of an auction which cannot take place, to the advantage of the charity, sooner than next spring. It has therefore been resolved to set aside the finest plants for sale at from 4 to 5 guineas each, and to dispose of others at 3 guineas each. Such as are unsold in the spring, if there should be any left, will be brought to the hammer as at first proposed.

Of the selected specimens, some are beautiful plants in pots, budded on the Peach stock, and covered with blossom-buds, so that they will fruit next year if repotted; for these five guineas will be charged. The remainder are very fine maiden plants in the open quarter, budded on Plum stocks, and without blossom-buds; for these 4 guineas are required. Gentlemen desirous of aiding the excellent charity to whose funds the produce of the sale of these plants will be applied, by order of his Grace the Duke of Northumberland, are requested to apply to Mr. WILLIAM BRAILSFORD, 21, Regent-street, London, giving their exact addresses, and stating by what conveyance the plants are to be transmitted from the station at Harlow, on the Cambridge line of the Eastern Counties Railway, where they will be delivered without further charge. It is requested that Post-office orders may be made payable to Mr. WILLIAM BRAILSFORD, who, upon their receipt, will return an order upon Mr. RIVERS for the transmission of the plants.

Applications will be complied with in the *exact order* in which they are received, and due notice will be given when the five guinea and four guinea plants are exhausted.

May we be permitted to express a hope, that although no pecuniary profit can be derived by nurserymen from a sale whose proceeds go to a charitable use, yet that they will, nevertheless, endeavour to make known, within the circle of their customers, the terms on which the Stanwick Nectarine may now be procured.

---

SEED AND HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

BASS AND BROWN'S SEED and PLANT LIST for 1851 is now complete, and stamped as a newspaper, to go free by post. It is prefaced with a page of Instructions for SOWING and RAISING SEEDS, with allusions to Sorts requiring peculiar treatment, and contains the following:

PART I.—FLOWER SEEDS, consisting of lists of 422 new and most showy sorts, with colour, height, hardiness, duration of each, price per packet, and other useful information.

PART II.—VEGETABLE SEEDS, with time of sowing each kind, prices of each, and other descriptive information.

PART III.—AGRICULTURAL SEEDS, containing also much useful information.

PART IV.—ROOTS, FRUITS, BULBS, &c. for early planting.

PART V.—Contains our Descriptive Priced Catalogue Lists of Show, Fancy, Scarlet, and other Geraniums; Fuchsias, Dahlias, Petunias, Verbenas, Chrysanthemums, Cinerarias, Achimenes, Gloxinias, Azalea indica; Greenhouse, Stove, and Miscellaneous Select Plants.

PART VI.—Contains NEW PLANTS of 1851.

The following Collection will be highly approved:

VEGETABLE SEEDS.

| | £ | s. | d. |
|---|---|---|---|
| A collection in full proportion, one year's supply, for a large garden, of first-rate sorts, including 24 quarts of Peas, 6 quarts Broad Beans, 10 sorts Broccoli, 6 of Cabbage, 3 of Cauliflower, 8 of Lettuce, 5 of Onion, 5 of Radish, and all other sorts in proportion | 3 | 0 | 0 |

Remittances with orders are requested from unknown correspondents. Goods Carriage Free to London, and with all orders of 2l. and upwards, articles presented extra. Post-office orders payable to BASS and BROWN, or to STEPHEN BROWN.

---

NEW LAPSTONE KIDNEY POTATO.—This Potato is of first-rate quality, and has been highly spoken of by Dr. Lindley in the *Gardeners' Chronicle*, and also by every one that has grown it. It is a most abundant bearer, and the best in quality of any Potato grown, and keeps good up to May or June. They are of good size, and have been grown on warp land near the banks of the Trent, and therefore will be a good change for any other soil.

New Lapstone Kidney Potatoes, in sacks of 2 cwt., at 16s., sacks included.
Prince Regent, ditto, ditto, 10s.
Early Shaws, ditto, ditto, 9s.

Early orders accompanied by remittances will receive prompt attention.

WILLIAM STENT, Nursery and Seedsman, Stockwith, Gainsborough, Lincolnshire.

---

DOUBLE ITALIAN TUBEROSE ROOTS, 3s. PER DOZEN.

ROBERT HALL, 63, South Audley-street, Grosvenor-square, facing the chapel. Postage Stamps taken in payment.

R. H. begs to remark that his TUBEROSE ROOTS have been left in the ground a sufficient time to mature, instead of, as is too generally the case, being hurried out to secure an early market when only about one-half of them will bloom. Also small Yorkshire Breakfast Hams, 10d. per pound.

---

RENE LANGELIER, of the Clarendon Nursery, St. Helier, Jersey, begs to draw the attention of the Public to his still unrivalled collection of PEAR TREES, not yet surpassed in Europe, in which will be found all the very best varieties, insured for the season required. Trees may be had already formed, either pyramidal or for espalier, in unusually fine and healthy condition, such as will give the most ample satisfaction to both purchaser and R. L. The price has been much reduced, and the quantity of Trees R. L. possesses enables him to supply the trade with guaranteed sorts equal to any house on the Continent, having given the greatest satisfaction for several years. Foreign correspondents will find a very great advantage if the selection is left to R. L., as they will be cheaper, and none but the best sorts will be supplied.

R. L.'s Descriptive Catalogue, which has been found the best and most correct yet published, is only to be had at his Nursery, Jersey, price 1s. 6d. and 6d. extra for postage.

A very great reduction has been made in the transit by steamers to all parts of England, so that R. L. can supply Trees cheaper than any other grower.

A fine collection of Roses, Camellias, and yellow Picotees.

---

CAMELLIA STOCKS FIT FOR IMMEDIATE WORK.

RENE LANGELIER, Clarendon Nursery, St. Helier, Jersey, begs to inform the Public that he has a very extensive stock of the above, fit for immediate grafting, very clean and healthy, well rooted, so as to leave without the pot, consequently much less expense in conveying to any distant place. Price 36s., 40s., and 50s. per 100.

The Stock is such as has never before been offered to the Public by any grower.

R. L. has a most extensive collection of Double Camellias at a very moderate rate and reduced price, as will be seen by a Catalogue recently published, in which it is proved that they can stand the climate out-of-doors without protection. The Catalogue can be had of R. L. by inclosing four penny stamps. Remittance or reference from unknown correspondents.

---

ESCHOLTZIA ALBA.

JOSEPH EVANS has great pleasure in offering the above new and beautiful Annual, which he has flowered the last two seasons, and which has been greatly admired. J. E. begs to call attention to the favourable notice of it in the *Gardeners' Chronicle* of August 10, 1850, and the *Cottage Gardener* of August 15, 1850. J. E. will commence sending out packets of 20 seeds, at 2s. 6d. per packet, postage free, on and after Monday, February 17. A remittance from unknown correspondents is respectfully requested.

Rosina Garden, London-road, Cheltenham.

---

PERMANENT PASTURE.

HENRY ROGER SMITHE, of Eastling, Faversham, Kent, informs the Public that his mixtures of the Natural Grasses and small Clovers—excluding no sort which is proper to form a PERMANENT PASTURE, as the soil &c. may direct—are now ready; delivered on the railway free of charge, at 1l. per acre, allowing 3 bushels as seed for an acre; also Lawn Mixtures, and the sorts separate. They are gathered under his immediate superintendence, and are quite new; his unprecedented low price last year, and the prospects of agricultural ure, having created an unlooked-for demand,

---

PILTDOWN NURSERIES, MARESFIELD, SUSSEX.

JAMES MITCHELL begs to announce that he purposes sending out in May, in strong plants, his superb new Dahlias, also all the leading varieties of other growers.

MITCHELL'S QUEEN OF BEAUTIES.—This novel and extraordinary flower has one of the most rich and beautiful rose tips ever seen on a pure enamel white ground, two-thirds of a globe, with an outline smooth and round; very double, very symmetrical, the eye level with the surface, and has been admired by everybody who has seen it. It obtained a first-class certificate at the Royal South London Show, the Grand Annual Trial Show, at the Grecian Saloon, also at all the principal shows in Sussex and Kent—4 feet, 15s. per plant.

MITCHELL'S ELEGANTISSIMA.—This is also an extraordinary novelty, a fancy variety, marked with tortoiseshell, and perfectly unlike everything that has been seen before. This also had a certificate at the great Trial Show, on the round of its novelty—4 feet, 10s. 6d. per plant.

---

IMPROVED METALLIC FLOWER LABEL

ADVANTAGES OF THE IMPROVED METALLIC FLOWER LABEL OVER ALL OTHERS. They are less liable to disturb the roots; they are indestructible; they are uniform and ornamental; they are smoother, and can be written upon either with lead pencil on wet paint, as on wood, or with chemical ink. Price 2s. per 100.

May be had of T. LOCKHART, Seedsman, 84, Fleet-street, London; or Wholesale to Dealers, of S. ROOKE, jun., 7, Whitrall-street, Birmingham.

---

MELONS! MELONS! MELONS!

The finest flavoured in the world is the BROMHAM HALL, Green Flesh.

EDWARD TILEY respectfully informs the Nobility, Gentry, and Melon Growers in general that he has still a stock of good old Seed of this splendid Melon saved in 1848, and which has given universal satisfaction to all purchasers of last season. To prove its superiority of flavour over all other Melons, the following opinion has been given. It was forwarded to the Editor of the *Gardeners' Chronicle*, July 22, 1848, for his judgment, and he was of opinion that the Bromham Hall Melon was the finest flavoured he had ever tasted. It was exhibited at the Chiswick Exhibition, July 11, 1849, where it was awarded by the judges the Silver Knightian Medal for its luxuriant flavour. Again it was forwarded to Dr. Lindley, August 11, 1849:—"We have received your Bromham Hall Melon; it was much over-ripe, nevertheless it was by far the best flavoured Melon we ever tasted." It was exhibited at the Horticultural Society's Rooms, Regent-street, September 4, 1849, and pronounced by the judges to be the best flavoured Melon they ever tasted, and was awarded the Banksian Medal. On the 20th July, 1850, again exhibited at Chiswick, and obtained first and second prizes for its superior flavour. It was grown last season at the Horticultural Society's Gardens, London, by Mr. Thompson, superintendent to the fruit department, whose opinion was in accordance with the others. The fruit is very handsome, round shaped, hollow crown, beautifully netted, thin skin, and flesh very firm; a free setter and abundant bearer, weight from 3 to 4½ lbs. It may be as easily grown by an amateur in a frame as the common Vegetable Marrow; also retains its fine flavour for a considerable time after being cut. Sold in packets at the reduced price of 1s. 6d.; also the following other fine varieties can be highly recommended, all true old Seed:—

| | 1s. 0d. per packet |
|---|---|
| Camerton Court Green-flesh ... ... | 1 0 ,, |
| Queen Melon ... ... ... ... ... | 1 0 ,, |
| Blackall's Green-flesh ... ... ... | 1 0 ,, |
| Bailey's Green-flesh... ... ... ... | 1 0 ,, |
| Bowood Green-flesh... ... ... ... | 1 0 ,, |
| Beechwood Green-flesh ... ... ... | 1 0 ,, |
| Windsor Prize ditto... ... ... ... | 1 0 ,, |
| Emperor ... ... ... ... ... | 1 0 ,, |

| Duncan's Green-flesh do. Improved ... | 1 0 ,, |
| Hampton Court Green-flesh ... ... | 1 0 ,, |
| Egyptian do. do. Improved ... ... | 1 0 ,, |
| Coles' superb Celery ... ... ... | 1 0 ,, |

Any quantity of the above will be sent postage free to any part, but a remittance must accompany the order from unknown correspondents either by Post-office order or penny postage stamps.—Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath.

---

COCHIN CHINA FOWLS.—Cocks of the Cochin China breed, reared from the Prize Fowls, shown by Mr. Punchard, of Blunt's Hall, Haverhill, Suffolk, at the late Birmingham and Midland Counties exhibition, may be obtained of Mr. PUNCHARD, at Two Guineas each.

---

GREAT SALE OF NURSERY PLANTS.

PETER BOOTH, NURSERYMAN, Falkirk, is Selling off, at his very extensive grounds, a very large stock of Transplanted LARCH, SCOTCH, and SPRUCE FIR PLANTS, of strong and smaller sizes, including Seedlings, with a great variety of all the other kinds of Forest Trees, Shrubs, &c., generally grown in large Nurseries, of most excellent quality, and at prices much reduced.

---

GARDEN AND FARM SEEDS.

W. DRUMMOND AND SONS, SEEDSMAN, Stirling, Scotland, beg to announce, that they are now prepared to execute orders for the above from a large and carefully-selected Stock.

Their Catalogue of Vegetable and Flower Seeds may be had free, by post, on application. It will be found to contain only the names of such varieties as are really worth cultivating; and, from an accurate description being affixed to each, the Gardener and Amateur can have no difficulty in making a suitable selection. In reference to this Catalogue, the Editor of the *Gardeners' Chronicle* says—"It is simple, short, and one of the best we have seen. They are pursuing the sensible course we have so often insisted upon, for the sake of both seller and buyer."

Priced Lists of Farm Seeds are also ready, and may be had on application.

N.B. Parcels of Seeds are in most cases delivered carriage paid.

Agricultural Museum, Stirling, N.B.; and 58, Dawson-street, Dublin.

SURPLUS STOCK OF FOREST TREES, SHRUBS, AND FRUIT TREES, now on Sale at KENDLE'S NURSERY, Plymouth. See Advertisement, page 83, in this Paper.

Larch Firs, 3 feet, 18*s.* per 1000; very stout and fine Scotch Firs, 2 feet, 15*s.* per 1000.

THE PLANTING SEASON.—WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WM. WOOD AND SON having still on hand a very extensive and superior stock of ROSES, will be happy to supply collections as under (the selection of sorts being left to themselves). The plants are remarkably strong and healthy, and none but first-rate kinds will be sent.

| ROSES. | Per dozen. |
|---|---|
| Extra tall Standards, budded with from 3 to 6 best varieties on a stem | 42*s.* to 60*s.* |
| Extra superior selected Standards | 18*s.* to 24*s.* |
| Fine Dwarfs and Dwarf Standards | 10*s.* to 16*s.* |
| Superb do. do. (for exhibition) | 18*s.* |
| Fine Dwarfs, on own roots, in 50 varieties, per 100 | 50*s.* |
| Good do. do. without names, per 100 | 30*s.* |

N.B. A liberal quantity of plants will be given over with each order. Catalogues free on application.

Rose Nippers, of various sizes, for pruning, 2*s.* 6*d.* to 4*s.* each. The Nippers are of an improved shape, being made so as to remove a shoot without bruising the part left; they are highly recommended as a useful addition to the implements of amateurs. Metallic Labels for pot Roses, 2*s.* per 100.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE of Hardy Rhododendrons, Azaleas, Roses, &c., may be obtained gratis on application. It describes the colour of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections. He has many thousands of Rhododendron ponticum in sizes very suitable for planting immediately into Game Preserves, very healthy bushy stuff, price 5*l.*, 7*l.* 10*s.*, and 10*l.* per 1000.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway, and three miles from Blackwater, South-Eastern Railway.

CUCUMBER—"PHENOMENA."

EDWARD TILEY begs to offer to Cucumber growers generally the above superb CUCUMBER, which he feels confident will give the greatest satisfaction to them, as did the former kinds sent out by him during the last seven years, being Victory of Bath, Gordon's White Spine, and Lord Keynon's Favourite.

The above splendid Cucumber, "Phenomena," was a hybrid between Hamilton's Black Spine and Milla's Jewess, which it surpasses, both for its prolific qualities and length of fruit, generally growing from 22 to 28 inches. It is a beautiful black spine, of a dark green colour, and free from ribs or shrivels; it also grows quickly, carries its bloom well, and will be found first-rate for exhibition. As a proof of its prolific qualities and length, the following may be vouched for, viz.:—There were cut from two plants, grown in a one-light box, the size of which was 4 feet by 6, 24 brace of Cucumbers, each fruit averaging 22 inches long—total length of the whole amounting to 29 yards 1 foot. It is solid, and eats very crisp. Sold in packets containing seven seeds, 5*s.*; or three seeds, 2*s.* 6*d.*

E. T. has also seed of his three other superb Cucumbers at the following prices:

| | |
|---|---|
| Victory of Bath, per packet | 2*s.* 0*d.* |
| Gordon's White Spine, ditto | 1 6 |
| Lord Keynon's Favourite, ditto | 2 6 |

(This last is the best for winter cultivation.

Any quantity of the above will be sent postage free to any part on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church-yard, Bath.

GARDEN AND FARM SEEDS.

W. DRUMMOND AND SONS, SEEDSMAN, Stirling, Scotland, beg to announce, that they are now prepared to execute orders for the above from a large and carefully-selected Stock.

Their Catalogue of Vegetable and Flower Seeds may be had free, by post, on application. It will be found to contain only the names of such varieties as are really worth cultivating; and, from an accurate description being affixed to each, the Gardener and Amateur can have no difficulty in making a suitable selection. In reference to this Catalogue, the Editor of the *Gardeners' Chronicle* says—"It is simple, short, and one of the best we have seen. They are pursuing the sensible course we have so often insisted upon, for the sake of both seller and buyer."

Priced Lists of Farm Seeds are also ready, and may be had on application.

N.B. Parcels of Seeds are in most cases delivered carriage paid.

Agricultural Museum, Stirling, N.B.; and 58, Dawson-street, Dublin.

SPLENDID MULBERRIES.—FINEST PRIZE GOOSEBERRIES.

AS the present is one of the best SEASONS FOR PLANTING, WILLIAM DENNIS and Co., Florists, &c., King's-road, Chelsea, beg respectfully to call the attention of the public to the fact, that the whole of their really useful and Ornamental Stock must absolutely be cleared off this season; and in order to dispose of it as expeditiously as possible, they have called a SALE BY AUCTION, which takes place Feb. 25.; and as it is their intention not to place the slightest reserve on any portion of the Stock, they consider for Gentlemen engaged in Planting, it is an unusually good opportunity. The Stock consists of some extra fine large Fruiting Trees of the Black Mulberry. Pine Plants established in pots, and fine dwarf plants for training. A considerable quantity of Standards of the best sorts of Prize Gooseberries, and above 300 kinds of good bushy Plants, two to five years old; also a large quantity of Evergreens, Deciduous Shrubs, Ornamental Trees, &c. Stove and Greenhouse Plants, comprising fine specimens of Orchidæ, Cacti, fine standard and dwarf bushy Geraniums, Greenhouse and hardy Bulbs, &c. Catalogues may be had on the premises and of the principal Seedsmen, or sent by inclosing two postage stamps.

WOKING NURSERY, SURREY.

GEORGE JACKMAN has to offer from his extensive Stock of CONIFERS, EVERGREEN, and FLOWERING SHRUBS, the following, which are all kept safe for removal. Prices will be furnished on application, or priced Catalogue, by enclosing two postage stamps.

N.B.—Reference required from unknown Correspondents.

Arbor-vitæ American, 3 to 4 ft.; Ditto, close Siberian, 2 to 4 ft.; Aucuba japonica, 1½ to 2 ft.; Berberis aquifolium, 1 ft.; Ditto, dulcis, 1 to 2 ft.; Bays, Sweet, 1 to 2 ft.; Box-tree, variegated, 1½ to 2 ft.; Chimonanthus fragrans, in pots; Clematis, in sorts; Cedar, red, 2 to 3 ft.; Cryptomeria japonica, 2½ ft., in pots, from seeds; Ditto, nana; Hollies, green and variegated, 1 to 3 ft.; Ilex latifolia; Ditto, latispina; Ditto, dypirenna; Juniperus Bedfordiana, 1 ft.; Ditto, Chinese, 2 to 6 ft.; Ditto, macrocarpa; Laurustinus, 1 to 2 ft.; Laurels, common, 1 to 3 ft.; Ditto, Portugal, 1 to 3 ft.; Ditto, Portugal, quartered, fine, 3½ to 4 ft.; Magnolia, Exmouth; Ditto, soulangiana; Privets, evergreen, 1½ to 2 ft.; Ditto, Chinese; Pinus excelsa, 3 to 5 ft.; Ditto, insignis, 2 ft.; Ditto, Cembra, 1 to 2 ft.; Cedrus Deodara, 2 to 4 ft.; Ditto ditto, very fine, 5 to 6 ft.; Ditto, Lebanon, 2 to 3 ft.; Abies Douglasii, from seed, in pots, 2 ft.; Ditto, Smithiana, 2 to 3 ft.; Phillyrea, Ilex leaf, 1 to 2 ft.; Taxodium sempervirens, 1 to 3 ft.; Taxus adpressa; Ditto, elegantissima; Dovaston, 3½ ft.; Tulip-tree, 2 to 4 ft.; Yews, common, 1 to 2 ft.; Ditto, Irish, 1 to 5 ft.; Limes, 6 to 10 ft.—Woking, Feb. 22, 1851.

TO GENTLEMEN ENGAGED IN PLANTING.

GEORGE JACKMAN has to offer a large and well-grown Stock of the following at very low prices, which can be had on application.—Beech, 4 to 5 ft.; Chestnut, Spanish, 2 to 3 ft.; Ditto ditto, 3 to 4 ft.; Elms, English, 4 to 5 ft.; Fir, Larch, 2 to 3 ft.; Ditto ditto, 3 to 4 ft.; Ditto, Spruce, 2 to 3 ft.; Ditto ditto, quartered, 4 to 7 ft.; Ditto, Silver, 1 to 3 ft.; Hazel, 2 to 3 ft.; Ditto, 4 to 5 ft.; Hornbeam, 4 to 5 ft.; Oaks, English, 4 to 5 ft.; Ditto, Scarlet, 2 to 3 ft.; Quicks, strong bedded.

Woking Nursery, Feb. 22, 1851.

ROSES.

ADAM PAUL AND SON beg to inform their friends and the public in general that they have still a good stock of most of the leading kinds of ROSES, which, when the selection is left to them, they offer on the following advantageous terms:

| | | |
|---|---|---|
| Standard Roses, in 12 superior vars., | 18*s.* to 24*s.* per doz. | |
| Dwarf Standard do. | do. | 12*s.* to 18*s.* ,, |
| Climbing Roses | do. | 9*s.* to 12*s.* ,, |

A priced descriptive Catalogue forwarded on receipt of one postage stamp.

All packages delivered free of carriage to London.

Nurseries, Cheshunt, Herts, Feb. 22.

SUPERB RANUNCULI.—The present being the usual month for planting the Ranunculus, we beg to recommend the following selections.

*The new varieties have been selected with great care, of first-rate sorts, from immense quantities of seedlings, and for vigorous growth and free flowering are far preferable to the older varieties. Selections, in strong roots, at the following reasonable charges, with printed instructions for planting and treatment.*

| RANUNCULUS.—*Free by post.* | £ | *s.* | *d.* |
|---|---|---|---|
| 50 Splendid new varieties, with names | 2 | 0 | 0 |
| 25 do. do. do. | 1 | 2 | 6 |
| 100 do. varieties from new and other best named sorts | 3 | 10 | 0 |
| 50 fine named varieties | 0 | 15 | 0 |
| 100 finest mixed | 0 | 10 | 0 |
| 100 fine do. 5*s.*, or free by post, 6*s.* | | | |

| Gandavensis, 5*s.* p. doz. | 0 6 | | |

Copies of our Autumn Root Catalogue may still be had. Remittances required from unknown correspondents.

BASS AND BROWN,
Seed and Horticultural Establishment, Sudbury, Suffolk.

MITCHELL'S MATCHLESS WINTER PARSLEY, Extra Superior for Garnishing.—J. M. having a quantity of new Seed to dispose of, can highly recommend it to Market and Gentlemen's Gardeners as the hardiest and best winter sort ever produced. Retail price, 2*s.* 6*d.* per lb. Also, his superior dark-green Savoy, 1*s.* 6*d.* per lb. A liberal allowance made to Seedsmen.—Post-Office Orders made payable to JOHN MITCHELL, Pounder's End, Enfield, Middlesex.

DOUBLE ITALIAN TUBEROSE ROOTS, 3*s.* PER DOZEN.

ROBERT HALL, 63, South Audley-street, Grosvenor-square, facing the chapel. Postage Stamps taken in payment.

R. H. begs to remark that his TUBEROSE ROOTS have been left in the ground a sufficient time to mature, instead of, as is too generally the case, being hurried out to secure an early market when only about one-half of them will bloom. Also small Yorkshire Breakfast Hams, 10*d* per pound.

NEW EARLY POTATOES (Carriage free).—

| | Per bush. | Per peck. |
|---|---|---|
| JACKSON'S GOLDEN DROP (direct from Messrs. Jackson) | 5*s.* 6*d.* | 1*s.* 6*d.* |
| JACKSON'S IMPROVED KIDNEY | 7 6 | 2 0 |
| SUTTON'S RED ASH-LEAF KIDNEY | 7 6 | 2 0 |

The above are three of the best Potatoes in cultivation, being exceedingly early, prolific, mealy, and good for keeping.

Post-office orders are requested in payment, addressed JOHN SUTTON and SONS, Seed Growers, Reading, Berks.

Also the Reading Giant Asparagus Plants, very strong, 3*s.* 6*d.* per 100.

MESSRS. HAY, SANGSTER, AND CO. will be ready to supply their prepared POTATO CUTTINGS about the middle of April next, the produce of which proved so highly satisfactory last, as well as the experimental trials of the three former years, as to QUALITY, QUANTITY, and SIZE, being more than double the crop this year of those planted in the usual way, and containing a much larger quantity of starch, which is so essentially necessary to the preservation of that valuable root. A report of the analysis will be found below. Our own experiments give about one-third more saccharine matter than the best we could procure grown under the old system. All orders must be to hand on or before the end of the second week in April, as H. S. and Co. are preparing to plant a large breadth, and will only provide for what may be ordered up to that time. Post-office orders to be made payable to JOHN SANGSTER, at the Borough Post-office, Southwark. Printed instructions for planting and management will be sent with the plants ordered.

| Per 1000—*s. d.* | | Per 1000—*s. d.* | |
|---|---|---|---|

| Soden's Early Oxford | 15 0 | Do. Radical | 10 6 |
| Early Cockney | 15 0 | Fox's Seedling | 10 6 |

Package and delivering to any Carriers' Office in London, 1000 to 5000, 1*s.*—Newington Butts, London, Feb. 22.

*** We have examined a sample of Potatoes, called York Regents, grown by Messrs. HAY, SANGSTER, and Co., in comparison with two other samples of Potatoes of the same denomination, obtained by ourselves from a highly respectable Potato Salesman, with a view to ascertain the amount of starch contained in each, with the following results—viz.,

| | Starch. |
|---|---|
| Messrs. HAY, SANGSTER, and Co.'s York Regents | 15½ per cent. |
| Salesman, No. 1 | 11½ ,, |
| ,, No. 2 | 9½ ,, |

MAURICE SCANLAN, F.C.S., Chemical Works, George-street, Bermondsey; ALFRED ANDERSON, F.C.S., Experimental Chemist, Great Suffolk-street, Southwark.

SAMUEL FINNEY AND CO.'S CATALOGUE OF SEEDS, for 1851, is now ready, and may be had postage free, on application. It contains a Select List of all the most approved sorts of Culinary Vegetables in cultivation. Also an extensive collection of Flower Seeds, including the imported German kinds, with descriptions, stating the proper time for sowing, hardiness, duration, height, time of flowering, and the colour of each, with much other useful information. The collections of Seeds sent out last year by S. F. and Co. having given general satisfaction, they again offer them as under.

CAMELLIA STOCKS FIT FOR IMMEDIATE WORK.

RENE LANGELIER, Clarendon Nursery, St. Helier, Jersey, begs to inform the Public that he has a very extensive stock of the above, fit for immediate grafting, very clean and healthy, well rooted, so as to leave without the pot, consequently much less expense in conveying to any distant place. Price 36*s.*, 40*s.*, and 50*s.* per 100.

The Stock is such as has never before been offered to the Public by any grower.

R. L. has a most extensive collection of Double Camellias at a very moderate rate and reduced price, as will be seen by a Catalogue recently published, in which it is proved that they can stand the climate out-of-doors without protection. The Catalogue can be had of R. L. by inclosing four penny stamps. Remittance or reference from unknown correspondents.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Feb. 22.

MITCHELL'S ROYAL ALBERT RHUBARB has proved itself to be the earliest, finest flavoured, and most productive kind, as well as the best for early forcing, ever yet grown. Strong roots, 12*s.* per dozen. Also Myatt's Linnæus, 12*s.* per dozen; and Victoria, 9*s.* per dozen; with usual allowance to the trade. Post-office orders are requested to be made payable to WILLIAM MITCHELL, Enfield Highway, Post-office, Enfield, Middlesex.

NEW KITCHEN GARDEN SEEDS.—Warranted Excellent quality. Carriage Free! (See below).

**** All Seed Orders above 2*l.* delivered Free of Carriage to any Station on the Great Western, Bristol and Exeter, or South Devon Railways; or to Cork, Dublin, or Belfast, by steamers.

Apply to WILLIAM E. RENDLE & Co.,
Seed Merchants Plymouth.

N.B.—All the New Vegetable and Flower Seeds advertised from time to time in this Paper can be obtained from us, at the regular current prices.

HEATHS AND OTHER PLANTS FOR EXHIBITION.

WILLIAM JAMES EPPS begs to state that he has for sale the finest Stock of Young HEATHS and other Greenhouse and Stove Plants possible, which will make splendid specimens in a short time. The superior character of Plants sent out from this Establishment is justly admitted by all who have purchased. The magnificent specimens of Heaths, &c., exhibited by him last season at the Exhibitions at Chiswick and the Royal Botanic Gardens, London, where he received the highest awards, fully justify the foregoing remarks.

Strong bushy Plants can be had at the following low prices, exclusive of packing, carriage paid to London:

| | £ | *s.* | *d.* | | £ | *s.* | *d.* |
|---|---|---|---|---|---|---|---|
| 100 fine varieties of Heaths ... ... | 5 | 0 | 0 | 100 fine vars. of Stove and Greenhouse Plants ... ... | 5 | 0 | 0 |

| 25 ditto ditto | 2 | 2 | 0 | 25 ditto ditto | 2 | 2 | 0 |

All the new leading kinds of Geraniums and Cinerarias 12*s.* to 21*s.* per doz.

Catalogues of the above may be had on application.

Bower Nurseries, Maidstone.—Feb. 22.

CLEMATIS TUBULOSA, FROM MONGOLIA.

HUGH LOW AND Co. having a considerable stock of the above-named beautiful free flowering, hardy, suffruticose plant, producing splendid masses of purple flowers during the autumn months, offer strong plants at 1*s.* 6*d.* each, or 12*s.* per dozen.

They also have for sale very fine, healthy bushy plants of CITRUS JAPONICUS, or as it is commonly called, OTAHEITE ORANGE. Wherever this plant is known, it is universally admired, on account of the facility with which it can be made to produce fruit in abundance in a very small state. Price 42*s.* per dozen.—Clapton Nursery, London.

LIBOCEDRUS CHILIENSIS, Endlicher (THUJA CHILIENSIS, Don).—A noble Evergreen Conifer, a native of the Andes of Chili and the southern provinces of Antucco and Valdivia, growing to the height of 65 to 80 feet. Sir Wm. Hooker says—

"*It is a tree of great beauty, and well worthy of being introduced into our gardens. There can be little doubt, from its native regions (inhabiting the same elevations on the mountains as the Araucaria imbricata), that it will thrive well in the open ground.*"

The following is an extract from a letter lately received from the well known botanical collector Mr. Bridges:—"In one of the late numbers of the *Gardeners' Chronicle* I see some doubts expressed relative to the Thuja Chiliensis being hardy in England. It will, in my opinion, be perfectly so, judging from what I have seen of the plant in the province of Colchagua, south lat. 35°, which is its most northern limit. It is found near the snow, and where it freezes, I should say, quite as severely as it does in the vicinity of London. Where the tree grows alone it is very graceful, the lower boughs are even on the ground, and it elevates itself to a great height. The timber is esteemed by the natives for building purposes. I have myself seen it as far south as 42°, and I learn it is found in the vicinity of Cape Horn."

Fine healthy well-established one-year-old plants, from seed, in single pots, 7*s.* 6*d.* each, three for 21*s.*, or 4*l.* per dozen.

HUGH Low and Co., Clapton Nursery, London.

GERMAN FLOWER SEEDS.—Our Selections of the above showy Ornaments of the Flower Garden having for several years given general satisfaction, we hereby announce the arrival of our annual supply, selected by us in Erfurt from those personally known to us as the most select and careful growers. It includes the most distinct varieties of Stocks, Asters, Balsams, Larkspurs, Zinnias, Wallflowers, and Hollyhocks. They will be made up in 5*s*, 10*s.*, 20*s.*, and 40*s.* packets, and each packet will contain part of the whole collection, if not otherwise ordered by the purchaser.

We have also a carefully selected assortment of all the leading and most approved varieties of Vegetable and Flower Seeds, which we offer at the current prices.

A Catalogue of General Nursery Stock stamped, free by post, may be had on application.

HUGH Low and Co., Clapton Nursery, London.

AMERICAN PLANTS.

C. LODDIGES AND SONS, in consequence of part of their Nursery being given up for building purposes, are enabled to offer the following at extraordinarily low prices for cash:—Finest Ghent Azaleas, named, very handsome bushy plants, well set with flowers, and peculiarly adapted for forcing, 18*s.* per dozen; Azalea pontica, 8 feet in circumference, 12*s.* per doz.; Andromeda floribunda ditto, 7*s.* 6*d.* to 10*s.* 6*d.* each; Vaccinium, 30 species, 63*s.*; Andromeda, do., 63*s.*; Rhododendron campanulatum, very fine, 10*s.* 6*d.* each.—Post-office orders made payable at Hackney.

GREAT SALE OF NURSERY PLANTS.

PETER BOOTH, NURSERYMAN, Falkirk, is Selling off, at his very extensive grounds, a very large stock of Transplanted LARCH, SCOTCH, and SPRUCE FIR PLANTS, of strong and smaller sizes, including Seedlings, with a great variety of all the other kinds of Forest Trees, Shrubs, &c., generally grown in large Nurseries, of most excellent quality, and at prices much reduced.

NEW LAPSTONE KIDNEY POTATO.—This Potato is of first-rate quality, and has been highly spoken of by Dr. Lindley in the *Gardeners' Chronicle*, and also by every one that has grown it. It is a most abundant bearer, and the best in quality of any Potato grown, and keeps good up to May or June. They are of good size, and have been grown on warp land near the banks of the Trent, and therefore will be a good change for any other soil.

New Lapstone Kidney Potatoes, in sacks of 2 cwt., at 16*s.*, sacks included.
Prince Regent, ditto, ditto, 10*s.*
Early Shaws, ditto, ditto, 9*s.*

Early orders accompanied by remittances will receive prompt attention.

WILLIAM STENT, Nursery and Seedsman, Stockwith, Gainsborough, Lincolnshire.

BEAUTIFUL, USEFUL, AND CHEAP!
WARRANTED TO PLEASE.

The following COLLECTIONS of SEEDS and PLANTS are deserving especial notice, and are important to all who have a Garden.

No. 1.—100 varieties of HERBACEOUS PLANT SEEDS, hardy PERENNIALS, comprising the most select and beautiful sorts from our unrivalled Collection—never before offered—purchaser's selection, free by post, 1*l.* 5*s.*

No. 2.—50 varieties fine do., purchaser's selection, 15*s.*

No. 3.—25 do. do., 8*s.*

A list containing height, colour, and time of flowering, with much other useful information relative to their culture, may be had on application.

ANNUAL FLOWER SEEDS—post free.

No. 4.—100 vars. purchaser's selection, from list containing the newest and showiest sorts of hardy, half-hardy, and tender Annuals, 18*s.*

No. 5.—50 vars., purchaser's selection, 10*s.*

No. 6.—25 do. do., 8*s.*

Or we shall be happy to make selections for purchasers of the quantities at the above prices. The Annuals will be contained in Ayres and Moore's descriptive cultural labels.

The following are WARRANTED GENUINE, and are very superior:

HOLLYHOCK, from a most superb Collection of named double flowers, per packet, 1*s.*

CINERARIA, from the newest and best show flowers of 1850 per packet, 1*s.* 6*d.*

CALCEOLARIA, do. do., splendid, per packet, 2*s.* 6*d.*

PANSY, do. do. do., per packet, 1*s.*

PETUNIA, do. do. do., per packet, 1*s.*

N.B.—The above five unique lots may be had separate, or if required will be included in Collection No. 1. They have all been collected from our own plants and purchasers may rely with confidence on their quality.

GREENHOUSE PLANTS.

ERICAS, 50 fine healthy plants, most of them large enough to bloom the coming season, and all ready for growing into specimens. Purchaser's selection from list, in 50 superb varieties, for 3*l.* 10*s.*; or per doz., 21*s.*

ERICAS, 50 finest vars. as above; large plants, own selection, for 2*l.* 10*s.*; or 15*s.* per doz. In the above Collections will be found all the leading sorts of the day, selected with the greatest care for beauty and display.

MISCELLANEOUS GREENHOUSE AND STOVE PLANTS.

50 superior varieties, purchaser's selection, comprising the handsomest species and varieties of all the leading kinds, for 3*l.* 10*s.*, or 21*s.* per dozen.

50 varieties as above, own selection, 2*l.* 10*s.*, or 15*s.* per doz.

CHINESE AZALEAS.—20 fine varieties, purchaser's selection, for 25*s.*, or 18*s.* per doz.

20 do. do., own selection, for 21*s.*, or 15*s.* per doz.

ROSES.—50 splendid sorts Standards, own selection, per 100, 5*l.*; or 18*s.* per doz.

100 fine varieties, Dwarfs, in 100 sorts, 2*l.* 10*s.*; or 9*s.* per oz., own selection.

CALCEOLARIAS.—Fine healthy, established Plants from the most eminent growers, per doz., 3*os.*, own select on, of best sorts. When the selection is left to ourselves purchasers are desired to furnish lists of such plants, seeds, &c., as are already in their collections, that duplicates of any article may not be sent, every wish will be strictly complied with.

HOLLYHOCKS, No. 1, fine double named kinds, all shades of colour, 9*s.* per doz., or 2*l.* 10*s.* per 100. HOLLYHOCKS, No. 2, for border display, very good, 6*s.* per doz., or 1*l.* 10*s.* per 100. These are selected out of some hundreds of seedlings, and may be confidently relied on.

HERBACEOUS PLANTS.—Purchaser's selection, from List, per 100, 3*l.* 3*s.*

W. MAY's selection, extra fine, No. 1, 2*l.* 2*s.* per 100;
" " really good, No. 2, 1*l.* 10*s.* "

Having an immense stock they can be furnished at these low prices. The collection extends over 700 species and varieties selected from the choicest stocks in the country (regardless of expense) for display, and warranted second to none. To meet our customers in every way, we hope to be favoured with lists of such plants as are already in their collections, that duplicates of any articles may not be sent where the selections are left to ourselves.

FLOWERING SHRUBS AND ORNAMENTAL TREES.—The finest varieties, purchaser's selection, from the list, per 100, 3*l.* 3*s.*

W. MAY's selection, No. 1, extra fine, per 100, 2*l.* 2*s.*
" " No. 2, good kinds, " 1*l.* 5*s.*

This Nursery has long held high celebrity for possessing a most splendid stock of flowering shrubs, extending over upwards of 600 species and varieties of the choicest kinds. Some hundreds were selected by Mr. E. KEMP, for the Park at Birkenhead; and for correctness of naming, quality, and health, not excelled by any.

To gentlemen forming Arboretums, or making extensive Ornamental Shrubberies, this is an opportunity seldom offered.

COMMON LAURELS, 1½ to 2 feet, per 1000, 4*l.*; or per 100, 10*s.*, fine healthy stuff; 2 to 3 feet, bushy, extra fine, per 1000, 5*l.*—per 100, 15*s.*

GOOSEBERRIES, all the finest Lancashire show sorts, per 1000, 4*l.*, in 100 varieties, or 10*s.* per 100 in 50 varieties; the stock extends over 30,000; and is very fine and healthy.

CURRANTS.—White, Red, and Black, including Black Naples, per 100, 10*s.*, fine.

Catalogues may be obtained on application, and the fullest information will be given. Apply to JOHN MAY, to whom all Post-office orders must be made payable. Orders above 5*l.* carriage paid to London, or within 150 miles of the Nurseries. Address WILLIAM MAY, Hope Nurseries, Leeming-lane, Bedale, Yorkshire.

PILTDOWN NURSERIES, MARESFIELD, SUSSEX.

JAMES MITCHELL begs to announce that he purposes sending out in May, in strong plants, his superb new Dahlias, also all the leading varieties of other growers.

MITCHELL'S QUEEN OF BEAUTIES.—This novel and extraordinary flower has one of the most rich and beautiful rose tips ever seen on a pure enamel white ground, two-thirds of a globe with an outline smooth and round; very double, very symmetrical, the eye level with the surface, and has been admired by everybody who has seen it. It obtained a first-class certificate at the Royal South London Show, the Grand Annual Trial Show, at the Grecian Saloon, also at all the principal shows in Sussex and Kent—4 feet, 15*s.* per plant.

MITCHELL'S ELEGANTISSIMA.—This is also an extraordinary novelty, a fancy variety, marked with tortoiseshell, and perfectly unlike everything that has been seen before. This also had a certificate at the great Trial Show, on the round of its novelty—4 feet, 10*s* 6*d.* per plant

UNRIVALLED GERMAN ASTERS,
TWENTY-FOUR VARIETIES MIXED.

These superb Globe Asters have never been placed on an Exhibition table without the first prize being awarded to them. The under-mentioned may be considered sufficient to justify their being offered to the public. At the Bath Royal Horticultural Society 10 first prizes were awarded to them. At the Chepstow Horticultural Society, six first prizes; at the Devizes Horticultural Society, six prizes. By enclosing 12 penny postage stamps to J. REID, Nurseryman and Seedsman, Richmond-street, Weston-super-Mare, a packet of seed will be sent in return.

LILIUM LANCIFOLIUM, RANUNCULUSES, ANEMONES, AURICULAS, AND PELARGONIUMS.

HENRY GROOM, Clapham Rise, near LONDON, by appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to recommend to the attention of the Nobility, Gentry, and Amateurs, his extensive assortment of the above FLOWERS. He begs to say that this is a good season of the year to make a selection of the various kinds. Ranunculuses and Anemones should be planted this month.

C. " Fruit Trees.
D. " Hardy Herbaceous Plants.
E. " Forest Trees.
F. " Greenhouse Plants, &c.
G. " Agricultural, Garden, and Flower seeds.

N.B.—The prices are attached to every article. All packages delivered free of carriage to London.

ADAM PAUL and SON, Nurseries, Cheshunt, Herts.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK invites attention to the fact that there is a regular and steady demand for SLATE TUBS for Orange Trees, Camellias, and Ornamental Plants, their superiority over all others being proved by this fact, and their extensive use in the Royal Gardens, Kew.

E. B. will be glad to forward a printed description in answer to all applications.

All articles in Slate manufactured by E. B. may be seen extensively in use at Worton Cottage, on application to the gardener, Sundays excepted.

MELONS! MELONS! MELONS!
The finest flavoured in the world is the BROMHAM HALL, Green Flesh.

EDWARD TILEY respectfully informs the Nobility, Gentry, and Melon Growers in general that he has still a stock of good old Seed of this splendid Melon saved in 1848, and which has given universal satisfaction to all purchasers of last season. To prove its superiority of flavour over all other Melons, the following opinion has been given. It was forwarded to the Editor of the *Gardeners' Chronicle*, July 22, 1848, for his judgment, and he was of opinion that the Bromham Hall Melon was the finest flavoured he had ever tasted. It was exhibited at the Chiswick Exhibition, July 11, 1849, where it was awarded by the judges the Silver Knightian Medal for its luxuriant flavour. Again it was forwarded to Dr. Lindley, August 11, 1849:—"We have received your Bromham Hall Melon; it was much over-ripe, nevertheless it was by far the best flavoured Melon we ever tasted." It was exhibited at the Horticultural Society's Rooms, Regent-street, September 4, 1849, and pronounced by the judges to be the best flavoured Melon they ever tasted, and was awarded the Banksian Medal. On the 20th July, 1850, again exhibited at Chiswick, and obtained first and second prizes for its superior flavour. It was grown last season at the Horticultural Society's Gardens, London, by Mr. Thompson, superintendent to the fruit department, whose opinion was in accordance with the others. The fruit is very handsome, round shaped, hollow crown, beautifully netted, thin skin, and flesh very firm; a free setter and abundant bearer, weight from 3 to 4½ lbs. It may be as easily grown by an amateur in a frame as the common Vegetable Marrow; also retains its fine flavour for a considerable time after being cut. Sold in packets at the reduced price of 1*s.* 6*d.*; also the following other fine varieties can be highly recommended, all true old Seed:—

| | 1*s.* 0*d.* per packet |

Any quantity of the above will be sent postage free to any part, but a remittance must accompany the order from unknown correspondents either by Post-office order or penny postage stamps.—Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath.

THE BLACK AUSTRIAN PINE.—"PINUS AUSTRIACA." LUCOMBE, PINCE, AND Co. have a large and healthy stock of this most desirable Pine, exceeding 300,000, from 9 inches to 3 feet high, which having been frequently transplanted, are well rooted and safe to remove; they can offer them, varying according to age and quality, from 20*s.*, 40*s.*, to 60*s* per 1000. This Pine has been proved to thrive in bleak and exposed places, and in the poorest soils; growing rapidly and producing dense shelter in places where other trees will not grow; it also thrives well close to the sea, resisting the spray and roughest winds.

Exeter Nursery, Feb. 22.

OUR DESCRIPTIVE CATALOGUE OF FARM SEEDS *is just published, and can be had in exchange for One Penny Stamp. It contains a description of all the best varieties of Turnips, Carrots, Mangold Wurzel, with prices affixed to every article. The list of Grasses is peculiarly comprehensive, and contains short descriptions of all the leading kinds. There is also some useful advice relative to the sowing of Grass Seeds for permanent pasture, concerning which* Mr. KEMP, *of Birkenhead Park, in a letter to us says:—"I am glad that you repudiate the practice of sowing Corn with Grass Seeds, a custom I have often had to combat."*

All Orders above 2*l.* Carriage Free. (See Catalogue.)

Apply to WILLIAM E. RENDLE and Co., Seed Merchants, Plymouth.

SEED AND HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

BASS AND BROWN'S SEED and PLANT LIST for 1851 is now complete, and stamped as a newspaper, to go free by post. It is prefaced with a page of Instructions for SOWING and RAISING SEEDS, with allusions to Sorts requiring peculiar treatment, and contains the following:

PART I.—FLOWER SEEDS, consisting of lists of 422 new and most showy sorts, with colour, height, hardiness, duration of each, price per packet, and other useful information.

PART II.—VEGETABLE SEEDS, with time of sowing each kind, prices of each, and other descriptive information.

PART III.—AGRICULTURAL SEEDS, containing also much useful information.

PART IV.—ROOTS, FRUITS, BULBS, &c. for early planting.

PART V.—Contains our Descriptive Priced Catalogue Lists of Show, Fancy, Scarlet, and other Geraniums; Fuchsias, Dahlias, Petunias, Verbenas, Chrysanthemums, Cinerarias, Achimenes, Gloxinias, Azalea indica; Greenhouse, Stove, and Miscellaneous Select Plants.

PART VI.—Contains NEW PLANTS of 1851.

The following Collection will be highly approved:

| VEGETABLE SEEDS. | £ | *s.* | *d.* |
|---|---|---|---|
| A collection in full proportion, one year's supply, for a large garden, of first-rate sorts, including 24 quarts of Peas, 6 quarts Broad Beans, 10 sorts Broccoli, 6 of Cabbage, 3 of Cauliflower, 8 of Lettuce, 5 of Onion, 5 of Radish, and all other sorts in proportion | 3 | 0 | 0 |
| The same collection, in smaller quantities ... ... ... | 2 | 0 | 0 |
| Collection, in reduced proportion ... ... ... | 1 | 0 | 0 |

NURSERY GROUNDS, RED LODGE, NORTH STONEHAM, NEAR SOUTHAMPTON.—An unlimited supply of every description of FOREST, FRUIT, AND ORNAMENTAL TREES, AMERICAN PLANTS, AND FLOWERING SHRUBS, may be procured from these extensive grounds, at the most reasonable prices, printed Catalogues of which may be had of the proprietor, WM. ROGERS, Sen., NURSERYMAN AND CONTRACTING PLANTER.

Transplanted Forest Trees, 1 to 2 feet, adapted for extensive Forest or Coppice Planting, usually sold by the thousand; and also of a large size, for Ornamental Planting, or immediate effect, from 3 to 12 feet, 25*s.* to 5*l.* per 100.

Ash, Beech, Birch, 15*s.* to 30*s.* per 1000; Spanish Chestnut, 20*s.*, 30*s.*, and 40*s.*; Larch Fir, 7*s.* 6*d.* to 20*s.*; Spruce, 20*s.*, 30*s.*, and 40*s.*; Scotch, 10*s.*, 15*s.*, 20*s.*: Pinaster, 10*s.*, 15*s.*, and 20*s.*; Sea Pine, adapted for exposure to the sea, 15*s.*, 25*s.*, and 40*s.*; Mahonia, for cover, 40*s.* to 80*s.*; Hazel, 15*s.*, 20*s.*, and 35*s.*; English Oak, 15*s.*, 20*s.*, and 40*s.*; Poplar, 20*s.*, 30*s.*, and 40*s.*; Quicks, 5*s.*, 7*s.* 6*d.*, and 10*s.*

Planting contracted for to any extent, from 5*l.* to 20*l.* per acre.

ORNAMENTAL TREES AND SHRUBS.

Rhododendron ponticum, 2 to 6 inches, 20*s.*, 40*s.*, and 80*s.* per 1000; 1 foot, single stems, fit for working, 10*s.* per 100; 1½ to 2 feet, strong, 20*s.* to 40*s.* per 100, fit for planting out at once for cover; 4 to 6 feet, single stems, for working the beautiful scarlet and other fine kinds, 50*s.* per 100. Tree Rhododendrons may thus become as generally cultivated as Tree Roses. Scarlet Rhododendrons, 18*s.* per dozen; hybrid scarlet, lilac, and white, with large handsome trusses of flowers, 4 to 6 inches, 25*s.*; 1 foot, 40*s.* per 100; Kalmia latifolia, 2 to 4 inches, 8*s.* to 12*s.* 6*d.* per 100; 1 to 2 feet, blooming buds, 50*s.* per 100; 2 to 3 feet, fine, 75*s.* per 100; Epigæa repens, 50*s.* per 100; and all other American plants at equally low prices.

Dwarf Rose Stocks for working, 8*s.* per 100; Single Camellias, 25*s.*, 40*s.*, and 50*s.* per 100, fit for working; Double Camellias, of sorts, on own roots, 6 to 9 inches, 12*s.* per dozen; Pinus (Abies) Douglasi, from seed, 18 inches to 2 feet, 60*s.* per dozen; Arbutus, 12 inches, 8*s.* per 100; 1½ foot, 20*s.* per 100; 2 feet, 30*s.* per 100; Laurel, 8*s.* to 20*s.* per 100; Laurustinus, bedded, 40*s.* per 1000, 8*s.* per 100; Variegated Holly, 1 foot, 25*s.* per 100; Clematis azurea grandiflora, 6*s.* per dozen, 42*s.* per 100; D utzia scabra, 2 feet, 12*s.* per 100; Common China Rose, 12*s.* 6*d* per 100; Tree Roses of the most select kinds, 5*l.* per 100; Dwarf Roses, 50 sorts, named, 50*s.* per 100; Double White, Double Red, and New Crimson Thorns, 40*s.* per 100, 6*s.* per dozen; Large Dutch Honeysuckles, 12*s.* 6*d.* per 100; Giant Irish Ivy, 8*s.* per 100; 2 years seedlings, Scotch Fir, fine, 2*s.* 6*d.* per 1000; 1 years seedling Larch, 2*s.* 6*d.* per 1000; 2 years seedling Horse Chestnut, 12*s.* 6*d.* per 1000.

The prices are for wholesale; if ordered in less quantities a higher price will be charged. All orders above 5*l.*, carriage paid to London.

American purchasers will find great advantages in procuring their supplies from these grounds, from their proximity to the Docks whence the American steam-packets take their departure, thus saving the delay and expenses of land carriage.

SUTTON'S SUPERB LETTUCES, POST FREE.

J. SUTTON and SONS *had the honour of supplying the Horticultural Society's Garden at Chiswick, with the above-named Lettuce Seed, in Feb.* 1849; *and in March,* 1850, *the Editor of the* GARDENERS' CHRONICLE, *in a critique on Lettuces, says of the first of these:—*

SUTTON'S "SUPERB WHITE" LETTUCE.

"This is the very best Cos Lettuce, very large, light green, leaves hooded at the top, so that they close in without tying, blanching white, crisp, so excellent that one would suppose no higher degree of perfection could be attained, as regards a summer Lettuce." *And of the other two, he further says,* "SUTTON'S SUPERB GREEN COS: this very much resembles the preceding, but is of a darker green, and hardier, therefore is preferable for sowing early in spring, and also for autumn use; in warm, sheltered situations, it will stand the winter, if the latter prove mild. For the generality of winters, however, a hardier Cos is required; such is the following—SUTTON'S BERKSHIRE BROWN COS: this is the best Cos for standing the winter; it is large, and of good quality, blanching very crisp; therefore its brown outside should not be considered objectionable."

These superior Lettuces may be had in good sized packets of Seed, sufficient to raise several thousand plants, at 1*s.* (or 12 postage stamps) for each sort.

*Address*—JOHN SUTTON and SONS, *Seed Growers, Reading, Berks.*

Also Sutton's Solid White Celery, and Sutton's Imperial Cabbage, 1*s.* per packet, decidedly the best sorts in cultivation. Conqueror of the West Cucumber, 1*s.* per packet; Orache, 6*d.*, same sort as described by the Editor of the *Gard. Chronicle.*

ESTABLISHED 1786.

WILLIAM E. RENDLE AND CO., SEED MERCHANTS by special appointment to the SOUTH DEVON AGRICULTURAL ASSOCIATION, and several influential Members of the Royal Agricultural Society, Union Road, Plymouth.

We have this season a choice and well assorted Stock of all the best FARM SEEDS. They have been grown and selected with the greatest care, and can be highly recommended as being of the most genuine quality. Our sale of Turnip Seeds alone last season exceeded 1000 bushels; our extensive dealings therefore enable us to sell at the lowest remunerating prices, and at the same time is the strongest evidence we can offer of the large and increasing patronage bestowed upon us, for which we have to return our most grateful acknowledgments.

COMPOSITION for HEATHS, NEW HOLLAND, and all other STOVE and GREENHOUSE PLANTS, may be obtained of superior quality, by applying to W. COOPER, Florist (late with Mr. Pawley), Bromley, Kent, at 12*s.* 6*d.* per sack, including sack, and carriage-paid to London.

A remittance is respectfully solicited from unknown correspondents.

MESSRS. J. AND H. BROWN'S NEW CATALOGUE OF PLANTS FOR 1851, free by post, includes Orchidea, Stove and Greenhouse Plants, Roses, Geraniums, Fuchsias, Camellias, Azaleas, Conifers, &c. They also offer the following Choice Plants and Fruit Trees:—

Flower Seeds, 18 papers, 5*s.*; 36 ditto, 10*s.*, of the most approved varieties, sent free by post.

Albion Nursery, Stoke Newington, London, Feb. 22.

SEEDLING LARCHES.

WILLIAM WOOD AND SON having on hand a very extensive stock of the above in fine condition, beg to offer them as under.

One year seedling Larch, at 1*s.* 3*d.*, 1*s.* 6*d.*, and 1*s.* 9*d.* per 1000.
Two year ditto, 3*s.* to 3*s.* 6*d.* per 1000.
One year seedling Alder, 3*s.* 6*d.* per 1000.
One year seedling Ash, 2*s.* 6*d.* per 1000.
Two year ditto, 3*s.* 6*d.* per 1000.
One year seedling Birch, 2*s.* per 1000.

TRANSPLANTED.

Larch, 12 to 15 inches, 7*s.* 6*d.* per 1000.
Scotch Fir, 1 to 2 feet, 12*s.* 6*d.* per 1000.
Birch, 3 to 4 feet, 30*s.* per 1000.
Do., 4 to 5 feet, 35*s.* per 1000.
Thorns at reduced prices.

With every other kind of Forest Trees equally cheap.
Woodlands Nursery, Maresfield, near Uckfield, Sussex.

NEW AND CHOICE FLOWER SEEDS, GERMAN STOCKS, GERMAN ASTERS, &c.

J. C. WHEELER AND SON, NURSERYMEN and SEEDSMEN, by Official Appointment, to the Gloucestershire Agricultural Association, 99, Northgate-street, Gloucester, have selected, out of a large collection of Flower Seeds, 20 of the most beautiful and showy varieties, each sort distinct in colour, and calculated to produce a fine effect when planted out in beds or groups in the flower border. Each variety is distinctly marked with its Botanical and English name, height, time of flowering, colour of the flower, manner of growing, whether erect or trailing, &c., &c., the time it should be sown, and other valuable hints as to its cultivation. In selecting these 20 varieties, care has been taken to exclude all which are shy-bloomers, or have an insignificant appearance; so that the collection will comprise only those which are really showy and handsome, and which, it is believed, would prove to the entire satisfaction of any lady or gentleman who might be disposed to order them. The German Stocks and Asters especially are most superb.—The 20 Packets are neatly packed up in one paper, and will be sent free by post, to any part of the Kingdom, for 5*s.*

HART AND NICKLIN, FLORIST, Guildford, Surrey, possess a fine healthy Stock of the under-named Plants, which they offer to the public, feeling assured they will give satisfaction to purchasers.

FANCY GERANIUMS—Alboni, Jenny Lind, Reine des Francais, Mazeppa, Magnifica, Wintonia, Jehu superb, Anais, Lady Rivers, La Belle de Africaine, Beauty of Winchester, Diadematum coccinia, Madame Celeste, Yoolinski; 21*s.* the Set.

GERANIUMS—Emily, Crusader, Brilliant, Belle of the Village, Rosalind, Princess; 21*s.* the Set.

PANSIES—Helen, Juventa, Premier, Negro, Lucy Neal, Polyphemus, Uttoxeter Hero, Conductor, Pre-eminent, Gem, Viceroy, Criterion, Duke of Norfolk, Mrs. Beck, Masterpiece, Androcles, Heroine, California, Duchess of Norfolk, Ariel; 20*s.* the Set.

No charge for Package, and Carriage paid to London, or any Station on the South-Western or South-Eastern Railways.

"ORACHE," SUPERIOR IN EVERY RESPECT TO SPINACH.—The leading article of the *Gardeners' Chronicle* of January 25, 1851, fully bears out the above assertion, that this is one of the very best summer vegetables, superior to Spinach in its flavour, and possesses the advantage of affording a constant and permanent supply (without going to seed) of large luxuriant leaves throughout the summer months. It was most successfully grown last season at the seat of Joseph Hume, Esq., M.P., Burnley Hall, in this county, and much preferred to Spinach. Sealed packets 2*s.* 6*d.* and 5*s.* each, per post free, containing a sufficient supply for a large or small family.

Also may be had, Seeds of the "True Custard Gourd," a most delicious Vegetable Marrow. Packets containing 6 seeds, 1*s.*, per post free. Payments by postage stamps or Post-office order.—YOUELL and Co., Royal Nursery, Great Yarmouth.

BECK'S SEEDLING PELARGONIUMS AND THE BEST OF OTHER RAISERS' VARIETIES. Fine plants, ready for shifting into large pots; twelve for two guineas, including carriage to London and the packing-case. This is the proper time for purchasers to procure them. Catalogues may be had on application to J. DOBSON, Worton-cottage, Isleworth, Middlesex. The stock was never finer, and purchasers may rely on the best selection being made for them, if they cannot choose for themselves.

# The Gardeners' Chronicle.

*SATURDAY, FEBRUARY* 22, 1851.

MEETINGS FOR THE ENSUING WEEK.

| | | | | |
|---|---|---|---|---|
| MONDAY, | Feb. | 24 | British Architects | 8 P.M. |
| | | | Geographical | 8½ P.M. |
| TUESDAY, | — | 25 | Civil Engineers | 8 P.M. |

IN anticipation of the coming Industrial Exhibition, the Council of the HORTICULTURAL SOCIETY have decided upon some new regulations, which it is now time to make public.

In the first place, each Fellow of the Society may have 48 privileged tickets, instead of 24, as heretofore.

It is also settled that all Fellows shall have an early admission at 12 o'clock, together with one friend; and that the same privilege shall be extended to the wife or sister of a Fellow: he not being able himself to attend. And in order to make this regulation the more valuable, the public will not be admitted till 2 o'clock, instead of 1, as in former years.

At the same time the admission fee payable on the election of a Fellow is reduced from six guineas to two guineas.

Mr. HOSEA WATERER, of Knap-hill, who has withdrawn from the Royal Botanic Society's Exhibitions in the Regent's-park, has also made arrangements for displaying his magnificent American plants in a part of the garden recently prepared for the purpose. Admission to this exhibition will be by tickets, 1*s.* each; but Fellows are personally exempt from that charge.

Finally, it is intended to authorise all Foreign Ambassadors, Ministers, or Consuls-General, to obtain tickets for the strangers belonging to the nation they represent, without the formalities formerly insisted upon in such cases.

By these arrangements the privileges of Fellows are very substantially enlarged, and at the same time the utility of the Society will be much increased.

---

THERE is an amusing book called "The Art of Pluck," in which are given full instructions how a young man, when he commences his course of university education, may best ensure *not* getting a degree; what he should do to ensure being plucked at his examination, and how, by suitable reading, occupation, and companions, he may best fit himself to become a disgrace to his college. The book is cleverly written, and though, perhaps, its real use

may be questionable, yet it is witty and entertaining; for everything that a young man should not do is gravely and seriously described and recommended, as if university disgrace was above all things the most desirable distinction a young man could strive after; and as though this praiseworthy end could only be attained by the most constant and unremitting care and attention! We have often thought that an equally entertaining, and perhaps more truly useful book might be written for the use of gardeners, and those who cultivate the soil generally, "on the best mode of cultivating weeds;" and this, perhaps, might be well followed by "hints to landlords how to diminish as much as possible the value of their estates, and to increase the growth of vermin." The idle habits, vulgar associates, and dissipated vices which form the stumbling-blocks of the young student, are not more injurious at the time, nor more fatal in their consequences, than the deep-rooted prejudices of sensible practical men, when the old rule of thumb once gets the ascendancy over their minds, and leads them to persevere even in what they know to be wrong, merely because "they have always done so."

When a gardener has some choice and scarce seeds, or when he is endeavouring to raise a particularly early crop, he takes more than ordinary care with them. He selects some good soil, sows his seeds, waters them enough but not too much, and takes the greatest care to fit all the conditions to the nature and requirements of the young plants. If he is anxious to hurry on the germination of the seeds, so as to bring the young plants forward as rapidly as possible, he gives them a little bottom heat, sowing the seeds in fine mould resting on half rotten dung, because, under those circumstances, the gentle heat of the still fermenting manure, and the vapours which it gives out, are highly favourable to the germination of the seeds. This is one of the best known modes of raising young plants; for notwithstanding all that has been said about seed steeping, and other wonderful modes of accelerating the growth of plants, we have, at the present time, no more powerful mode of aiding germination, and forcing the growth of young plants. This is the plan adopted by the best gardeners with their choicest seeds; and, strange to say, it is also the mode very commonly adopted all over the country for the cultivation and encouragement of the most troublesome weeds!

The management of manure heaps is, no doubt, a very important affair to all who occupy themselves with the growth and cultivation of plants, whether on a large or small scale, and we are much obliged to the chemists who have pointed out the importance of fixing ammonia, and told us how that desirable end can be best obtained. But there is another matter equally important, to understand which we need no scientific knowledge, a little plain common sense being all that is required, and that is, the growth of weeds on manure heaps and mixens. A manure heap in the open air, exposed to all the changes of the weather, and placed, as is frequently the case, so that any water which drains away from it is altogether lost, must suffer injury in two important points; the volatile matters produced during the fermentation of the dung will be carried away in the air, whilst the soluble substances which it contains will be washed away by rain. ARTHUR YOUNG says somewhere, in one of his numerous books, "He who is within scent of a dunghill, smells that which his crops would have eaten if he had permitted it. Instead of manuring his land, he manures the atmosphere, and before his dunghill is finished turning, he has manured another parish, perhaps another country." There is a great deal of truth in this remark.

It is the custom in Cornwall to plant Cabbages on the dunghills; the plants grow often to an enormous size, and, though they generally have a bad flavour, being more or less tainted from the gross matters in which their roots have been feeding, yet it is found worth while to grow them thus, and for some purposes they answer exceedingly well. The Cornish farmers are often censured for this practice, as it is said that the manure must be greatly injured, a great part of its goodness being extracted by the Cabbages before it is, in fact, used. It is plain that a considerable portion of the goodness of the manure must be absorbed by the Cabbages; but it is quite another question whether any loss necessarily results. All that which the Cabbages absorb, and which contributes to their growth, cannot be said to be lost; though it is very doubtful whether it would not, for the most part, be really lost, and carried away in the air, if it were not for the Cabbages. Be this as it may, there can be no manner of doubt that it is better to grow Cabbages than to grow weeds, and this unfortunately is too often the case; for in many parts of England it is the constant practice to leave manure-heaps untouched so long that they become covered with a thick mass of weeds, growing in the most luxuriant profusion, blossoming abundantly, and bearing a plentiful crop of ripe seeds.

The man who wastes manure, by letting the volatile portions evaporate in the air, neglects his own interest, but he benefits his neighbours rather than injures them; on the contrary, he who cultivates weeds on his manure-heaps (thus giving them all the advantage of abundant manure and gentle bottom-heat), whilst he injures himself, at the same also injures his neighbours. A single weed is easily and rapidly destroyed; but, when it has been suffered to grow and produce hundreds of seeds, which are then spread over a large surface of ground, its extermination becomes a serious difficulty. We have sometimes seen a piece of ground most carefully cleansed, and then well manured with a good dressing of rotten dung, containing an abundant supply of weed seeds; and, if the evil were not so serious a one, it would be almost laughable to see a man thus, in the first case, taking such care to eradicate all weeds, and then, when he had done so, taking quite as much care to ensure a fresh crop of them, reared under the most favourable circumstances.

An immense deal of unnecessary labour is caused by the spread of weeds all over the country, which are sown broadcast, and carried about by the air over gardens and fields; a great portion of this evil may be traced to the cultivation of weeds in the way just adverted to, and to the frequent practice of keeping wide and foul hedges. Indeed, it will generally be found that the manure-heaps are made on some small piece of waste ground by the way-side, and surrounded by remarkably high and wide hedges, which serve chiefly to shelter weeds and harbour vermin. The seeds of these weeds must, of necessity, fall on the fresh manure placed by their side; the seeds germinate; the plants they produce grow with uncommon vigour, and consequently bring forth a very fine crop of seed, ready to be carried out, and sown with the well-rotted manure in which they have been raised.

The direct absorption of putrifying organic matter by growing plants is another and curious subject, which has been hitherto but partially examined. It is well known that plants are very differently affected by what are termed strong manures; for some can endure almost any quantity of it, not only without injury, but are even all the better for it; whilst others are at once damaged when their roots come in contact with such manure, and are soon killed by any large quantity of it. Plants, to a certain extent, possess the power of selection by their roots; that is to say, they absorb different substances, at a very different rate; and it is therefore presumed that, under natural circumstances, they only absorb those substances which are of service to them, and reject any others which are presented to their roots, and which are useless or hurtful. This may be true to some extent, but there are evidently limits to this power of selection, for plants are readily poisoned by the absorption of poisonous matters by means of their roots. It not unfrequently happens that a plant which has absorbed a considerable portion of strong manure, continues nevertheless to grow in the most healthy and luxuriant manner, although the manure which it has absorbed would have killed a more delicate plant. This is especially the case sometimes with highly manured vegetables, which even acquire a distinct flavour or taint from the manure used. Delicate plants, under such circumstances, are either at once killed, or they are poisoned by the introduction of putrid matter into their systems, and die after a short time. Examples of this sort of poisoning of plants are by no means uncommon, and, indeed, the Potato blight is of a somewhat similar nature; for whatever may be the primary cause of that disease, there is no doubt that the proximate cause of the destruction of the plant is disorganisation resulting from the presence of putrescent matter.

We had lately an opportunity of observing a curious example of this kind of action, in the destruction of some fruit trees in an orchard, resulting from the action of putrefying vegetable matter on their roots. A quantity of Grass cuttings having been heaped up, and allowed to ferment and heat, in an orchard, it was subsequently proved that whenever the liquor which drained from the heap soaked into the ground, and came in contact with the roots of the fruit trees, it gave them a blue colour; evidently diseased them, and by thus introducing poisonous matter into the systems of the trees, caused their death. If plants are able to absorb a small quantity of putrefying matter, which, though it does not kill them, is, nevertheless, poisonous, and would kill more delicate plants, it becomes a question worth investigating, whether plants which are cultivated for food may not sometimes, especially when they are highly manured, contain a small quantity of such poisonous matter? And if so, whether, though it is not enough to interfere with the growth of the plant, it may not tend to render it less wholesome as an article of food. When a plant grows naturally, it generally is able entirely to decompose such matters, but when it is over-manured that is no longer the case; and though a healthy animal may receive no injury whatever from eating such food, yet it is possible that during the prevalence of any disease or epidemic, over-manured and rapidly forced vegetables, containing a portion of putrescent matter, may produce serious effects, by introducing into the systems of animals matter which is unwholesome, if not poisonous.

## FOREIGN GARDEN GLEANINGS.

ST. PETERSBURGH PUBLIC PROMENADES.—The summer garden is the most remarkable of any in the town. This beautiful piece of ground is more than 800 yards long, and is bounded towards the west, by the Champ de Mars, and towards the north by the Neva. On this side is the magnificent iron screen erected by the Empress Catherine. It is 350 yards long, and is supported by 36 columns, each consisting of one solid piece of polished granite, resting on as many granite pedestals, and surmounted by urns with golden handles: the three large gates which are in it are as beautiful as anything can be conceived to be. The distribution of the garden itself is simple; a carriage way surrounds it; two alleys, shaded by old Lime trees, cross it from end to end. It is here that the inhabitants and *beau monde* assemble in innumerable numbers; but the place is deserted the moment hot weather sets in, and remains so until the spring of the following year.

ISLANDS IN THE NEVA.—The Neva, which runs through St. Petersburgh for a distance of about four miles, surrounds a dozen islands, which were formerly little better than quagmires, but were drained and laid dry in 1720; they are now beautiful gardens, and are dotted here and there with elegant country houses of such diversity of architecture that almost every style may be seen amongst them. Nowhere that I know of are there so many beautiful villas, fine groves, and delightful grounds; nowhere, in short, so much luxury for three or four months in the year. But I must leave these general features, and describe what is more interesting to gardeners in general.

YELAGUINE ISLAND.—To the left of Kaméni-ostroff, and a mile and a quarter from St. Petersburgh, is situate Yélaguine island, the private property of the Empress, who has converted it into a fine English park. The palace, situate in the middle of the park, and of modern date, can be seen through clumps of Weeping Birch, Larch, Scotch Fir, and Abies taxifolia. The place is crowded with visitors in the fine season. The garden in front of the palace is worthy of notice; its circular walks, carefully covered with red sand, contrast strongly with a thick turf broken here and there with small beds of bushes and herbaceous plants in full flower; the garden and its hothouses are under the care of a M. Bouch, a German gardener.

The hothouses are, for the most part, filled with young and healthy tropical plants: there are a great many Camellias, but they are small; the Rhododendrons, on the contrary, are remarkably fine. M. Bouch appeared to us to be eminently successful in the cultivation of small ornamental flowering plants; he rears with the greatest success several varieties of Antirrhinum, Verbena, Calceolaria, Wallflowers, Petunias, Phlox, and particularly of the pink Drummondi and white Drummondi, which, grouped in masses on the Grass plots, produce a very pleasing effect. We may also mention the small Chinese Dianthus, Eutoca, Bartonia, Coreopsis, and Gilia. The turf is remarkably close and fine. Instead of Lolium, which perishes annually, M. Bouch chooses fine but common Grasses, which are better suited to the climate and do not trample down; the Grass, in fact, appears to us to be perfection.—*Masson's Report.*

## BRITISH SONG BIRDS.

[CAGE BIRDS, No. 3.]

No. XIX.—The average duration of a canary's life, in the hands of a kind master, is from 16 to 20 years. With *me*, the "oldest inhabitant" lived 15½ years. Not long since, there was one to be seen, at the house of Mr. William Spooner, Wood-lane, Shepherd's Bush, strong and vigorous in his 21st year. He was even then rich in song; but, about the middle of that year, his legs were getting gouty, and his sight was beginning to fail. He died before he had attained the age of 22. I never remember to have seen a finer bird, in every respect. His affection towards his master and mistress was, as is usual with these birds, firm to the last. They sorely mourned his loss.

In order to secure longevity for your birds, be careful in the selection of your cages. Herein lies the grand secret. The cages generally in use, are altogether ill-adapted to comfort; being open to the air at every point, and admitting a succession of draughts from morning till night. Hence the cause of so much sickness, and of so many deaths. Birds so attended to, speedily become asthmatic; and seldom live more than three or four years, as daily experience shows.*

* A "Naturalist" asks me, why I consider the canary, when first brought over to this country, was "tender and difficult to rear?" In addition to its being recorded as an "historical fact,"

Above all things, religiously avoid the circular, open-barred brass cages, with sliding doors, now so much in vogue. I mean those resembling a parrot's cage, on a reduced scale. They are frightful instruments of destruction; bringing full many an innocent songster prematurely to his place of final rest. The brass, I need hardly observe, when water lodges on it, presents gangrene; and this, when tasted, produces sometimes a lingering, sometimes sudden death. All manner of "cheap" cages, too, must be discarded as inadmissible. They are made of dry deal, and invariably harbour vermin. Of these latter, I shall, ere long, have to tell a pretty tale. As a rule, buy no cages whatever, excepting those made of mahogany.

The proper description of tenement for a canary, is a mahogany cage, 12 inches long, 10 inches high, and 8 inches deep. The top, back, and one of the sides, should be of wood; the other side should be of wire-work (also the front), so as to admit the air, and at the same time exclude a thorough draught. Over this wire-work should be a wooden slide, running in a groove. It might then be used, or not, as occasion might require. The cage, inside, should be painted white. This, if your bird were of a fine bright yellow colour, would show him off to advantage. The external ornaments to your cage may, of course, be applied *ad libitum;* and every body can consult his own taste.

A long, square but narrow perch, should run from end to end, about the centre of the cage; and a second, of a similar kind, directly behind the two tin pans inserted at the front of the cage (one on either side) to hold the seed. In the middle of the wirework, at the front, should be a hole, sufficiently large to admit the bird's head while drinking. Never use glasses or fountains for holding water; but receptacles of tin, suspended by bent wires. Glasses, and glass fountains, are apt to get displaced; and many a prisoner dies for want of water, thus unthinkingly removed beyond his reach. By having these two perches only, the bird's feet will be kept clean, and he will have plenty of room for exercise, without injuring his plumage.

A bird, thus lodged, may be placed anywhere, or hung out of any window. He will never know what fear is, and he will be steady to his song. It is quite a mistake (irrespective of its being cruel), to place *any* bird in an open cage, if you wish him to sing well. By allowing him to gaze about, his attention becomes distraught, and his thoughts are divided. So well do the Germans know this, that they frequently run *red-hot needles* through the eyes of their choicest birds, with a view to keep them "intent upon their song alone." These fiends, habited in the shape of humanity, rarely have the temerity to send any of their birds, so mutilated, over here. All honour be to our nation, for "setting their faces" resolutely against any such frightful atrocities.

When hanging your birds out in the garden, or at an open window, avoid as much as possible exposing them to the intense heat of a scorching sun. Although protected from its baneful influence by the covered roof of their cages, to a certain extent, they yet run considerable risk of being killed by a *coup de soleil*—the fate of many a noble songster. The bough of a tree, well covered with foliage, is what they delight in. This should be allowed to depend from the top of their cages. So protected, they will not be annoyed either at the sight of a cat or dog, or any other noxious animal—indeed they will be strangers to fear of any kind.

The proper food for this tribe is Canary, Flax, and a small quantity of Rape seed. All these should be new, and of the very best quality. It is miserable economy to purchase "cheap" seed. It will assuredly injure, if it does not kill your birds. Every morning the seed should be carefully examined, the husk removed, and the tins replenished.

The bottoms of your cages should be well cleansed, thrice weekly, and be kept well covered with red gravelly sand. It is also desirable to have a small quantity of old mortar, well bruised, mixed with it. In addition to the water supplied in the tin, it is always expedient to have a square earthenware bath, fitted in a mahogany frame, ready for daily use. These are so made as to be easily suspended on the doors of the cages, when the latter are opened. They are over-arched with wire, to prevent the birds escaping, and are obtainable of almost any dealer. Never let a day pass in the summer season without administering the bath. It is a grand secret of health, and assists wonderfully in keeping your birds in fine feather. In the winter, forbid its use altogether.

To make your pets familiar, give them every now and then a small quantity of yolk of egg, boiled hard; and a small quantity of German paste, mixed with a stale sponge cake. Put this, lovingly, into a little "exclusive" tin pan, fitted in a sly corner of the cage, and the "treat" will have a double charm. These innocent little creatures love to flirt with any "nice pickings," thus mysteriously conveyed to them, and they will keep on chattering to you, in a language of their own, for many minutes, while viewing the operations in which you are actively engaged for their particular benefit. How many happy hours have I spent, in days gone by, in thus harmlessly participating in the enjoyment of my little friends! *William Kidd, New-road, Hammersmith.*

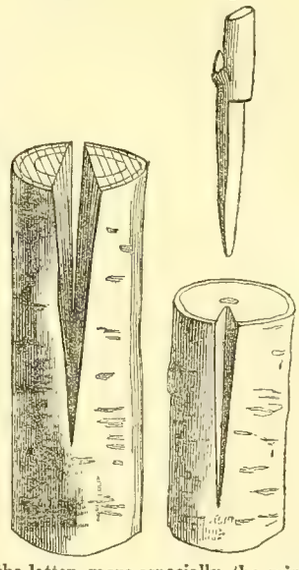
I imagine that though these birds love hot climates, the cause might proceed, in no small degree, from the ignorance and want of skill exhibited in his care and culture. It is of late years, more particularly, that he has been fully studied; and that his inherent excellencies have been duly appreciated. Now, in fact, he may be said to be acclimatised. He is, indeed, one of the hardiest of our song birds.

## MARKET GARDENING ROUND LONDON.

No. VIII. Brussels Sprouts.—These are not sown until May; but it should be March. The Scotch sow them in August. Sown in May, it is impossible for the plants to get tall, stout, and cover the stems so well with fine large close Sprouts, as when sown in March. I have had them three feet high, covered from top to bottom, each stem producing one peck of large close Sprouts. Brussels Sprouts are always dear, and the poor and middle classes hardly know what they are. Their cultivation is very simple; sow in beds, and transplant when the plants are 4 or 5 inches high. Select, if possible, a rich stiff loam for them; plant 18 inches plant from plant, and 2 feet row from row: keep the ground well loosened with the hoe. Moulding up the stems is never practised, and as soon as the plants reach their height, which is known by the top beginning to cabbage, *the latter ought to be pinched out.* This throws all the strength into the Sprouts down the stem, making the bottom ones as good as those on the top. I am well aware that the present plan of producing them does not pay the grower, even at the high prices obtained for them, but that is his own fault; and if some good farming gardeners, who cultivate the land well, would take to growing this vegetable, even if it were but to feed cattle with, it would answer their purpose. It is perfectly hardy; it does not rot, like Drumhead Cabbage and Savoys, and an immense acreage of it might be obtained.

Beet-root.—This is in great demand during winter. Growers are very particular about the time of sowing it; for one week too soon sown spoils it. It is generally put in about the first week of May; but even with the same seed and the same soil it makes a great difference if it is transplanted; because, in removing the seedlings, all forked ones are thrown away. In this operation great care must be taken that the points of the roots are not broken off. Beet is generally planted out about a foot apart each way. It is wintered in large sheds, stored in moderately damp mould, and banked up with straw. It is a mistake to pack it up in dry sand or earth for the winter, and the same may be said in regard to Carrots, Parsnips, Salsify, Scorzonera, and similar roots. Dark coloured Beets are not esteemed; but they are much richer and better than the pale kinds.

Globe Artichokes.—These require very rich deep land; when planted they are thinned out to three or four plants in each stool every spring. They are well supplied with manure every winter. I have seen an acre which had not been fresh planted these 10 years. A famous plan, where the land is stiff and clayey, is to dig out a trench 18 inches deep, and fill it up with a mixture of dung and mould, and in spring to plant out on this mixture. I have practised this system with Asparagus, taking out a spit and filling in the furrows with dung and mould, and planting out in April.



Spinach.—The prickly is sown from the 12th of August to the 1st of September. It succeeds whatever crop is removed at the time. It is sown in beds 5 feet wide. It grows best and finest upon light deep land, on which it is less liable to canker. New Zealand Spinach is not grown for market, neither are the silver Beet leaves, both of which are most useful, and are much used by the French, who are also fond of Orache, a capital substitute for Spinach.

Broccoli.—The only sorts grown for the London markets are the Walcheren, Grange's Early White, Late London White, Purple Cape, and the Purple sprouting Broccolies. These are all sown in May; they are planted after a crop of Lettuces, Radish, or any of the early crops which happen to be cleared off the land at the time. The only formidable enemy to Broccoli is clubbing; they are, therefore, sown in the richest land, and far more are raised than are wanted. If any club, therefore, they are thrown away at transplanting time. They never make good plants afterwards. I have seen an acre planted upon a deep rich soil, and another acre on hungry gravelly soil, the plants being from the same beds; the latter were almost wholly worthless on account of clubbing, while the former all escaped. *James Cuthill, Camberwell.*

## GRAFTING.

No. VIII. Cleft-Grafting with a single Scion, formed as the preceding; the stock cut horizontally: fig. 7. (*Greffe Atticus of Thouin.*)—Some additions have been made to this mode of grafting, in order to avoid repetition, seeing that they often employ modifications of it for large tubercular roots, herbaceous stems, &c., on which they graft, with good success, young herbaceous twigs, and others; but it is a bad proceeding for woody plants in all cases where the stocks are as thick, or thicker, than the little finger, because their transverse horizontal section is difficult to heal. But for small stocks, only two or three times the thickness of slender scions, such as we meet with in the state of small shoots, bearing leaves, sometimes flowers and fruits, it is well adapted; in this case these young shoots are split on one side,* see fig. 8.; and in this cleft the scion is introduced. If it should happen that the latter be too large for the stock, cleft as already detailed, and of which the fibres are not sufficiently elastic for permitting the scion to be inserted, we take off from the cleft one or two small parings, so as to give it a triangular form (see Fig. 7); in this case we modify also the cut of the scion, in order that it may fill exactly the opening prepared for it.

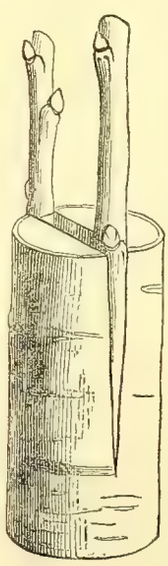


Fig. 7. Fig. 8.

By this method of grafting, and its modifications, we may propagate a great many hard-wooded evergreens; and likewise many with herbaceous stems or branches; such as the young shoots of Pelargoniums; Melons on Gourds and Cucumbers, Tomatoes on the stems of Potatoes, Sunflowers on the Jerusalem Artichoke, &c. For the latter, more especially, the minute care of shading, which we have mentioned, is indispensable.

Cleft-grafting with two Scions: fig. 9. (*Greffe en fente à deux rameaux.*) (*Greffe Palladius, of Thouin.*)

Fig. 9.

*Operation.*—The stock, as may be seen, is cut horizontally, then split across the middle in two equal parts, or nearly so, without regarding the medullary sheath (*a maxim strongly recommended by ancient authors.*) The operations are similar to those required for the Bertemboise mode, fig. 6, excepting that the stock is cut across horizontally, and two scions are inserted in the cleft. This mode is only used for stocks that are too large for one scion, and too small for being cleft for four. In many cases we cut back one of the grafts when both take, if their growths are likely to prove injurious to each other. This, however, is not the case when these grafts are intended to form either fan-trained, or vase-shaped trees. We also use this mode for grafting the strong stem of a bad sort of Vine with a better variety; but the wood of the Vine being flexible, it is necessary to bind, securely, the parts operated upon; then, when the graft is above ground, and generally exposed to the sun, we cover the wound with the resinous composition, binding the whole with a piece of cloth, in order to prevent the composition from being loosened, or even thrown off by the flow of sap, formed in the small vesicules, which being evacuated, weakens the stock, and consequently the graft, which in this case runs the risk of perishing. Vines ought to be grafted when their sap flows abundantly from one or more small trial cuts made on their stems. [To prevent bleeding they should be in leaf.]

Fig. 10.

Cleft Grafting (*Paragraph 2d*); with Stock and Scion of equal Size: fig. 10. (*Greffe Ferrari of Thouin.*)—This is applicable to herbaceous and to woody parts.

*Operation.*—The scion, of whatever nature it may be, should be cut wedge-shaped at the base; the stock should be split down the middle, and the two parts thinned as they are represented, in order that the wedge-shaped part of the scion may fill all the space, and coincide in every point. This particularly nice mode may be applied to many woody plants, and to a great number of large herbaceous ones. *Translated from the French of D'Albret.*

* When we adopt this mode of grafting on herbaceous stems or branches, they ought to be cut above a leaf, or young branch; then the cleft should be made opposite to them, and these small productions from the stock immediately below its section, ought to be preserved almost entire until such time as the graft shall have completely taken.

## TRADE MEMORANDA.

Who is Mr. John Wild, of Fetter-lane, Manchester? and who is his companion, who lives in Park-place of the same town?

## Home Correspondence.

*Mixed Flower Beds v. Masses.*—I rejoice to see your correspondent "Pharo's" remonstrance against the universal adoption of the bedding system, and his remarks in favour of the much-neglected hardy perennials. Allow me to suggest the re-introduction to notice of many very beautiful North American plants, which have been so neglected as to be nearly if not wholly lost. Among them are some of the Trilliums, the Sanguinaria

Monarda fistulosa, and some of the Phloxes and Aquilegias, quite as hardy and beautiful as those in cultivation, and a vast number of others. The quick and constant communication with North America would render it easy to procure all plants from thence, if you could once turn the powerful tide of fashion in their favour. A list of a few of the best from time to time in your pages would be most useful, and also hints of where the best collections of plants of this description can be procured. One consequence of the small demand for this class of plants is that they are, when found in a nurseryman's collection, in general much dearer than they would be if more frequently enquired for. *A Lover of a Gay Flower Garden.*

*The Variegated Holly.*—This plant, properly a shrub, seldom assumes the importance of a timber tree. Indeed, the only instance of this which I have ever seen is at this place, and no doubt many of your readers who have visited the Scruton Nurseries will recollect the tree—a few yards from the front carriage entrance gate to Mr. Jackson's residence. Its length, from the ground to the first branches, is 12 feet; the circumference of the bole, 6 feet from the ground, is 4 feet, and the height is 36 feet. It is nearly 300 years old. *J. Carnegie, the Nurseries, Scruton, Bedale.*

*Lycaste Skinneri.*—This Orchid ought to have a place in every stove, for it is truly a beautiful object. During these two years past, a young plant has flowered here in January, and the blossoms remain in perfection for six weeks at a time; at present it has seven open blooms on it, each about 4 inches across. It grows freely in peat from which the earthy matter has been shaken, but it likes plenty of drainage, a moist atmosphere, and shading from the sun in very hot weather. The temperature I have grown it in has been from 55° to 70° in winter, and from 65° to 90° in summer. *I. Rust, Pashley, Ticehurst.*

*Snow's Superb White Broccoli.*—With me this has proved by far the most valuable winter Broccoli that I have ever seen or cultivated. With it I have been enabled to supply my employer's table every day since the beginning of December with heads equal, or nearly so, to any Cauliflower, however fine. In fact, its general character partakes more of the Cauliflower than the Broccoli, being dwarf, close, and compact. When it approaches maturity numerous small leaves fold over the centre, so as to envelop the head and protect it in a very considerable degree from frost; but this has not been a season for testing its hardiness. I have had it excellent in the open quarters, but the principal part of my crop was carefully stored beyond the reach of frost, however intense it might have been. To those who prefer good Broccoli in the depth of winter, this variety will be found an acquisition. *G. Fry, Manor House, Lee, Kent.*

*Begonia Fuchsioides.*—In one of your recent Numbers I saw an article on the successful flowering of this Begonia under pot culture. I have a very fine specimen, some 10 years old at least, grown in a bed in a conservatory, and trained up a rafter, but no means have yet been able to make it flower, with the exception of one summer (a very hot one), when it was quite a show. Perhaps some of your correspondents can give me some useful hints on the subject. *A. M.* [We are not aware that any better directions can be given than those at p. 87 of the current year's volume.]

*Rhubarb.*—I am induced to offer you a few remarks on the merits of Mitchell's Prince Albert Rhubarb. In February, 1850, I bought 10 strong roots of this variety from Messrs. Low, of Clapton; these were divided into as many as 30 buds. I planted each bud 3 feet apart every way on a south border, which had been previously well trenched and manured. They grew rapidly. During the season I gave the roots twice a soaking of liquid manure; and in the following summer we gathered several dishes from them. In the latter part of October, over half the roots, I placed Seakale pots, and covered the latter with leaves, and by the third week in December most of the pots were full of strong stalks, equal to any I saw exposed for sale at the same period; and they have continued to yield up to the present time. The roots which have not been excited have now stalks issuing from them 6 inches in height. The flavour of this Rhubarb is excellent, and it is very productive. It is very suitable for early forcing. *John F. M'Elroy, Gardener to W. J. Lancaster, Esq., Stamford-hill.*

*Bouquet Trade in New York.*—The following extract of a letter from a young acquaintance at New York may be interesting to some of your readers:—"New York, Jan. 20, 1851: Last week I made up a bouquet for the world's fair. It was put into a patent metallic safe, the lid screwed down, and the air extracted. I fear it will not answer, but the patentee says he has proved it before. I had to see it deposited, and then made affidavit, that I made it, and saw it placed in the safe, then, and there—so you will have a chance of seeing a specimen of our 5 dollar bouquets. It has fine white Camellias in it; of course, it will be shown amongst the New York State division of the American department. On New Year's morning we sent out above 200 dollars' worth of flowers, arranged in bouquets, baskets, and vases. Six of us were at work all night. These were principally ordered by young gentlemen, as new year's presents for their lady acquaintances, upon whom they call on that day. It is laughable to see the driving, and running about, from house to house; there being full liberty to take and introduce any of their friends on that occasion, and it is generally taken full advantage of by the gentlemen. The ladies, on their part, pride themselves, and boast of the number of their visitors. This is done by all ranks in New York." *J. Little, Langholme, N. B.*

*Chiswick Temperature* v. *Holkham.*—The table which accompanies this contains the Chiswick observations for January, as given in the *Chronicle*, and the comparison of the Holkham observations of minimum thermometers in three different positions; the first column being those taken according to the Chiswick method, and the remaining two by our usual plan for minimum observations. The result shown at the foot of the first column appears to corroborate the remark in my last communication, giving a higher night temperature at Holkham than Chiswick, which our proximity to the sea would lead us to expect, while the series display the singular fact of the reading of a thermometer placed but a foot above the ground, and fully exposed to the sky, being but 0.2° below one placed at 4 feet from the ground, protected fully from radiation, and nearly 4½° higher than another thermometer on the Grass immediately beneath it. The occurrence, however, of an overcast or a perfectly cloudless night, we find, has a material effect on the difference between the first two, while the difference between the readings of the exposed thermometer is much more constant. The points, however, with which we originally started, the remarkable difference occasionally between the temperature of the two places, do not seem to receive any satisfactory explanation at present, nor does the number of the discrepancies decrease as the readings of the 4th, 9th, 10th, 13th! 16th, 18th, 19th, and 23d sufficiently testify, although the occurrence of the + sign in clusters, with the greatest difference on the intermediate day, would seem to point to a more satisfactory result than the suspicion of error or negligent observation. In the table I have placed the several temperatures opposite to the days on which they are read off, according to the plan we adopt, and on each day throughout the lowest reading has occurred previous to 9 A.M., the time of observation. The following is the table alluded to:

| Chiswick. Minimum—recorded between 10 and 11 A.M. on each day named. | | Holkham. Minimum—recorded at 9 A.M. on each day named. | | |
|---|---|---|---|---|
| 1851. | Minimum at 1 foot above (?). | 1 ft. above Grass. + Higher. — Lower. | 4 ft. above soil, protected from radiation. + Higher — Lower. | On Grass. + Higher. — Lower. |
| January 1 | 50 | — 1.8 | — 3.3 | — 6.8 |
| " 2 | 51 | + 0.5 | + 0.4 | — 3.2 |
| " 3 | 43 | — 5.5 | — 2.8 | — 8.7 |
| " 4 | 35 | + 7.2 | + 6.8 | + 4.7 |
| " 5 | 39 | + 1.8 | + 1.2 | — 3.5 |
| " 6 | 24 | — 1.0 | + 2.7 | — 2.0 |
| " 7 | 31 | — 7.5 | — 4.8 | — 8.0 |
| " 8 | 27 | + 4.2 | + 6.0 | + 0.6 |
| " 9 | 27 | + 7.0 | + 6.3 | + 2.6 |
| " 10 | 23 | + 8.5 | + 8.0 | + 3.0 |
| " 11 | 39 | — 0.2 | + 0.2 | — 3.5 |
| " 12 | 45 | + 1.0 | + 0.2 | — 4.5 |
| " 13 | 47 | —15.8 | —12.0 | —19.0 |
| " 14 | 44 | — 6.5 | — 9.0 | — 8.2 |
| " 15 | 40 | — 2.2 | — 2.0 | — 8.2 |
| " 16 | 28 | + 7.5 | + 7.8 | + 1.3 |
| " 17 | 40 | — 3.3 | — 3.8 | — 8.0 |
| " 18 | 27 | + 7.0 | + 8.0 | + 2.5 |
| " 19 | 28 | + 8.0 | + 7.2 | + 2.5 |
| " 20 | 35 | + 1.2 | + 0.8 | — 4.6 |
| " 21 | 40 | — 4.2 | — 3.5 | — 8.0 |
| " 22 | 30 | + 2.6 | + 3.0 | — 1.7 |
| " 23 | 23 | + 9.0 | + 9.4 | + 4.5 |
| " 24 | 22 | + 5.2 | + 8.0 | + 1.2 |
| " 25 | 25 | — 0.8 | + 2.0 | — 3.2 |
| " 26 | 29 | + 4.6 | + 2.3 | — 2.2 |
| " 27 | 28 | + 6.3 | + 5.8 | + 0.4 |
| " 28 | 27 | + 2.7 | + 5.0 | — 2.0 |
| " 29 | 39 | — 1.0 | — 1.4 | — 7.2 |
| " 30 | 32 | + 2.3 | + 1.6 | — 3.0 |
| " 31 | 30 | + 1.3 | + 0.8 | — 3.0 |
| Means | 33.7 | + 1.23 | + 1.64 | — 3.67 |

*S. S., Holkham, Feb.* 10. [It will be seen, from the above table, that in some instances the indications of our correspondent's three differently situated thermometers nearly agree with each other; but that at other times they differ as much as 7°. This being the case he cannot be much surprised at an occasional discrepancy of 15° between thermometers so far apart as Holkham and Chiswick; the one probably acted upon by a north-east wind, and the other by a south-west. At all events such discrepancy will cause little astonishment to those who have long been in the habit of comparing returns of temperature from many parts of the country. The observations at Chiswick are correct; and we see no reason to doubt the correctness also of those at Holkham.]

*Beech Trees.*—Observing at p. 87 some interesting remarks on re-invigorating old forest trees, I thought, perhaps, some of your readers could inform me what would be the proper food for Beech trees. The plantation (intermixed with a few Oaks and Firs) is, I suppose, nearly a hundred years old. It is situated on the side of a hill in a sandy soil, and invariably when the Beeches have arrived at a certain growth they appear, after a little time, to die away gradually. This is attributed by some to the roots having spread down through the sandy soil, and reached the gravel below. For many years it has been the custom to rake the dead leaves up every autumn, and I have lately been more particular in having this done, in order to promote the growth of the Grass underneath, for the sake of appearance. *Nemus.*

*Forcing Peaches.*—My object in the following remarks is to throw out a few useful hints to young gardeners, respecting the management of the early Peach-house. After shutting up the Peach-house, pruning and tying may be proceeded with, and should the house contain old trees which have long been forced, it might be advisable to paint them over with the following composition, viz., four gallons of soft water, one quart of train or whale oil, half a pound of flowers of sulphur, two pounds of soft soap, one quart of tobacco water, together with sufficient clay to give the whole the consistency of paste. Apply the mixture with a sponge or soft brush, made of bast, keep the composition well stirred up from the bottom, dip your sponge or brush into it, and gently draw it up the branches two or three times so as to give them a good coating of the material, more especially the older branches, closely examining all cracks and apertures where the larvæ of insects are likely to be found. This operation being accomplished, fork over the borders carefully, so as not to injure the roots, and at the same time mulch inside and outside with fresh cow manure, giving the whole a supply of soft water sufficient to penetrate to the bottom of the borders. If, however, they have been previously properly attended to, they will not require such a deluge at this time. The house having been shut up since the middle of December, in order to have ripe Peaches about the middle of June, light the first fire early in January, and should frosty weather prevail, maintain a temperature between 45° and 48° as a minimum, allowing a range of 10° higher before you admit the external air, of which, in favourable weather, you can hardly have too much, provided the inside temperature is not permitted to fall too low. If frost is excluded, the slower the sap is put in motion the stronger will the flower-buds break, and the wood-buds will push with greater regularity and strength. The maintenance of a steady temperature is of the utmost importance, both to the trees and the crop. The fire heat should never be so great as to compel you to give air before the external temperature has been warmed by the rays of the morning sun. By that kind of over heating, you are forced to ventilate, in order to prevent burning, and thus you expose your tender shoots to cutting wintry winds. About the middle of the month, the temperature may be raised some 4°, using the syringe morning and evening, with a view to facilitate the expansion of the buds. About the beginning of February, the temperature may be slightly increased, and, as soon as the buds begin to expand, the use of the syringe must be discontinued, for a superabundant supply of water, either at the roots or over the branches, would prove injurious. In order, however, to keep the air moist, sprinkle all pathways, &c., but do not allow any water to fall upon the hot flues or pipes. This latter would cause a burning steam to ascend, which would be injurious to vegetation. The house ought now to assume a gay appearance. Air should be admitted freely upon every bright day, and also on dull days, if the weather is mild, using a little extra fire to keep up the heat. Airing materially strengthens the blossom, and insures its setting. About the middle of the month, if all has gone on well, the fruit will begin to exhibit itself. The temperature may now be raised 2° or 3° with safety. The syringe may be again applied gently, night and morning; but never use it in the morning until the sun's rays are sensibly raising the temperature of the house. From the 26th of February to the beginning of March the fruit ought to be swelled to the size of large Peas. At this stage, syringing may be employed freely until, say, the 6th of April, about which time the fruit will begin to stone; and from that time until the 12th of May the syringe and watering-pot must be sparingly used, or the fruit will drop off. I would not advise a higher temperature to be maintained yet than 60°, for the Peach is very impatient of much heat and close confinement. By the end of May the stoning process will be completed; and, if fine fruits are wanted, they should be thinned out to 9 or 10 inches apart, or even more; but weakly trees ought not to be permitted to produce above half that quantity. The temperature may be gradually raised to 65°, giving air when the house is raised to 75° by sun heat, and the fruit will now be in its last stage of swelling, when water may be liberally supplied, both to root and top. This will have the effect of keeping down red spider; and if green fly appears, fumigate with Tobacco before the fruit begins to ripen. By the beginning of June the fruit will begin to change colour. Relieve any that are covered with leaves, and admit air freely as maturity approaches, by which means fine flavour and high colour will be obtained. Watering must now be discontinued; begin first by withholding it from the roots, and spare by degrees the use of the syringe, until the whole be left off. Ripe fruit may be gathered about the middle of June, if the above hints have been carefully put into practice. *J. M., Eardeston.*

*Cyclamens.*—Permit me to direct attention to that much neglected, but really beautiful plant, the sweet-scented Persian Cyclamen. Surely it must be an idea that it is difficult to cultivate that keeps it so much a stranger to our greenhouses and window-gardens; few plants, however, are more easily managed or better repay the attention they receive. The Cyclamen being a fleshy bulb, and never throwing out any off-sets, it can only be propagated from seed. It naturally flowers about this season of the year; but if it is placed in heat it may be bloomed much earlier. While they are in flower, those who possess a few bulbs should select those which are sweet scented (for some of them have no scent at all), and place them in a greenhouse or fram

where they can have plenty of air. They will there produce abundance of seed, which, when ripe enough, should be sown as soon as it is gathered in seed pots or pans, well drained, and filled with equal parts of good loam, sandy peat, and leaf mould, or well decomposed dung. The seed should be distributed evenly, slightly covered with mould, and kept moderately damp. Early in autumn, the plants will begin to show themselves. They should remain in the seed pans till May following, when a bed should be prepared for them in the following manner :—Put down a layer of well rotted dung 3 or 4 inches deep, and upon this place a mixture of equal parts good loam, sandy-peat, and leaf-mould, at least 9 inches deep. On this plant out your seedlings from 4 to 6 inches apart, protect them by a frame or hand-lights, give plenty of air, and as the weather becomes warm remove the glasses altogether, and during the summer months keep them free from weeds, and water them when they require it. Early in September they should be taken up carefully, and potted into pots varying in size according to the bulk of the plants. Place them in a warm frame for a short time until they have taken hold of the soil, which should be similar to that mentioned above, with the addition of one-third well decomposed dung, and a little silver sand. At the general time of housing greenhouse plants, give them a good airy position in the greenhouse, and in the following spring most of them will yield a fair crop of flowers. Those who have no greenhouse may keep them in a cold frame during the winter months, removing them when they are showing flowers, to the sitting-room window, where, intermixed with Crocuses, &c., of different colours, lifted and potted from the open ground, they will make an attractive display. The Cyclamen should not be forced to rest as soon as it has done flowering ; for in that case the foliage is destroyed before it has laid up in the bulb a sufficient store of nutritive matter to sustain it through its forthcoming trial. When your plants have gone out of flower, place them in a cold frame and pay as much attention to their wants as at any other season of the year. In May turn them out in a sheltered spot protected from the mid-day sun. In September lift them carefully, pot them, and place them on the shelf of the greenhouse or in a frame. As the season advances a portion of them may be introduced into heat, where that can be commanded. These will blossom earlier than the rest, and in this way a long continuance of flower may be maintained. Some grow their Cyclamens in the same pots without shifting them for years ; but, although they may bloom well under this system for a time, the plan is not to be recommended. *Beta.*

## Societies.

HORTICULTURAL, *Feb.* 18.—J. R. GOWEN, Esq., Treasurer, in the chair. Mrs. Lawrence, of Ealing Park, sent a charming collection of Orchids, for which a Banksian medal was awarded. It consisted of a nice specimen of the long-tailed Lady's Slipper (Cypripedium caudatum), the handsome Lycaste Skinneri, Cœlogyne cristata, the white-blossomed Odontoglossum pulchellum, Cyrtochilum hastatum, the yellow Oncidium Cavendishii, and cut specimens of Heliconia Braziliensis. From Mr. Ingram of the Royal Gardens, Frogmore, came an exceedingly handsome Begonia manicata. It could not have measured less than 3 feet high, and as much through, and it was loaded with blossoms which had, however, suffered considerably from travelling. The same establishment also contributed three seedling Cyclamens in the way of persicum, beautifully grown and flowered. A Banksian Medal was awarded for these and the Begonia. Messrs. Lee, of Hammersmith, furnished a small example of Rondeletia (Rogiera) thyrsiflora, which promises to be useful. Mr. Cole, gr. to H. Collyer, Esq., of Dartford, sent the Nerium-leaved Allamanda. This proves to be a smaller flowered kind than the old A. cathartica ; but it is nevertheless handsome, and well deserved the Certificate of Merit which was awarded it. Mr. Gaines, of Battersea, contributed Centradenia floribunda, and Rondeletia thyrsiflora. Mr. Kinghorn, gr. to the Earl of Kilmorey, exhibited two beautiful seedling Epacrises. One, named Kinghornii, was white ; the other, grandiflora rubra, was red, tipped with white. A Certificate of Merit was awarded for the white one. From Mr. Hamp, gr. to J. Thorn, Esq., of Mawbey House, South Lambeth, came a large plant of the Tankerville Phaius, and a handsome Camellia tree (C. tricolor) some seven feet high, loaded with flowers and flower-buds. A Certificate of Merit was awarded for the Camellia. Blooms of two Rhododendrons, and the Corsican Hellebore, were furnished by the Hon. Fox Strangways, from Abbotsbury, in Dorsetshire. Mr. Fleming, gardener to the Duke of Sutherland, at Trentham, exhibited two bunches of Muscat of Alexandria Grapes, somewhat shrivelled, but excellently flavoured. These weighed respectively 1 lb. 1 oz. and 15½ oz. Along with them came a bunch of white Tokay, which was plump and good, and appeared as if it would have kept sound for at least a month to come ; but it was not comparable with the Muscats, as regards flavour. To this bunch, which weighed 1 lb. 5⅞ oz., a Certificate of Merit was awarded, on account of its fresh presentable appearance. Mr. Fleming stated that the Muscats were from a Vine grafted on the old white Tokay, which being a very strong grower, and continuing to grow late in the season, seemed not only to improve the Muscats, but to keep them plump and fresh for a month or five weeks later than those on Vines on their own roots in the same house. The bunch of white Tokay was cut from one of the stocks below the graft. Mr. Butcher, gr. to W. Leaf, Esq., of Park-hill, Streatham, furnished a large punnet of Cannon-hall Muscats, which in this case were not so well flavoured as the Muscats of Alexandria above alluded to. A Certificate of Merit was awarded them. Two very fine heads of "Penzance Broccoli" were shown by Messrs. Rendle and Co., of Plymouth, who stated that one of the heads weighed 3¾ lbs., and was 2 feet 10 inches in circumference ; the other weighed 3½ lbs , and was 2 feet in circumference. These weights and measurements are without the leaves. They mentioned that they have seen some heads with the leaves on which weighed above 30 lbs. Mr. Tye, of Birmingham, exhibited six Hyacinth bottles of various colours, and furnished with convenient wire supports for the flowers. These are handsome clever contrivances, and if cheap enough cannot fail to be universally approved of. —From the Garden of the Society came three species of Acacia, eight varieties of Epacris, Styphelia tubiflora (a useful winter and early spring flowering shrub), the two-coloured Corræa, a Cape Heath, the useful winter plant Selago distans, the sweet-scented Pittosporum undulatum, and Galanthus plicatus. The latter only requires to be known to be generally cultivated, for it is a great improvement on the common Snowdrop in point of size. The same establishment also furnished the following vegetables : — *Navet jaune de Finlande.* — Seeds of this were received from M. Vilmorin, of Paris. It appears to be a variety of the Malta Turnip. *Variegated Plumage Kale.*—This is used for garnishing ; but it is also much esteemed by some, when it is cooked like a winter Green. *Corn Salad.*—This is the common Corn Salad, which is now more used than it has been in this country ; but it is likely be superseded by the Italian Corn Salad, *Mâche d'Italie,* seeds of which are now amongst those that are distributed to the Fellows of the Society.

## Notices of Books.

*Beiträge zur Mycologie, von G. Fresenius, M.D., Erstes Heft.* Frankfort, 1850, 4to, pp. 38, tab. lith. 4.

THESE contributions to Mycology, however excellent in themselves, would not demand notice in our Journal, merely as descriptions of species, which have little to do directly or indirectly with its objects. It will be enough to say of the descriptions, notwithstanding some species are described as new, though published years ago, that they are, for the most part, good, and accompanied by useful observations, and that the figures, though far from being all that might be desired, have, as far as they go, an air of truth about them, but must be regarded rather as materials (disjecta membra) from which an idea of a species is to be formed, than as finished representations. For figures of two or three scattered branches of various forms, as seen under the microscope, will never convey a correct general notion, to which end a certain degree of tact is requisite, which makes all the difference between a first and second-rate observer. If we take, for instance, some of the complicated sketches of Messrs. Tulasne, though any practised microscopist will at once allow that such figures are, to a certain extent, ideal, in so much at least as every individual cell and thread has not been copied, for no hand, however delicate, could make such successful sections, yet there is a truthfulness about them which perhaps has never been surpassed.

It is not however to this that we wish especially to point attention, but to the circumstance that such a work should be undertaken in utter ignorance of almost everything that has been done in other countries for the last 30 years. The latest work of any English mycologist to which allusion is made is that of Greville, and the bare existence of such observers as Léveillé, Montagne, and the Tulasnes in France, or De Notaris in Italy, is not even recognised. Now we have the greatest respect possible for national feeling and genuine love of one's country ; but when that is carried so far as to create an indisposition to look beyond the limits, however extensive, to which the term of fatherland may be confined, especially in subjects of universal interest, and where the errors or negligences of one are a constant source of vexation and perplexity to every one whose studies run in the same direction, it certainly calls for reprobation. We are far from wishing to assert that such a feeling is common to German naturalists, though we could bring forward many instances to this effect. It is an invidious thing to point out individual cases, and we the rather avoid doing so, because some who began by an early disregard of a great portion of what had been published by their predecessors, have in their later works nobly redeemed their errors in this respect ; and in one instance, which we could name, with a measure of disinterestedness which is highly honourable both to the head and heart. Nor do we think that the evil is entirely confined to systematists ; for we have seen a tendency of a like nature in other quarters. It is the duty of every man, who writes on any subject, to take every possible pains to acquaint himself with the state of knowledge existant on the subject at the time ; or, to use the words of a celebrated lawyer, "to read up to Saturday night ;" but the author of the work before us has, at least, a quarter of a century to make up, notwithstanding the means of information which are available to every German, in such works as the "Botanische Zeitung" and many others of a more or less similar character. The native industry and powers of application which seem the birthright of every German, make everything in the shape of wilful neglect quite inexcusable ; and, if our remarks should be felt to be just, we trust that they will be received with the good-will with which they are offered, and induce a little more deference to authors whose works have been long before the public, and which cannot be neglected without reflection either upon the modesty or information of those who pass them by without observation.

## Miscellaneous.

*New Mode of Propagating Herbaceous Pæonies.*—Over a tuft of Pæony with herbaceous stems, place a box or pot without a bottom ; fill the box or pot up with well-worked vegetable mould ; the stems have then to make their way through this earth before they can produce any flowers. If the height of the box or pot is from 13 to 15 inches, it is of no consequence ; the stems always rise through this thickness, and always attain the height fixed for them, and then develop their flowers. The soil should be kept damp all the summer, in order that roots may be formed in a proper way. Towards November or December, the stems may be cut off flush with the bottom of the box or pot, for they will be found furnished with roots throughout their entire lengths. The same stems may be cut into lengths, and each length, having a bud and some roots, will, if placed in well-worked soil, produce a new plant. In planting these lengths, each should be covered with earth, about 2 inches deep, so that the plant may draw nourishment from the soil, and not be killed in frosty weather. In this way the stems of the double-flowered Pæonia officinalis, which are commonly annuals, become perennials, by the absence of light, and the obstruction artificially applied to their growth. All my experiments have been made on this plant, but I am convinced that similar results could be obtained from others of like nature. Although the common Pæony is exceedingly hardy and strong in constitution, no mode of multiplying it has been hit upon, except by dividing its roots, which greatly disorders the course of its vegetation. By the new process, many plants can be obtained, and the large roots of the original one remain undisturbed. Propagation by dividing the great roots is exceedingly easy, for each piece carefully treated gives in time a plant, but the plant thus obtained does not bear any flowers for the first three years, after which time development proceeds rapidly ; the new process above described is much quicker. Chinese Pæonies, which have been hitherto universally propagated by the division of their under-ground stem, may, I have every reason to believe, be multiplied in the new way. The common purple Pæony and its varieties are often planted in the most unsuitable situations ; they are put under trees in large parks, or in clumps in pleasure gardens ; their stems are consequently poor, and their flowers not half so large as they should be. Placed in proper situations the common height of the purple Pæony and its varieties is about three feet. In order that a tuft of Pæony may grow well, it should occupy a circumference of two yards, and be placed where the gardener's spade can never wound its roots. The plant likes to be left alone and undisturbed ; it does not like to be placed near other plants with long roots which intermix with its own, and deprive them of the moisture they require. It is only when these conditions are observed that fine Pæonies are produced ; if they are put under the shade of a large tree, their stems are weak, and are beaten down by the first storm of wind and rain. The space of two yards may seem unnecessary in the eyes of many amateurs, but let them recollect that it will soon be filled by stems themselves a yard long, and which spread out from a common centre ; besides the roots are longer than the stems, and ought not to be interfered with. There used to be, many years ago, in M. Molé's park, at Méri-sur-Oise, a horse-shoe plantation of clipped Yews. Between each Yew there was a Pæony ; there was plenty of room for the growth of the Pæonies ; they had plenty of air and light, were never disturbed in any way, and bore magnificent flowers which produced a very fine effect. I have never since seen so beautiful a plantation. The ground intended for Pæonies must be well dug and loosened at least 3 feet deep, so that the roots, which spread in every direction, may act freely and for a long time ; for these plants will continue to flourish for 40 or 50 years without showing any symptoms of decay, provided always they are never disturbed. The Pæony is one of the few plants not attacked by grubs and insects ; this is true of all its varieties. The earwig alone is sometimes found among the petals ; but they do not stay long, as the first fall of rain or heavy dew causes them to decamp. What we have said about the preparation of the earth is of special importance when we are dealing with the Chinese Pæonies, for their roots are as long again as those of the common variety, and their stems cannot acquire their proper height ; nor can their flowers attain perfection unless there is a plentiful supply of nourishment. Pæonia edulis requires peculiar attention, for its stems naturally grow 3, 4, or 4½ feet high. Pæonies are extremely useful for decorating gardens, as the quality of the soil is not of great consequence, and the beauty and odour of the flowers are of the highest degree of merit. *Duval ; Flore des Serres.*

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

As soon as the newly potted plants begin to grow freely, let attention be paid to the training and stopping

of the shoots, rather than allow them to expend their vigour in long rambling growths, which must be cut off when unmanageable, and perhaps when too late in the season to repair the injury thus sustained by the plant. Another portion of the stock of Gesneras, Gloxinias, &c., should now be placed in heat; and the former lot of Achimenes will be ready for potting off. Let them be put at once into the size of pot in which they are to flower, as no plant suffers so much from the checks and sudden starts produced by being frequently repotted. If they are treated as recommended, the size of the plants will be proportionate to that of the pots; and when these are filled with roots, the plants will naturally arrive at a flowering state. The opposite method of frequently repotting these plants causes the embryo flower buds to be metamorphosed into small scaly bulbs. They are most useful for decorative purposes when grown in a brisk bottom heat, with a liberal supply of top heat, and a free admission of air, as they make sturdier, better shaped plants than when grown in a close temperature; besides which, they are better enabled to endure the cold currents of air in the conservatory and other places, where they are generally placed when in flower.

### FORCING DEPARTMENT.

In preparing new Vine borders, pay particular attention to forming a good sound bottom, and making provision for thorough drainage; the great desideratum being to form a warm porous bed, which may serve as a medium by which suitable nutriment can be afforded to the roots. The soil should consist principally of warm, sandy loam, in which the Vine makes fibres much more freely than in soil of a stiffer, or more unctuous quality. The admixture of manure is of less importance, as any amount of richness can be added by means of top-dressings and liquid manure; but if the loam is light and open in texture, a small quantity of sheep, deer, or cow-dung may be incorporated with it: bone-dust is also a suitable manure for soil of this description, and is excellently adapted for the Vine, but should never be used with soil which is stiff and cold. Some lime rubbish and brick chippings should be added to render the border more porous. Look closely after Vines and Peaches, to see that the foliage is not being injured or destroyed; the former is liable to be attacked by a small species of beetle, which must be carefully sought for at night, that being the time at which it commits its depredations. Thrips and green fly should be destroyed, as soon as observed, by fumigating with tobacco. Figs, started about this time in a mild temperature of 45° to 50° by night, with a rise of a few degrees by day, and not hurried by too much heat at any after period, will stand a good chance of succeeding well; the rapidly increasing length of day, with brighter weather, giving them the advantage over those earlier started. If the soil is dry, let sufficient water be given to moisten every part thoroughly, avoiding rich stimulants, such as liquid manure and fat top-dressings, which at this period tend more to produce strong growth than good fruit. Cherries.—If the early started Cherry trees are now in bloom, let a drier atmosphere be kept up until the fruit is fairly set. The temperature should not exceed 50° by night, nor 60° by day, with a constant admission of air, but carefully avoiding cold currents. Very little air need be left on during the night, as a circulation is kept up by very small openings, especially when the pipes or flues are warm. Strawberries.—Plants put into the forcing pit in the end of December will now be in bloom; and a steady heat of 50° by night should be maintained, with a rise of 5° or 10° during the day. Air is indispensable to the health of the plants and the setting of the fruit; and care should be taken to open every light a little, according to the state of the weather, in preference to giving an equal quantity of air by opening only part of the lights. As soon as 5 or 6 fruit are set in each pot, they should be removed to the Peach-house or Vinery-shelves, and placed close to the glass near the ventilator. Some pans partly filled with rough grit or sand should be placed under the pot, which will thus be kept moist and cool during warm sunshine, while the superfluous water which passes from the pots can easily be emptied without the grit or sand going also.

### FLOWER-GARDEN AND SHRUBBERIES.

The propagating of half-hardy plants for bedding purposes should now be going on with activity. The following is the plan which we have adopted. About this time the beds are prepared by filling up to within a few inches of where the surface of the soil ought to be, with leaves and hot dung, which have been previously well fermented. The surface of the fermenting material should consist of leaves alone, as they are less liable to give off noxious exhalations; and, as an additional precaution, an inch of sand or coal-ashes may be laid over them. On this we lay 3 inches of light soil, and upon it 1 inch of sand, into which the cuttings are inserted. To assist in sustaining a strong bottom-heat, we have a hot-water pipe passing beneath the bed, which we make use of when there are any symptoms of the heat declining. The cuttings strike in this way very quickly; and after being fairly rooted, are taken up with balls of earth, and transplanted into cooler quarters, in frames of prepared soil. Much time is saved by this means, as the labour attending the draining and filling of pots is all avoided. The soil should not exceed 4 or 5 inches in depth, and should consist of one-third loam, one-third decomposed leaf-mould, and one-third sand, and may rest on a bed of coal-ashes. The young stuff should be set in rows from 4 to 6 inches apart, according to the habit of the plant, and the length of time which will intervene before they are planted out. By passing a knife or sharp trowel down into the soil, between and across the rows once or twice during this period, their roots will be prevented from intruding upon each other, and when required for planting out, they will lift with nice balls of fibrous roots. Their tops also must be kept within bounds by timely and periodical stopping. It is true that one of these plants will occupy more space under glass than two thumb pots; but it is no less certain that when the turning out season arrives, one of the plants grown as recommended will be worth half a dozen of the miserable things which have been starved in pots; besides which, the labour of watering is materially lessened, an important matter during the busy spring months. All kinds of plants intended for flower-garden masses come earlier into flower, and make greater progress if treated on this plan than when turned out of pots, in which they have been growing any length of time. We recommend particular attention to this, as we have practised it extensively for some years, and have found it to answer extremely well.

### HARDY FRUIT GARDEN.

To guard against the effects of late spring frosts, we again urge the necessity of affording artificial protection to the blossoms of our choice fruit trees, not on the walls only, but on those in the open ground also; this will be particularly required in damp low situations, where the slightest frosts do considerable damage. As a matter of course, gardeners will make use of canvas and netting as far as they will go; but as few have sufficient of these to protect all their trees, they will find the fan-shaped branches of Spruce or Yew a tolerable substitute. By applying these covering materials early in the season, the slight shade they afford prevents the untimely excitement which is the result of unseasonably warm weather during spring. The moderate sized espalier pyramidal Pear trees, which have a sufficient quantity of flower-buds to make it worth the trouble, may be protected by rearing a few small poles over them, tent fashion, and thinly covering them with branches of evergreens, which thus form an excellent shelter. Our success in protecting pyramidal Pears, and other fruit trees on trellises, induces us to press the necessity of protecting as many of these tender kinds of fruit trees as possible. It is satisfactory when our efforts are crowned with success; and should we fail, after doing all in our power, we are at any rate better satisfied than if we had not taken any precautions.

### KITCHEN GARDEN.

As soon as the ground is sufficiently dry to allow of the surface being pulverised, the main crop of Onions should be sown. The piece of ground selected for this crop should be well drained, and sufficiently rich to prevent the bulbs being too small; but, at the same time, the opposite extreme must be avoided, or the produce will be watery, thick-necked, and less likely to keep well during winter. Early sowing of this vegetable is essential, in order to get the bulbs matured and housed before the short sunless days of October. A second crop of Early Horn Carrots may now be sown, but the main crop usually suffers less from the maggots when sown in April, or even in May, than those which are sown earlier; and although the roots of late sown ones are somewhat smaller, their good quality generally makes them more profitable. An early crop of Stone Turnips should now be sown, and Asparagus seeds on the beds formerly prepared. Regular sowings of spring salads should be made in frames and warm borders. In planting out Cabbages, if you have more than enough for the regular crops, the rows may be planted only half the usual distance asunder, and the alternate rows drawn and used as Coleworts when about half-grown. A sowing of one of the larger Cabbages should now be made in a frame, and also some Cauliflowers for the earliest spring sown crop, with some more under a warm wall to succeed them. A sowing of Celery should also be made on a moderate hot-bed; it should be sown very thinly, that the plants may not require pricking out so soon; and that, when pricking out is necessary, they may be moved with more soil to their roots. It is especially necessary to grow the earliest crop with as few checks as possible, to prevent its running to seed. A successional sowing of round Spinach should be made this week. Garlics and Shallots should now be planted on dry ground, if it were not done in November as already recommended; they should be planted 6 inches asunder, on the surface of the soil, with merely sufficient fastening to keep the bulbs steady. Autumn sown Tripoli Onions should now be transplanted, 6 inches apart, in rich soil, for Midsummer use; they should be secured in their places by closing the soil about the roots, not about the bulbs, the bases of which should always rest upon the surface of the soil. The small button Onions, which were saved last autumn, should also be transplanted in the same manner; if the ground is good, without being over rich, these will make fine specimens by autumn.

State of the Weather near London, for the week ending Feb. 20, 1851, as observed at the Horticultural Garden, Chiswick.

| Feb. | Moon's Age. | Barometer. | | Temperature. Of the Air | | | Of the Earth | | Wind. | Rain. |

The highest temperature during the above period occurred on the 25th, 1846—therm. 64 deg.; and the lowest on the 25th, 1847—therm. 21 deg.

## Notices to Correspondents.

To Correspondents. The Editor trusts that his illness will excuse him for not having answered everyone this week, as usual.

Apple Trees: *Amateur.* We should prefer tying bundles of "Quick" or straw ropes round their stems to smearing them with tar or grease, with a view to prevent rabbits and hares from barking them. The other will do no harm, unless the plants are very young.‡

Books: *J H E.* Loudon's "Encyclopædia of Gardening" can be obtained in monthly parts. We never recommend dealers or give prices.‡

Cucumbers: *Ignoramus.* Cuthill's Black Spine.‡

Datura ceratocaulon: *Marianne.* If the seed is good you cannot fail to raise this with bottom heat, and the treatment given to the commonest tender annual. St. Bruno's Lily is hardy. Give your Roses plenty of manure; they seem to be starved. We presume that you mean the Azalea nudiflora; all the North American Azaleas are hardy.

Fruit Trees: *G D.* Although the Apricot succeeds on the Plum stock, it is doubtful whether the Apricot will prove hardy enough, if employed as a stock for the Plum. You may try the Greengage upon it.‖—*Hallett.* Six Pears to be trained as espaliers: Marie Louise, Passe Colmar, Glout Morceau, Knight's Monarch, Thompson's, Beurré Rance. Six Apples for the same mode of training: Bleuheim Pippin, Golden Reinette, Court of Wick, Ribston Pippin, Old Nonpareil, and Scarlet Nonpareil.‖—*R K J.* The following is a list of Standard Cherries suitable for marketing, to come in succession: Werder's Early Heart (a few), May Duke, Knight's Early Black, Elton, Bigarreau, Bigarreau Napoléon, Florence, Kentish or Flemish, Late Duke, Morello.‖—*E T C.* Taking into consideration the kinds of trees you have already planted against your south wall, we should recommend the following for your 55 yards of south-east aspect:—Barrington Peach, Impératrice Nectarine, Moorpark Apricot; May Duke, Knight's Early Black, and Elton Cherries; two Green-gage, Purple-gage, and Coe's Golden Drop Plums; Marie Louise, two Glout Morceau, Winter Nelis, Easter Beurré, and Beurré Rance Pears. We should recommend you to have studs instead of wire for training.‖—*A M G.* For a greenhouse where no fire is kept, excepting to exclude frost, you cannot do better than plant four Black Hamburgh and three Royal Muscadine.‖

Greenhouses: *A M.* Iron is so far better than wood that it is more durable, and much lighter; but it is dearer. Plants thrive under iron as well as under glass, in the hands of a gardener who knows his business; but we should doubt the propriety of using so costly a material for a purpose like that which you describe. A common plant shed, low, and with a glass roof made of rough steam-cut sash-bars, is quite sufficient.

Guano: *Sub.* It suits everything for which manures are useful; but unless the ground is very poor, it is safest not to use any manure for Potatoes.‡

Lime Trees: *X Y.* They are usually propagated by layers.‡

Melons: *Ignoramus.* The Beechwood.‡

Moss on Trees: *Z A.*—The best remedy is to scrape the roughest of the moss from the trees, and then wash them with a mixture of soap-suds, quick-lime, wood-ashes, and cow-dung; the root of the evil is bad drainage.‡

Names of Plants: *T W.* Peziza coccinea.—*M L.* Lastrea spinulosa, fertile and barren. *S.*—*J R.* Pteris aquilina, *L.* This is the form it assumes in the stove. *S.*—*H. d.* Not a Jossinia, but a new Diospyros (*D. amplexicaulis*). We have it in our herbarium from the Isle of France.—*B M.* Euphorbia nereifolia.—*R E.* After a long examination, we remain uncertain as to the genus of this plant. Its pollen masses are gone, and they are essential to the identification of doubtful Maxillarids.—*T D H.* Lælia erubescens.

Peach Trees: *J H J M.* You are, no doubt, correct in attributing the dropping of the buds to the borders being kept too dry. You will find an article on forcing Peaches in another column of to-day's Paper.‡

Pelargonium Leaves: *C C.* They are affected by the "spot," a disease which is believed to be caused by cold and damp.‡

Rain Water: *J L* It is practically a uniform composition. Any variation in this respect is owing to accidental circumstances. ‡

Rhododendrons: *S M.* It is the fault of such Rhododendrons that they bloom out of doors in winter; for, in severe weather, their flowers are always cut off by frost.‡

Ripening Wood: *J L.* The best and most economical mode of aiding the setting of blossoms and ripening of wood in bad climates or places, is—1, by thoroughly draining the border, and taking care that it is formed of light materials, able to absorb all the heat that is produced by summer suns; 2, by laying wood in thin; 3, by protecting the blossoms by canvas or woollen screens, or by Spruce Fir or Birch twigs interwoven among the branches. Air, sun, and drainage, are all in all. If however circumstances are so bad that air, sun, and drainage enough cannot be secured, then you had better have flued walls.

Sweetbriar: *S M J.* Make the fence at any time during the planting season. Set the plants alternately in a double row, a short distance, say 2 feet, apart; then when they begin to be shabby, cut down one row and leave the other. Afterwards reverse the operation. This is necessary in consequence of the shabbiness of Sweetbriar hedges. Put in Laurel cuttings under hand-glasses in April or August.

Verbenas, &c.: *Gardener.* 70° or 80° are much too warm for them.; 40° are ample.‡

Vines: *Old Sub.* It will not injure them to cover their roots with a temporary framework, provided the border in which they grow can be watered when it requires it. You had better not pave with bricks.‡

Water Butt: *Geo F Harris.* We are unacquainted with any means of removing the green Conferva which infests your water, without injuring the quality of the water itself. The most likely way would be to supply the tank with rain-water instead of the lime-water which you now receive. The seeds of the Conferva come with the water that passes through your iron pipes. If you can do what we advise, empty your tank and pitch the inside, if of wood; or give it a good coat of cement, if of stone or brickwork.

NATURAL GRASS SEEDS, FOR PERMANENT PASTURES, AND IRRIGATED OR CATCH MEADOW,
Which may be had Separate, or Mixed, expressly to suit the soil.

MESSRS. JOHN SUTTON AND SONS having for many years paid especial attention to the examination of Natural Pastures, and the collecting of various kinds of Grasses which grow naturally in the various soils of England and Wales, for the purpose of introducing an improved system of laying down land to permanent pasture, are thereby enabled to supply the sorts and quantity of Seeds best adapted to suit the soil for which they are intended; and *at much less expense* than is usually incurred.

JOHN SUTTON and SONS *are also extensive growers of Turnip, Carrot, Mangold Wurzel, and other Agricultural Seeds, which they sell at lowest market prices, carriage free, and which they can warrant new and true.*

Any particulars required respecting Grasses or other Seeds, will be promptly given to applications addressed to JOHN SUTTON and SONS, Seed Growers, Reading, Berks.

TRUE DRUMHEADS for CATTLE, also EARLY BATTERSEA, the large Imperial, Early Vanack, &c., at THOMAS WELLANDS, Surrey Gardens, near Godalming, Surrey, packed and delivered at the Godalming Station, 3*s.* 6*d.* per 1000; the large Asiatic Cauliflower Plants, 3*s.* per 100.

GLASS FOR CONSERVATORIES.
JAMES PHILLIPS AND Co. have the pleasure to hand their New List of Prices of GLASS for cash.

CUT TO SIZE.

16 oz. from 2*d.* to 3½*d.* per foot.
21 oz. ,, 3¾*d.* 5*d.* ,,
26 oz. ,, 3¾*d.* 7½*d.* ,,
32 oz. ,, 4*d.* 9½*d.* ,,

in Boxes of 100 feet, 8*s.* 6*d.* each.
4½ by 3 ... 5 by 2½ ... 6 by 2½ ... 6 by 3½ inches.
4½ by 3 ... 5 by 3 ... 6 by 3 ... 6½ by 3
4½ by 3½ ... 5½ by 3 ... 6½ by 3 ... 6½ by 3½

Larger Squares increase in price according to size. Every size kept ready packed in boxes, and may be had at a moment's notice.
Extra Crown, Sheet, and Patent Rough Plate Glass, cut to size for Conservatories, Greenhouses, &c.
Gardeners and others glazing on Mr. Paxton's plan can be supplied with Sash-bars of any length for the purpose.
PROPAGATING, CUCUMBERS, FERN, PEACH, and every description of Garden Glasses.
Bailiffs, Farmers, Dairymen, and others supplied with Lord Camoy's Milk Syphons, Milk Lactometers, Glass Milk Pans, Glass Tiles, Slates, &c., &c., for collections of which Messrs. COGAN and Co. were honoured with the Silver Medal of the Dublin Society, as also the Silver Medal of the Liverpool and Manchester Society held at Warrington in September last.
For Estimates, Prices, and further particulars, please address Messrs. COGAN and Co., 48, Leicester-square, London.
Glass Shades, Gas Glasses, White Lead, Colours, &c., as usual.

GLASS FOR CONSERVATORIES, &c.
HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.
See the *Gardeners' Chronicle* first Saturday in each month.

FARMS AT STANTON FITZWARREN, NEAR HIGHWORTH, WILTS.
And within about four miles of the Swindon and Shrivenham Stations, on the Line of the Great Western Railway.
TO BE LET BY TENDER, from MICHAELMAS, 1851,
PARSONAGE FARM, comprising a Farm-house and requisite Outbuildings, with

| | A. | R. | P. | |
|---|---|---|---|---|
| | 183 | 1 | 19 | of Arable Land, and |
| | 38 | 1 | 12 | of Meadow, Pasture, and Homestead. |
| Total | 221 | 2 | 31 | |

AKER'S FARM, comprising a Farm-house and requisite Outbuildings, with

| | A. | R. | P. | |
|---|---|---|---|---|
| | 225 | 3 | 32 | of Arable Land, and |
| | 75 | 0 | 28 | of Meadow, Pasture, and Homestead. |
| Total | 301 | 0 | 20 | |

HUNTER'S FARM, with a Farm-house and Outbuildings, and

| | A. | R. | P. | |
|---|---|---|---|---|
| | 50 | 2 | 37 | of Arable Land, and |
| | 53 | 1 | 29 | of Meadow, Pasture, and Homestead. |
| Total | 104 | 0 | 26 | |

MATTHEW'S FARM, with a Farm-house and Outbuildings, and

| | A. | R. | P. | |
|---|---|---|---|---|
| | 18 | 3 | 10 | of Arable, and |
| | 57 | 3 | 30 | of Meadow, Pasture, and Homestead. |
| Total | 76 | 3 | 0 | |

To view the Farms, and for further particulars, apply at Stanton House, near Highworth, Wilts. Sealed Tenders to be sent, addressed to the Rev. J. A. TREECHARD, at the same place, on or before the 25th March next.
February 22.

FLAX AND FLAX COTTON.
FARMERS, Manufacturers, Unions, and Parishes, desirous of taking Licenses for preparing Flax on the economical and expeditious process of Chevalier CLAUSSEN, may now apply to Mr. J. S. CHRISTOPHER, 26, Gresham-street, London.

ARTIFICIAL MANURES.—PRIVATE INSTRUCTIONS in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.
Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | | |
|---|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.
N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 10*s.* per ton; and for 5 tons or more, 9*l.* 5*s.* per ton in dock. Sulphate of Ammonia, &c.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9*l.* 10*s.* per ton, or 9*l.* 5*s.* in quantities of 5 tons and upwards.
EDWARD PURSER, Secretary.
40, Bridge-street, Blackfriars, London.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.
Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, Esq., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.

**The Agricultural Gazette.**
*SATURDAY, FEBRUARY* 22, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
WEDNESDAY, Feb. 26—Agricultural Society of England.
THURSDAY, — 27—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, March 5—Agricultural Society of England.
THURSDAY, — 6—Agricultural Imp. Soc. of Ireland.

"TO MAKE TWO BLADES OF GRASS GROW WHERE ONE ONLY GREW BEFORE," has long been a favourite problem in England; and as Mr. MECHI lately observed in our columns, "To raise 120 acres of good Swede Turnips and Mangold Wurzel on an adhesive clay soil which never produced them before, is quite a triumph." There are three points noticed by Mr. MECHI as involved in the successful issue of this problem—the drainage of the soil, its aeration, and the rotting of vegetable matter within it. The two first are necessarily connected. The removal of water from the soil by drainage admits air; thus, both increasing its fertility and reducing the expense of cultivation. Trenching, again, both aerates the soil and promotes drainage, by opening and permitting a freer passage for the water through it. And the third point, the rotting of weeds, is the conversion of the greatest enemy of the farmer into his greatest friend. We might dwell at length upon the theories involved in these points, but we choose at present rather to deal with facts similar to those brought before us by Mr. MECHI; for in the United Kingdom we have still a large extent of adhesive clays, and even soils more easily worked, both of which are either under profitless culture, or under pasture of the most worthless kind; and to raise a good crop of Swede Turnips and Mangold Wurzel on them is one of the most important problems presented to British agriculture.

In corroboration of the practice pursued by Earl FORTESCUE, in the moist climate of Devon, as reported by Mr. MECHI, a correspondent mentions a similar practice pursued by his Grace the Duke of MANCHESTER, both in the equally moist climate of Ireland and in the drier neighbourhood of Kimbolton, Huntingdonshire. Both in England and the sister country his Grace was equally successful, the practice proving itself, in both examples, very much superior to several other methods of breaking up Grass land—such as paring and burning, ploughing up the rough sward, digging one spit deep, &c. But although, being dependent upon the same theories—those of draining, aeration, and decomposition of vegetable matter—the examples of the two noblemen correspond, yet their practices differ materially in detail, for the latter trenched the whole of the soil to the depth of 20 inches, turning the top spit to the bottom, and the bottom spit to the top, thus leaving a flat surface for the Turnips to be sown upon, with a soil equally loosened throughout; whereas, according to the system of the former, two years are required to loosen the whole of the soil, the Turnip growing on the undug sward the first year like a Potato on the lazy-bed of an Irishman's conacre. It is only when the lazy-bed, as an Irishman would call it, or the terrace of Mr. MECHI is reversed the second year, and the whole of the soil loosened, that Lord FORTESCUE's system is completed.

In Ireland the soil drained and trenched by the Duke of MANCHESTER was of three kinds, clay, gravelly clay, and a gravelly soil without clay, the latter two being full of stones, but fertile when relieved of water, and the whole incumbent on the shale and rock of the greywacké formation. Previously it was under different management, part being under Grass, part young wood, and part under the plough. The Grass was worthless, the young trees were choked with weeds, and the whole drowned in water. Draining and trenching preceded a fallow crop, doing away with the necessity of ploughings and cross ploughings, a double stroke of the harrows being all that was necessary prior to putting in the seed over the rotting turf below. The Turnip seed, a hybrid yellow, was sown on artificial manures of different kinds, but principally on bones along with a few ashes to start the plants, and the result was about 20 tons of bulbs per acre from the heavy clay, and 30 tons from the best gravelly Turnip soil. The trenching was done by task-work, and cost 3*l.* 4*s.* per acre, exclusive of 4*d.* for every ton of stones the labourer threw to the surface. The stones were measured in the drains, the quantity required to fill a perch, when broken, having been previously weighed, to satisfy parties. The lands subject to cultivation had little vegetable matter in them to rot, and after being drained and trenched were manured from the farm-yard, and cropped with Potatoes in drills, part being limed and part not. The difference of crop in favour of liming deserves special consideration, for the lands limed yielded 17 tons of Cups per Irish acre, while those not limed only yielded 10. The lands were in separate fields, but almost adjoining each other; and although the former were a degree better than the latter, yet the difference of quality was by no means sufficient to account for such a difference of crop. The crop was that of 1844, and the beneficial effects of lime were manifest.

In Huntingdonshire paring and burning was the fashion, so to speak; and with the exception of a few acres in the park, which were trenched as above, and planted with young trees, it was not departed from at Kimbolton. Liberty was given to the labourers to grow Potatoes, Peas, Carrots, &c., in the young plantation the first season, and the crops grown were very much superior to those grown after paring and burning, the difference being more than sufficient to cover the difference of expense. Indeed about 60 acres, which were sown with Turnips in 1846, cost as much between paring, burning, ploughing, harrowing, clod-crushing, &c., as would have trenched them, so that, in this case it would appear that rotting the sod is a superior practice to burning it, and more easily effected.

"Paring and burning," according to our correspondent, "has never been a popular practice, generally speaking, among farmers, and with the progress of science is daily becoming less so. The results arising from it are not only temporary, but fallacious, never yielding in corn according to appearance as of straw, while the opposite are obtained from the rotting system. Many pare and burn, not of choice, but of necessity, the practice being merely adopted as the least of two evils; but now that draining is becoming better understood, the practice of rotting, which could not successfully be adopted without it, will doubtless gain ground and supersede that of burning."

We would remark on this, that while the theory of the process condemns it as wasteful wherever much vegetable matter is present in the substance burned, yet that the question of economy when put to the farmer has always to be answered relatively to the means at his command—and that very often this is the cheapest process within his reach for reducing the tough material which he has to bring to a tilth. The subject of burning clay soils depends of course upon altogether different considerations from that of paring and burning Grass lands; and theory here commends the practice.

The moist climates of Devon and Armagh, with many others in the kingdom, are favourable to the rotting system, but even in the drier climate of Huntingdon and others, if the soil is got drained and trenched in time the process of rotting will be pretty well advanced before the scorching months of July and August set in. If once it has got to a certain stage it will imbibe moisture from the atmosphere to supply the young plants during the drought of summer. Much, however, depends upon the mode in which the work has been effected. If carelessly

trenched, without any regard to the rotting of the turf, and the getting of a proper tilth above it, the practice may not only turn out a failure, but that failure may be fallaciously imputed to the turning up of unsound subsoil to the surface. On the contrary, if carefully executed, and early enough in the season to benefit by sun, rain, and frost, it will be otherwise; for under such circumstances lands trenched suffer less from drought than those not trenched.

Many still entertain strong prejudices to turning up the subsoil to the surface, and no doubt great caution is necessary before such a work is begun; but with proper drainage, effected in the previous year, much less is to be apprehended from it than under the old system, when trenching resulted only in the stagnation of a greater quantity of water in the soil, reducing the whole to something worse than the subsoil quality. Sometimes the subsoil is even more fertile than the surface; and when spread over it produces better crops, both as to quantity and quality. The rain tends to wash much fertile matter out of the soil downwards, to where, under shallow cultivation, it is useless. In short, shallow culture is incompatible with successful husbandry, especially the cultivation of Turnips.

There cannot be a doubt, we think, that when the means of the cultivator and his time admit of it, the plan of trenching the soil, as pursued by the Duke of Manchester, is the best mode of breaking up tolerably deep soils in sward.

And we are glad to have the opportunity of thus describing the successful issue of the practice in so many instances, under such a variety of circumstances.

---

"What an uncommonly mild season have we had?" is the remark of every one. Winter seems to have lost its place amongst the seasons. The pastures have been clothed with the verdure of spring, and vegetation, roused to activity, may, in some instances, be ill-prepared to withstand the extremes of the early spring months.

The contrast which the rigours of one season present to the mildness of another, furnishes matter for pleasing reflection to many, and recondite speculation to not a few. A mild moist winter was anticipated by some as a compensation for the dry and unusually fine autumn which had preceded it. It is very probable that there is some general connection between the two, although the special or local phenomena will ever be entirely beyond our foresight. Some, who seem to have no taste or patience for unravelling the complex processes, which act and react on each other, in the minuter changes of the weather, study the subject under the two grand divisions—fair and foul—and endeavour to link the great deviations from the mean or average with certain conjunctions and positions of the planetary orbs towards each other and the earth, which they imagine have the effect of upsetting the equilibrium of our aerial ocean. The phases of our satellite have also long been held in respectful awe by the weather-wise; but it is very generally admitted that this and all other signs fail to instruct us.

It is a somewhat prevalent opinion that cultivation has considerable influence in mitigating the rigours of our winters, and giving us warmer summers. Each and every one of these theorists will freely give examples as illustrations of the truth of their positions. This circumstance alone ought to make us extremely cautious of applying isolated meteorological figures, when attempting to trace the relation of one phenomenon with another, and especially when we are solving practical questions, when there are so many conditions to be taken into account.

What effect has the improved operations of modern agriculture had upon our climate? To discuss the special action of these agencies would, in the meantime, be out of place. A few only will be alluded to. Any country drained and cleared of wood will, undoubtedly, have its summers hotter; the one operation saves the expenditure of the heat, in evaporating the water which falls from the heavens; the other accomplishes a somewhat analogous effect, for vegetation in active growth is a powerful absorbent of solar heat, much of it being rendered latent during the mysterious processes of assimilation; but a bare dry soil is soon heated, and deprived of its moisture. Some tracts in Mexico have been rendered comparatively barren, through the destruction of its forests by its first conquerors from the old world. A country cleared of wood permits other agents to come into play, or act with greater intensity, which thus may have a larger share in producing changes in the capabilities of its soil, for raising certain crops, than the slight differences in meteorological figures, owing to this clearance, would lead us to expect. Thus an overwooded estate, in a moist climate, renders it totally unfit for the cultivation of cereal crops, however well its climatic conditions may be suitable in other respects. But moisture, fogs, and clouds, keep us warm in winter, and dry land sooner cools from frosts than when wet, as water in the act of congelation gives out a large amount of latent heat. Dry air and cold air are almost synonymous terms in winter. Cultivation will therefore rather have a tendency to increase the winter's cold.

In regard to the influence of cultivation in effecting changes in the character of the season in the British Islands, we think it admits of considerable doubt, in so far at least as to make it appreciable to our instruments. From its insular position it is, perhaps, less susceptible of these effects—our observations are by far too inaccurate to serve our purpose; and besides we do not know how far the extremes vibrate on either side of the means. One day varies from another, and there were never two exactly alike. The same may be said of weeks, months, and years; but in almost every season there appear certain characteristics which it assumes and maintains. The ameliorating agencies of cultivation have, however, far more to do with the "terrestrial" climate than with the atmospheric. Over the great forces of the air man has no control; they will act quite independent of him, and the winds will ever blow where they list. Extreme seasons of mildness and rigour do not fall out by accident, but, on the contrary, their concomitants are numerous and striking. The south-west winds laden with moisture have not only given us an open season, but they have penetrated into Western Europe, which has also shared their heat and moisture; but the western seaboard of North America appears to have got their own share of winter's cold and ours also. In Britain the temperature of January varies more than of any other month in the year; this is determined by the currents of wind, whether they may blow from the expanse of sea to the west, or from the wide extent of continent on the north and east. The temperature and directions of the winds for the two following years are good examples of their effects:

1834, Jan., mean temperature 45.40.
Days of wind, 1 N., 0 N.E., 1 E., 0 S.E., 9 S., 11 S.W., 6 W., 3 N.W.

1838, Jan., mean temperatare 27.79.
Days of wind, 5 N., 11 N.E., 5 E., 3 S.E., 4 S., 1 S.W., 0 W., 2 N.W.

The character of our seasons is entirely dependent on the directions in which the winds may settle, but they produce opposite effects in summer and winter—for in the former the moisture of the south-west winds obscures the sky with clouds, and prevents the sun from heating the earth and lower strata of the atmosphere. Drought and heat generally go together in summer, and dry air and cold weather are still more inseparable in winter.

Those who study the language of the heavens find a certain consistency and constancy in the mode in which the contingencies of the weather are worked out—order and method are observed which the philosopher and the poet attempt to trace; the one through the cold material laws of nature, the other intuitively, or by inspiration. The southerly and northerly winds, especially in winter and autumn, seem to prying man to be joined and knit to each other, apparently in artful perplexity; the two are ever ready, at each other's call, to wage a keen conflict, in which the one tries to undo the other; instead of growing weary with their continual strivings, they rather appear to glory in each other's strength. True, the relaxing breezes from the warm south have rather had the upper hand of their northern antagonist this winter, and have mixed the warmth of April with the moisture of November in mid-winter. But are the two to be looked upon as one grand whole performing wheeling gyres in its progress towards the polar circles, there to be robbed of the watery treasures, which are evidently one of the main elements of discord? The philosopher of late replies in the affirmative. The rotary theory of storms has, however, always appeared an enigma to us, though the following lines certainly do inspire a certain respect for it. How beautifully and truthfully is the circuit of the winds, in our mild winters, expressed by frolicsome Mercutio. Who would have thought there was such philosophy in him?

> "What more inconstant than the wind, who wooes,
> Even now, the frozen bosom of the north;
> That being angered, puffs away from thence,
> Turning his face to the dew-dropping south."

*R.*

---

## SCHEME OF CULTIVATION FOR SMALL FARMS.

The farm consists of 110 acres of light land, 16 acres of which are water meadow, and 10 permanent Grass land. The mode of cropping deemed advisable, the implements and stock required, and the capital needed, are all desired. We shall assume that markets are so situated that the green crops must all be converted into beef, and we shall suppose that the land is good deep Barley soil, worth 30*s.* an acre.

1. *Course of cropping.*—84 acres of arable land will divide into 6 fields of 14 acres each; and the soil will allow of the following rotation.

1. Wheat, with Rye sown in autumn.
2. Rye and Swedes.
3. Barley, with Grass and Clover seeds.
4. Clover.
5. Wheat.
6. Carrots and Mangold Wurzel.

The produce will be.

140 tons of Rye.
240 ,, Swedish Turnips.
120 ,, Clover.
100 ,, Carrots.
200 ,, Mangold Wurzel.

800 tons of green food from the arable land.

And 100 tons of Grass from the pasture land, and 300 from the water meadow, making 400 tons of Grass, of which we may suppose 200 to be made into 50 tons of hay. There will then be for winter consumption 50 tons of hay, and 540 tons of roots, and for summer consumption 140 tons of Rye, and 320 tons of Clover and Grass. About 18 tons of green food per week for them in summer, and 20 tons of green food, with nearly two tons of hay a week for them in winter; and the same stock which would consume the former in summer time, would consume the latter in winter. You will then be able to keep about 25 oxen, besides a pair of horses, summer and winter, selling them in March, April and May, to weigh 7 cwt. or 7½ cwt. apiece.

2. *Stock.*—Perhaps the best plan of consuming this by stock would be to purchase two-year-old oxen in May and June, feeding them on the Rye at first, and grazing them in the Clover and pasture fields during summer, and bringing them in for consuming the hay and roots in winter.

3. *Labour.*—One pair of horses is enough to manage the land, if you employ a little extra manual labour on the headlands of fields and so on, leaving the horses to do only the main portion of the work. If there be any difficulty about the horses getting over their work, you might dig the Wheat stubble for Carrots. The labour need not amount to more than 2*l.* 10*s.* per acre over the land.

4. *Implements needed.*

| | | |
|---|---|---|
| One plough, 4*l.*; two harrows, 5*l.*; one roller, 8*l.*; scarifier, 10*l.*; two carts, 20*l.*; Bean-machine, chaff-cutter, &c., 50*l.*; feeding, horse and stable apparatus, harness, &c., 20*l.*; total, 117*l.* | | |

5. *Capital.*

| | | | |
|---|---|---|---|
| *Stock*— 2 horses ... ... ... ... | £60 0 0 | | |
| 25 oxen ... ... ... ... | 250 0 0 | | |
| | | £310 | 0 0 |
| *Labour*—110 acres, at 50*s.* ... ... ... | £275 0 0 | | |
| *Food for horses*—50 sacks of Oats ... | 20 0 0 | | |
| | | 295 | 0 0 |
| *Implements* ... ... ... ... ... ... ... | | 117 | 0 0 |
| *Seed*—Wheat, Barley, Clover, Swedes, &c. ... ... | | 45 | 0 0 |
| *Rent and Taxes*—110 acres, at 30*s.*, for rent alone ... | | 247 | 0 0 |
| | | £1014 | 0 0 |

6. *Balance Sheet for the year.*

| | | | |
|---|---|---|---|
| *Received*—for 25 oxen, 7½ cwt., at 5*d.* per lb. ... ... ... | £437 10 0 | | |
| For 28 acres of Wheat, at 36 bushels, at 5*s.* 6*d.* per bush. | 277 4 0 | | |
| For 14 acres of Barley, at 52 bushels, at 3*s.* 6*d.* per bush. | 127 8 0 | | |
| | | £842 | 2 0 |
| *Paid*—Stock ... ... ... ... ... | £250 0 0 | | |
| Labour ... ... ... ... | 295 0 0 | | |
| Seed ... ... ... ... ... | 45 0 0 | | |
| Rent ... ... ... ... ... | 247 0 0 | | |
| Depreciation in value of implements and horses, 10 per cent. on 117*l.* ... ... ... .. | 11 14 0 | | |
| | | £848 | 14 0 |

This lands you in a loss on the year's proceedings; but having arrived at this result, weighing each step in the process as well as I could while taking it, I do not see that I am at liberty, because of the unfortunate result at which I have arrived, to remodel the different parts of the scheme. Nevertheless, I may state for your encouragement, that it is quite possible to keep one-half more stock than I have named, by careful management, by taking "stolen" crops, such as Mustard, Rape, &c., capable of growing between corn harvest and the spring seed time, and by purchasing cheap cattle food, such as Linseed, and consuming your straw. *M. S.*

---

## Home Correspondence.

*Liquid Manure.*—I wish to call your attention to a remark contained in a speech made by Dr. Anderson, at a recent meeting of the Highland and Agricultural Society, as reported in your paper of the 1st inst., and to request your opinion as to its correctness. Dr. Anderson says, "It ought to be remembered that the amount of ammonia in liquid manure was very small, and that in phosphates it was entirely deficient (!), so that it could never be relied on alone; but must be conjoined with a certain proportion of the solid manure." Now this appears to me to be a very important question, and one well deserving your attention and consideration. I have certainly always considered liquid manure to be deficient in anything like a store of ammonia, but I certainly supposed it was especially valuable on account of the phosphates and other salts that it contained; and if I am altogether wrong in this respect, I should much like to know to what the very striking effect of a few repeated applications of liquid manure, even when considerably diluted, is owing. For, although it may be questionable whether it will answer to apply it, on a

large scale, by any very expensive system of pipes, or carts, or such like, there can, I think, be no doubt of its well repaying the cost of its application, in a more simple and inexpensive way; such, for instance, as by means of irrigation, when much diluted, or by mixing it with dry mould, marl, ashes, or other convenient substance, if it be tolerably free from water. *W. M. H., Bashley, Lymington.*

*Poultry.*—Observing in your valuable Paper of Feb. 1st last that one of your correspondents is anxious to know how he may mark his poultry, I take leave to suggest a system which I have followed for some years to my satisfaction. It is simply as soon as the chicken is hatched to remove with a sharp pair of scissors the hind claw on the right or left foot, which in no way injures or retards the growth of the chicken. I keep a hundred head of poultry for the sake of the eggs only; and as it is of importance to me to know the age of my hens, which I never keep beyond the third year as layers, I find this system of marking exceedingly useful. My plan is to take off the hind claw on the right foot of those hatched (we will say) in 1851; the hind claw of those on the left foot will have to be removed from those hatched in 1852, and in 1853 it will not be necessary for me to make any mark.

EXAMPLE:

| HATCHED. | LAYING. | SOLD OFF. |
|---|---|---|
| 1851, Hind claw right foot... | 1852, 1853, 1854... | Christmas of 1855. |
| 1852, Hind claw left foot | ...1853, 1854, 1855... | ,, 1856. |
| 1853, No claw taken off | ...1854. 1855, 1856... | ,, 1857. |
| 1854, Hind claw right foot... | 1855, 1856, 1857... | ,, 1858. |

*A Subscriber, Midland Counties.*

*Drainage Acts and Drainage.*—The article entitled "Drainage under the Act," in the *Gazette* of the 25th ultimo, evinces the practical knowledge of the writer both as to the mode of execution and the effect which good drainage should produce, and is deserving the careful perusal of all who contemplate the drainage of their estates, whether done under the Acts or not. One would fain believe the impression erroneous respecting the compulsory adoption of deep and distant drains under all circumstances; for I can affirm that no such instructions, direct or implied, have ever been given to myself. My Reports to the Board have invariably advised the execution of the several works at such various depths and distances as were best suited to the character of the respective subsoils; and in no case have I been called upon to reconsider the plan proposed. With two or three trifling exceptions, however, I certainly have never been permitted to carry to completion the systems recommended in those Reports, but whether this is indicative of the accuracy of the surmises that "some pet plan to which the inspector or others in office may have committed themselves," is expected to be enforced, I know not. If it be, I am content to wait until, as in the instance given, results work conviction of the error. Facts are irresistible by ingenuous minds, and even the dogmatical teaching in this respect of the deservedly admired Drainage Essay of the *Quarterly*, must give way before them. If the standard of excellence be, as most will allow, complete and permanent effect at the least cost, then must depth and distance be regulated by the requirements of each case; but if efficiency is to be secured irrespective of cost, then may 4, 5, and even 6 feet drains be cut in all land, care only being taken to put them near enough. The principle, however, upon which the universal application of the deep and distant system became fashionable was, that extra depth compensated for wider intervals, and hence that an equally effectual result was obtained at a less cost. It is impossible, with daily evidence of the contrary, to concur in the opinion that landowners and their agents practically know more about the qualities and capabilities of the soils of their estates than strangers do, and particularly as regards the operation of drainage. An inspector under the Drainage Acts in Scotland has just favoured me with a communication, in which he remarks, "I certainly think that no applicant I have had to deal with has any right to complain of the expenses of the working of the Act; for many of them, as well as all the people on their estates, were so thoroughly ignorant of what good drainage was, that they would have wasted most of their money if the inspectors had not interposed and shown how it should be done." And it will be equally evident to all who will take the trouble to read the Acts, that the legislature were as fully sensible of the same fact, and consequently provided for the drainage being properly done under the supervision of inspectors selected for their knowledge of the subject. My Scotch correspondent, in reference to the necessity for seeing the drainage during its progress, in order to be satisfied of its proper execution, says, "I have sometimes been rather puzzled and doubtful how to act when I have been called upon to inspect and pass extensive drainage works when I had not been called in to see them when being executed. I quite agree with you that there ought to be an intermediate inspection while the works are in progress. It is a delicate thing, however, to propose an inspection without being called in or sent for, as it may be said or thought that we are acting for our own pecuniary interests, and wishing to make a job of the business." Feeling the necessity of definite directions on this essential point, I wrote, about two years ago, to the board especially on the subject; for from the general instructions we had received, it appeared to me that we had no power to make intermediate inspections, or indeed any inspections, without direct instructions to do so. Our general instructions say, "it will be desirable that you should ascertain under whose superintendence and direction the applicant for the advance intends to place the execution of his works, and that you should satisfy yourself, as far as practicable, as to the extent of the fitness and trustworthiness of that individual, in order that the commissioners may be enabled to decide what amount, if any, of occasional inspection will be requisite during the progress of the works." Clearly, then, this point was exclusively for the board to deal with; but no answer was ever given to my letter, and the matter remains, as we see, in the same unsettled and unsatisfactory position. Now all this difficulty and jealousy about the assistant commissioner's charges might be at once obviated by paying them annual salaries proportionate to their respective districts or on some other suitable basis. I do not suppose that were this done our demands would be unreasonable; but on the contrary, it is very probable that, on the ground of certainty, we should be ready to accept very moderate remuneration, and such at least as should be commensurate with the times. There would then only remain actual expenses to be charged for—the salary being apportioned to each applicant along with the other official charges. It would not be necessary to stipulate for exclusive service, but for the diligent and efficient discharge of the duties of his office whenever required, and without delay. In conclusion, I cannot refrain from briefly directing the attention of the landed interest to no less than three instances of the misapplication of deep and distant drainage which have been made public within the last fortnight, and which, for their edification and government, are worth all the theory that has been written on draining since the time of the flood; or rather, which confirm the soundness of the theory that forewarned them of such results. The first instance is that which your correspondent of the 25th ult. details, and which is of the greater value from being a special experiment, having the deep work "executed precisely in accordance with the inspector's directions," and having also his admission on subsequent inspection that the 3 acres so drained "were scarcely benefited at all." The second instance is that recorded in the *Times* of the 28th ult. by their commissioner in his report on the agriculture of Cumberland. Speaking of the drainage which had been done on Lord Lonsdale's estates, and the necessity of providing in the drainage of that district for the percolation of a very much larger amount of annual rain-fall than occurs in other parts of England, says "it can never be safe to act altogether in defiance of local experience until we have had time to mature our own; and accordingly further experience has shown that very wide intervals and excessive depth will not do for the soil of Cumberland. Four feet deep and 7 to 10 yards apart are now the standard on Lord Lonsdale's estate; an additional drain having been in many fields put in between the wide intervals which were at first unsuccessfully adopted." I am told also of another instance in this county, where the same additional drains have been put in to remedy the defective results of the first execution. The third instance is one rather deducible by inference than from a statement of the fact itself, but is to my judgment little less conclusive. The testimony alluded to is that given by Mr. Mechi in last week's *Gazette* in his "Trip to North Devon," where he says, "Another great mistake is the recommendation to lay such heavy land on the flat;" that is, when thoroughly drained. If to lay such land flat be a mistake, it is only so by reason of its drainage not being effective, and hence that probably there is in this case also a misapplication of depth and distance. But on this subject of laying drained land flat, I purpose shortly to avail myself of Mr. Mechi's invitation to discuss this question of open furrows, which is one of no inconsiderable interest and importance as affecting the efficiency of proper drainage. *John H. Charnock, an Assistant Commissioner under the Act, Wakefield, Feb. 3.*

## Societies.

### ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

### CULTIVATION OF FLAX.

(*Continued from p. 109.*)

SIR JAMES GRAHAM enquired of M. Claussen, whether the farmer, in separating the seed from the straw, would be liable to injure the fibre: to which M. Claussen replied, that no such injury to the fibre would arise from any of the present modes of separating the seed from the straw, so long as the separation is made longitudinally; that an ordinary threshing-machine might be so employed as not to injure the fibre: in fact, that the only injury that could arise would ensue from breaking the fibre across, or steeping it on the old system.—The Chairman thought it desirable that no time should be lost in putting the farmer in possession of all the conditions under which Flax could be grown advantageously, and conveyed to market at a profit, as the time for sowing the crop was near at hand.—Mr. Alcock, M.P., stated that coals could be brought from Yorkshire at 7*s.* 6*d.* per ton, but they were a compact heavy article of transit, while Flax would be bulky and light.—Mr. M'Dermott observed, that the bulk of the Flax might be reduced (without license) by partial removal of the straw by a machine that would cost 10*l.*, and also by hydraulic pressure, as in the case of hay for exportation, and that the railways might eventually contract at lower rates for the conveyance of this new branch of traffic.—Mr. Majendie thought if the machine was portable, it might be let out from farm to farm. If the Claussen process did not produce any injurious effect on Flax that rendered it unfit, in any degree, for subsequent use in all the ordinary stages of manufacture, it would prove of great benefit to the country.—Mr. Christopher, M.P., and Col. Challoner, thought it desirable that the cost of machinery required by farmers for commencing this branch of cultivation, so new to many of them should be accurately ascertained.—Mr. Miles, M.P., had been just endeavouring to obtain that information from one of M. Claussen's friends near him, and it appeared that one machine only was essential, but that two might, for further preparation of the Flax, be employed, if the former thought proper; the first machine cost 10*l.*, and the object of it was to separate the fibre for the manufacturer, and to leave the shoves or gross remaining matter, amounting to two-thirds of the original Flax, behind it, to be returned by the former to the land; the second machine would cost 50*l.*, and was adapted for clearing the fibres effectually from the refuse after the first chemical process.—The Hon. Dudley Pelham, M.P., conceived it important to inquire into the effect that the introduction of this new system would have on the relative employment of labourers in Flax culture and its operations.—Mr. Kennedy inquired the price of new British cotton compared with that of the ordinary foreign cotton, and was informed that it was from 4*d.* to 6*d.* per lb, while the foreign cotton ranges from 8*d.* upwards, according to quality.—Mr. Fisher Hobbs informed the Council of the result attending Flax cultivation in the eastern counties, where the growers were unable to obtain a market for their produce. The farmer's capital was, he thought, too nearly exhausted at the present moment to render it prudent for him to embark in any new line of cultivation, without being first well assured that after having overcome all the practical difficulties of a new crop, and its preparation for sale, he should find a ready market for its disposal. He hoped, as in the case of wool, that there would be a probability of farmers having a Flax-market, so that the article might be taken off their hands at so much per acre or ton, without loss or risk of their capital employed. Seeing among them that day a member of the distinguished family of the Leeds Flax spinners, he would appeal to him on this point, in the hope that he would be able, from experience of the whole question, to favour them with an opinion on the subject.—Colonel Challoner then ascertained, by inquiries addressed to M. Claussen, that Flax injured by the farmer for sale and use under the old system, was available and equivalent to uninjured Flax for the purposes of M. Claussen, who would give as good a price for it.—Mr. Marshall, M.P., replied to Mr. Fisher Hobbs, that while his brothers were the Flax spinners, he was only, to a limited extent, a grower of that crop for their use. They were, he believed, in the habit of paying 7*l.* or 8*l.* per acre for the use of land for the Flax crop, they bearing all the expenses of cultivation, while the farmer had the benefit of the land for the remainder of the year. There was at the present time a market for Flax. In Belgium the "fabricant" relieved the grower of all trouble and responsibility attending his crop, visiting his farm in person and taking it at a valuation. On the old principle, the object had been to obtain long fibre; a mixture of which in the warp with cotton in the weft was stronger than cotton, and more durable in wear, being employed for sheeting and shirts. On the new principle, the Flax is broken up into short instead of long fibre; and instead of steeping in hot or cold water, chemical means were employed to facilitate the process without injury to the material. If land is clean and in good order, Flax may be grown without manure. But the farmer cannot do two things; he could not under the present system, and for the present market, both grow it and prepare it for the manufacturer. With regard to thick and thin sowing, that question had reference to the object of the cultivator, namely, whether a fine fibre and little seed were required, or a coarser fibre with a full crop of seed. On the banks of the Lys, in Belgium, where the finest Flax had been grown for centuries, and used for making the finest lace, they practised thick sowing, 3½ bushels per acre, and obtained about 14 bushels of seed per acre; but the stems were long and straight, without branches, and the longest fibre was obtained. In Ireland and Russia thin sowing was practised, from 2 to 2½ bushels per acre, and from 16 to 20 bushels of seed were obtained; but the stems of Flax branched out more, and an inferior fibre was the result. It would be the safest plan for beginners in this country to sow thin, and thus get more linseed and straw. He concluded by remarking that if M. Claussen succeeded in his laudable endeavours, so much the better would it be for the farmers of this country.—Mr. Macartney thought that the average growth of Flax in Ireland had not fallen off. He referred to Lord Clarendon's liberal aid in promoting its cultivation in that part of the United Kingdom, to the mode in which the factors purchased the crops, to the cost of conveyance, and to Schenck's improvement in steeping.—Mr. Hamond had grown Flax in Norfolk, but finding no market for his produce he had sent his Flax to be manufactured into linen for his own shirts. He had also had several of the cottages on his estate thatched with the straw, and more beautiful thatch he never saw.—Mr. Fuller, M.P., had also grown Flax, in Sussex, but he had no better success in getting it off his hands; and when he offered it to a large manufacturing house, he was told that they could only give him linen in return for it.—Mr. Shelley remarked, that there was no difficulty in farmers growing Flax, the only difficulty was to get a market for it. In Sussex it could not be turned into money. If M. Claussen could make it

marketable for them, he would find no want of growers. It was, he thought, of little purpose to tell farmers of the quantity grown and the price it ought to fetch.—M. Claussen replied, that it was both simple and easy to prepare the Flax for the spindle, and he would undertake to furnish persons properly instructed who would direct the farmers how to proceed. There was one house at Bradford, that of Messrs. Quitzow, Schlesinger, and Co., Flax-spinners, dyers, and merchants, whose only fear was that enough Flax would not be grown for their use; and they were, he believed, ready to give 4*l.* per ton for Flax of fair quality.—Professor Way observed that the present system of preparing Flax only applied to existing markets. M. Claussen's method, as he understood it, had the merit of opening new and extensive markets for this article; and there was one important point in the new plan—that there would in future be no distinction of Flax into fine or coarse qualities. The farmer, too, under the new system, would not be obliged to pull his Flax, as under the system hitherto in use, before it was ripe, in order to secure a higher price for his fibre; but, on the contrary, it will not be necessary to pull it until the seed and stalk were fully ripe. The farmer would thus obtain a larger proportion of fibre in proportion to the bulk, and a heavier crop of seed. He understood the quality of fibre in the new process not to be so essentially of importance as under the former plan, and that farmers may break the Flax to reduce its bulk. The new material would be intermediate between linen and cotton; less valuable than the one, but more valuable than the other.

Mr. Shelley then rose to propose a vote of thanks to M. Claussen for the favour he had done them in his attendance on the occasion, and the information he had laid before the Council. He heartily wished him success in the practical development of his discovery, and hoped that the farmers would reap the benefit of it, and obtain a fair remuneration for their produce.

Mr. Miles, M.P., seconded the motion. Kind, indeed, it had been of M. Claussen to come before them that day, before he had completely secured his patent, to give them the earliest notification of the agricultural bearing of his researches. He trusted that the result would prove as good for himself as for the farmers, whose interests he had then advocated.

The Chairman then put the vote, which was carried unanimously. He was sure they all felt deeply obliged to the Chevalier Claussen for the favour he had done them. The information had been fully submitted to their consideration, but of course they received it without any inference being drawn from such reception that the Council held themselves responsible in any degree for the opinions expressed by M. Claussen. He thought it his duty, as their chairman, to repeat this caution. On that day fortnight, namely on Wednesday, the 26th of February, at noon, M. Claussen had consented to again attend, for the purpose of detailing, after the completion of his specifications, the details connected with his new process. Mr. Beale Browne would probably on the same day bring forward the statement, of which he had given notice, of his long experience in the cultivation of Flax.

---

A Weekly Council was held at the Society's House, in Hanover-square, on Wednesday last, the 19th of February: present, his Grace the Duke of Richmond, K.G., President, in the chair, Sir Charles Lemon, Bart., M.P., Sir John V. B. Johnstone, Bart. M.P., Mr. Raymond Barker, Mr. Burke, Mr. D. Burton, jun., Dr. Calvert, Mr. W. Clavering, Mr. Gadesden, Mr. Leveson Gower, Mr. Jacson, Mr. Majendie, Mr. C. E. Overman, Mr. Sanford (Ninehead-court), Professor Sewell, Professor Simonds, Mr. Stansfield, M.P., Mr. R. Thompson, Professor Way, and Mr. Wilson (Stowlangtoft).

The following new members were elected:

Erle, the Hon. Sir William, Knt., one of her Majesty's Judges of the Court of Queen's Bench, Park Crescent, Regent's Park, and Bramshot Grange, Hampshire.
Helyar, William Hawker, Coker Court, Yeovil, Somersetshire.
Gonne, Charles, Warley Lodge, Brentwood, Essex.
Peacocke, Warren, Tanhurst, Dorking, Surrey.
Garrad, Abraham, Colchester, Essex.
Collins, George B., St. Colomb, Cornwall.
Charlesworth, John Barff, 158, New Bond-street, London.

The names of 4 candidates for election at the next meeting were then read.

Phosphorite.—The President made an interesting statement to the meeting on the subject of native phosphate of lime, and the probability of its occurrence among the metaphoric masses in this country. His Grace had been in communication with Sir Roderick Murchison and Professor Daubeny on this subject, which might prove one of great importance to the practical farmers of the United Kingdom, should the mineral phosphorite, containing as it did so large an amount of bone-earth, be either obtained from abroad at a moderate cost, or be found occurring in our own islands. The council, at the suggestion of the President, directed the secretary to make such inquiries for the information of the members, in reference to this mineral, as might lead to farther researches for the discovery of its occurrence.

Political Neutrality.—Mr. Dawson, of Osgodby Hall, near Selby, addressed a letter to the Council, complaining, as a member of the Society, of political bias in the proceedings of the Council. The President expressed his regret, that any individual should suppose it possible, constituted as the Society was, and engaged as it had now so long been in the promotion of practical agriculture, that the Society could become in any degree political. Neither the individual who for the year presided, as his Grace then did, over the body, nor the Council, as its representatives, had the slightest power, under the stringent conditions of the royal charter of its incorporation, to infringe its neutrality in this respect; on the contrary, if it could be proved that they did so, it would be the duty of her Majesty's Attorney-General, *ex officio*, to take steps for depriving the Society of its chartered privileges. The condition in the charter to which his Grace particularly alluded, was the following:—

"And know ye further, that in granting this our Royal Charter to the said Royal Agricultural Society of England, we do hereby declare it to be our full and entire will and pleasure, that we extend our Royal protection to its national objects, under the condition, that a principle of its constitution shall be the total exclusion of all questions at its meetings, or in its proceedings, of a political tendency, or having reference to measures pending, or to be brought forward, in either of our Houses of Parliament; which no resolution, bye-law, or other enactment of the said body politic and corporate, shall on any account or pretence whatever be at any time allowed to infringe."

The Duke of Richmond concluded by observing, that should unfortunately the Society ever endanger its constitution by any deviation from this salutary restriction, and thus prive itself of the united energy it now derived from the union of all parties in the patriotic object of promoting the practical agriculture of the country, he would be the first man to quit its ranks. On the contrary, believing, as he did, that the Society had been, and would continue to be, of the greatest national importance in developing the resources of the kingdom and promoting the common interest of all who were connected in any relation with the cultivation of the soil, he should give to it, on all occasions, his warmest and steadiest support.

Miscellaneous Communications.—Mr. Graham, of Dalby-terrace, Islington, communicated a paper on what he conceived to be errors in some of the present modes of farming in England, and the plan of a farm homestead.—Dr. Calvert laid before the Council a paper, accompanied by statistical details, on the loss sustained by the grower of corn and the producer of animal food, by the indirect means through which it reached the consumer through the baker and the butcher as "middle-men."—Mr. Dalgairns, President of the Royal Agricultural Society of Guernsey, on measures taken in that island for the production of silk, by the formation of a model farm and the establishment of a laboratory; many hundred Mulberry trees having been planted last spring, several thousand cocoons produced, and the raw material sold to so great an advantage, as to render the growing of silk a subject worthy, in Mr. Dalgairns' opinion, of the attention of English cultivators.—Mr. Law, of Urmston Lodge, presented ears of Cobbett's and Keene's varieties of Indian Corn, grown near Manchester.—Mr. Aplin, of Combe St. Nicholas, called the attention of the Council to the complaints made in Dorsetshire and Somersetshire, that the horned sheep of those counties, being a distinct breed, and unqualified to compete with the Southdowns, had not had a distinct class for fair competition at the Society's Shows. The Council referred this letter to the special Council in Dec. 1851, when the prizes of the next year will be taken into consideration.—Mr. Cotham suggested, that a heavier fine ought to be levied on those exhibitors of implements at the Society's Shows, who bespoke a greater amount of space and shedding than they actually occupied at the time of the Show. This suggestion will be referred to the Council in August next, when the conditions for the show of implements next year would be decided upon.—Sir John Conroy called the attention of the Council to a simple apparatus, by which sacks, filled with heavy substances, may be lifted by a man on his own back, without the assistance usually required of two other men.—M. von Blücher transmitted a copy of his papers on fertilising the surface of land.—The Council ordered their usual thanks for the favour of these respective communications. The Council granted leave for the exhibition to the members, at the next weekly meeting, of a new gutta percha pump for liquid manure.

---

A Special Council was held on Thursday last, the 20th of February, for deciding on the site of the show-yard, &c., and the regulations connected with the Society's country meeting of 1851; present, his Grace the Duke of Richmond, K.G., President, in the chair, Lord Southampton, Hon. R. H. Clive, M.P., Sir Charles Lemon, Bart., M.P., Mr. Bramston, M.P., Mr. Brandreth (Houghton House), Colonel Challoner, Mr. Druce, Mr. Foley, M.P., Mr. Brandreth Gibbs, Mr. Grantham, Mr. Fisher Hobbs, Mr. Kinder, Mr. Sanford (Ninehead Court), Professor Sewell, Mr. Shaw (London), Mr. Villiers Shelley, Mr. Stansfield, M.P., Mr. C. Hampden Turner, and Mr. Jonas Webb.

The President having detailed to the Council the various steps he had taken, agreeably with their request, in reference to a suitable site for the Society's show of breeding stock this year, and the communications into which he had entered with several members of her Majesty's Government on the subject, proceeded to read to the members the correspondence which had taken place between himself and those distinguished individuals. His Grace then desired Colonel Challoner to lay before the meeting the report of the Inspection Committee. The Secretary then received from Colonel Challoner, and at his request, read to the Council the following report:—

REPORT OF THE INSPECTION OF SITES' COMMITTEE.

His Grace the Duke of Richmond, as President of the Society, having placed himself in communication with Lord John Russell, and Lord Seymour, agreeably with the request of the Council, at their last monthly meeting, transmitted to the Secretary of the Society, on the 10th instant, the correspondence which his Grace had had with those noblemen, in reference to the site of the cattle show in 1851; his Grace, at the same time, expressing his wish, that such of the members of the Inspection Committee as were in town, should take an early opportunity of waiting upon Lord Seymour, at the office of Woods and Forests, and of ascertaining from his lordship the conditions required by that department, in reference to a site chosen at Hampton Court, Bushy Park, or Kew, the localities which Lord John Russell had her Majesty's command to place at the disposal of the Society, for the selection of the site in question. His Grace further requested, that after such interview with Lord Seymour, the whole Inspection Committee should be summoned to visit such locality, as might appear, under all circumstances, to be most eligible for the purposes of the Society; in order that they might be prepared to report the result of their inspection to the Special Council, for deciding on the site, to be held on Thursday, the 20th instant.

Accordingly, Colonel Challoner, Mr. Villiers Shelley, and Mr. Brandreth Gibbs, waited, by appointment, on Lord Seymour, on Saturday last; and they had the satisfaction to find, that every disposition was felt by his lordship to promote the objects of the Society, and that the office of Woods and Forests would endeavour to agree to whatever conditions the Council might think it desirable to propose, for the consent and confirmation of that department; his lordship suggesting, that the Committee should, in the first instance, inspect a site of ground in Bushy Park, which he thought, in every respect, admirably adapted for the purposes of the show.

In consequence of this suggestion, the members of the Inspection Committee were summoned to meet in Bushy Park on Tuesday last, the 18th instant, when Colonel Challoner, Mr. Jonas, Mr. Fisher Hobbs, and Mr. Brandreth Gibbs, Members of the Committee; Mr. Hudson, Secretary of the Society; Mr. Manning, Contractor of Works to the Society; and Mr. Stovin, General Manager of Traffic to the South-Western Railway Company, were met by Mr. Wilson, Clerk of the Works under the Commissioners of Woods and Forests, and conducted over the ground. Having made an accurate survey of that portion of the park to which Lord Seymour, after his own personal inspection, had directed their attention; and having taken into consideration its bearings in relation to the convenience of the public, the facilities it afforded to the contractor, and the supply of water for the cattle, the Committee agreed to the following recommendations to the Council:

I. That the open area in Bushy Park, bounded on the north by the public footpath, on the south and east by the running blank wall of the Queen's Paddocks, and on the west by the Lime trees, being a firm level turf on sandy loam, and conveniently situated for the supply of water from the adjoining stream and ponds, the access of the contractor during the progress of the works, and the admission, at several entrances, of the public during the time of the show, whether arriving at either the Kingston or Hampton Railway Station, comprises a space of ground admirably adapted for the purposes of the Society, from which to select a particular site for the show-yard, when the size of the yard required shall be known after the entries have been completed.

II. That leave should be requested—

1. To erect a pump for raising the water from the stream or ponds above the level of the show-yard, for the purpose of having it conducted by water-proof tubing, or otherwise, into the yard.
2. To allow the Society's contractor to convey his materials for the erection of the yard through the Hampton-Wick double carriage gates, near the Clapper Stile.
3. To make at the Society's expense a direct entrance from the Stud-gates (in the turnpike-road between Hampton-court Park and Bushy Park) through the wall of No. 15 Paddock into Bushy Park, immediately opposite to the contemplated site for the show-yard.
4. To be afforded facilities of free ingress, egress, and occupation granted on all former occasions to the Royal Agricultural Society of England by the great municipal corporations throughout the kingdom.

III. That His Grace the Duke of Richmond be requested, as the President of the Society, to enter into further communication with Lord Seymour, as Chief Commissioner of her Majesty's Woods and Forests, in reference to these recommendations.

(Signed) C. B. Challoner.
W. Fisher Hobbs.
B. T. Brandreth Gibbs.

On the motion of Mr. Brandreth, seconded by Mr. Kinder, this report was unanimously adopted by the Council.

On the motion of Colonel Challoner, seconded by Mr. Fisher Hobbs, a vote of thanks was passed unanimously to Lord Seymour, for the plans of Bushy Park, presented by his Lordship to the Society for the use of the Council. Colonel Challoner took that opportunity of explaining these plans to the Council; and of remarking, that the site in question was adapted in every respect to the purposes of the Society, being situated within a short distance from the three Railway Stations of Kingston, Hampton, and Twickenham, by which the show would be fed by visitors from every part of the country: in fact, that had the Society had the choice of the whole kingdom, a more advantageous site could not possibly have been found.

The report of the general Middlesex Committee was read and adopted.

The Council then agreed to resolutions having reference to the following points:—

1. That at the Hampton Court Meeting of the Society, in 1851, there shall be a Pavilion dinner for 2500 persons, on Wednesday, the 16th of July.
2. That Saturday, the 17th of May, shall be the last day for receiving entries of stock for the Show.
3. That the week commencing Monday, the 14th of July, be the week of the Show.
4. That stock may be admitted into the yard at 8 A.M. on the Friday previous to the Show week; but must all be in the yard by 4 P.M. on the Saturday.
5. That the judges make their awards on the Monday.
6. That on the Monday evening, after the judges have completed their awards, the public may be admitted at 1*l.* each person; and governors of the Society, and members of Council, at 2*s.* 6*d.* each.
7. That the days of public show be—
   (1) Tuesday, at 5*s.*
   (2) Wednesday, at 2*s.* 6*d.*
   (3) Thursday, at 1*s.*
   } From 6 in the morning till sunset.
8. That on the Thursday the sheep hurdles shall have an extra upper bar screwed into them, for the purpose of protecting the animals from injurious handling by the public; and that a notice be put up on that day interdicting all attempts to handle the sheep.
9. That at 9 P.M., on Thursday, the stock may be allowed to leave the yard.

The Council then agreed to the regulations of the prize sheet, referring the details consequent on these resolutions to the decision and arrangement of the general Middlesex committee.

The Council stands adjourned to Wednesday next, at 12 o'clock, when the Chev. Claussen will explain his process for the preparation of British cotton.

METEOROLOGICAL REPORT.—FEBRUARY.

(*Continued from page 93.*)

[We regret that through press of matter the first part of this report was omitted in our Number of last week.—ED.]

| Date. | Time. | Max. | Min. | WIND, and REMARKS. |

* This storm came from S.W., and went to N. and N.E. Probably it crossed the centre of Scotland and went towards Norway.

† From the warm, incessant, driving, southerly rain during the first portion of this storm, I infer that it came from the Bermudas and the Westward, and that on reaching Ireland it curved to the Eastward, crossing that island, over Dublin, the Isle of Man, and North of England.

‡‡ A storm crossing England merely due Eastward; and producing frosts from the back current of a centre, rotating over the German Ocean.

§ A storm passing up Channel from W. to E., being the storm's eye, and similar to that of the 31st January; but of small diameter, and being rapidly succeeded by the following, viz.,

‖ A storm of very extensive diameter, which came from the west, and which I watched during the whole of the 13th from the high ground near Shaftesbury and Blandford. I think it must (after crossing England) have curved to the southward, a very unusual circumstance; but if the hypothesis be correct, likely to have produced heavy north-westerly winds in the south of France. I apprehend the gales of the Gulf of Lyons to arise from currents of this description, which travelling to the south, and being confined between the high lands in that direction, seek to escape along the western coast of Italy.

¶ During the afternoon of Tuesday, the 18th, I watched the passage of this storm from the Island of Portland, as it moved slowly to the eastward; the heavy, massive, and beautifully defined line of vapour presenting a most singular contrast to the bright blue sky immediately bounding it.

From the unusual mildness of the past season, a cold and late spring is generally apprehended; it will therefore be interesting to observe whether a long and hard frost be the result of a current similar to the above, travelling from West to East, or of one travelling from South to North. The most severe frost experienced this season was from one of the latter description, the last week in November; but as the transit of storms of this class is always rapid, their effect may possibly be less permanent, whereas in the case of a transit from West to East (which at this moment of writing causes the present chilliness of the atmosphere), the rate of progress being slow, a greater time elapses before the influence of its backward current ceases to be felt.

Dorchester, Feb. 20th. *F. P. B. M.*

*(To be continued.)*

## Notices to Correspondents.

BRITISH COTTON. We have received a sample of Flax, prepared according to M. Claussen's method, from Mr. Christopher, who advertises on the subject in our columns. It appears well adapted for manufacture from cotton machinery.

COAL TAR: *J. J.* We have not seen an analysis. Coal will yield about 6 per cent. of it. It contains hardly any ash and no nitrogen. It is a compound of oxygen, hydrogen, and carbon, and by distillation separates into coal naphtha and oil and pitch.

COCHIN CHINA FOWLS: *A Subscriber.* See our advertising columns.

ITALIAN RYE-GRASS: *H Thomas.* It is not suitable for permanent pasture. It is good as a mixture, because for the first two years, or perhaps a third, it retains its vigour; but it dies away rapidly, especially if allowed to seed.—*M W.* Sown next month it will give a crop this summer, on land suited for it.

MANGOLD WURZEL: *L A.* They are best planted out in autumn, when they should be set about 2 feet apart every way, and *buried* under the soil. They may be planted *now* in a sheltered spot, without any covering.

MR. COWIE'S SPEECH: *N B.* You will find that it was referred to and commented upon in our Paper two weeks ago.

NORWEGIAN HARROW: *Querist.* It is a clod-crusher, without being a roller. It does not answer to use it except on dry land. It is a good preparer of the land as seed-bed for Wheat.

PAMPHLET: *A B., Leicester.* See page 109

POULTRY. The next exhibition of poultry at Birmingham will probably take place in the middle of December.—*W N.* We know no other way of confining your wild cock or hen within their separate walk, inclosed by a 6 feet paling, surmounted by a wire netting, than either to have a roof of netting over all, or to clip the quill feather of one wing on each bird.—*W D.* We fear the state of the poultry market, including butter and eggs, cannot be given here, as, to make it complete, it would be necessary to establish correspondents in every large town in the kingdom.—*R H M.* You will find all we know about the deformed breast-bones of fowls in the "Poultry Miscellany" for September 18, 1850. Of course deformed birds had better be made ready for the spit as soon as possible, and not kept as stock.—*Aylesbury Ducks.* These are not more delicate in constitution than other kinds; but their young require especial care, because they are produced at least two months earlier than any other duck, and the disadvantages of the weather at that time of the year must be counterbalanced by care and good keep. The advantage of their early breeding is, that you have from them a good fat duckling for the table, just at the period when common ducks are beginning to lay. Brick or stone are considered the very worst flooring a poultry-house can have; boards are bad enough, but both the others are worse. There is nothing like earth rammed down till it is quite hard. For ducks, some straw should always be laid in one part of the roosting-place, which should be removed when it becomes unclean. The disease in your ducks probably arose from the damp unwholesome bricks.

TURKEYS: *F S W* is anxious to know where he can get the dark copper-coloured turkeys. They should be as dark as a dark chestnut horse, or the bronze of a tea-urn.

TURNIPS, &c.: *A B.* If it be a good crop of Turnips the feeding of them on the land will secure your crop of Barley. The best plan for Potatoes is to plant whole sets medium size. If you have none such we would cut the rose end in two, and plant the other half uncut. About sheep: no plan will obviate the need of a daily examination while the fly are about. Lambs may be dipped, to kill tick, &c.; but sheep are not treated so. Keep them in good condition, and the tick need not trouble you.

# Markets.

COVENT GARDE, FEB. 22.

Hothouse Grapes are now over for a season. Pine-apples are still dear, and the supply of good dessert Pears is limited. English Apples are scarce, but foreign ones are sufficient for the demand. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. Vegetables of all kinds are abundant and good, except, perhaps, French Beans, which are still somewhat scarce. Carrots and Turnips are good in quality, and so are Potatoes? Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1s. per pottle. Cucumbers, though good, do not meet with a ready sale. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Tulips, Double Primroses, Cinerarias, Moss and Provins Roses, and the different kinds of spring bulbs.

FRUIT.

HOPS.—FRIDAY, Feb. 21.

Messrs. Pattenden and Smith report that the demand for fine Hops continues good, and prices are fully maintained.

SMITHFIELD, MONDAY, Feb. 17.

We have again a large supply of Beasts, and of good quality. The favourable weather causes a better clearance to be effected, but there is no advance on prices on the average. The number of Sheep is rather larger to-day, still it is small; they are freely disposed of at fully late rates. Trade is more active for Calves, but 4s 6d. is an extreme quotation. From Holland and Germany there are 452 Beasts, 990 Sheep, and 76 Calves; from France, 80 Sheep; from Norfolk and Suffolk, 2200 Beasts; from Scotland, 300; and 200 from the northern and midland counties.

| Per st. of 8 lbs. | s | d | s | d | Per st. of 8 lbs. | s | d | s | d |
|---|---|---|---|---|---|---|---|---|---|
| Best Scots, Herefords, &c. | 3 | 4 to 3 | 6 | | Best Long-wools | 3 | 10 to 4 | 0 | |

| | | | | | Pigs ... ... | 2 | 8 — 3 | 4 | |

Beasts, 3797; Sheep and Lambs, 19,090; Calves, 127; Pigs, 280.

FRIDAY, Feb. 21.

The supply of Beasts to-day is not very large; however, it far exceeds the demand. Lower prices are taken, yet many remain unsold. The number of Sheep is again small; in consequence we maintain Monday's quotations, but trade is hardly so brisk. Choice Calves are scarce, consequently 4s. 6d. is reached for these, but other kinds are lower. Our foreign supply consists of 60 Beasts, 310 Sheep, and 140 Calves; we have 78 milch cows from the home counties.

Beasts, 627; Sheep and Lambs, 2740; Calves, 210; Pigs, 295.

MARK LANE.

MONDAY, FEB. 17.—The show of Wheat from Essex and Kent this morning was exceedingly small, and the sale by no means brisk; prices must be quoted about the same as on this day se'nnight. Business in foreign continues very limited, almost confined to forced sales, which can only be effected at some reduction in prices.—The value of Barley is supported for all descriptions, as is also that of Beans and white Peas, but grey and Maple are 1s. per qr. cheaper.—The Oat trade is rather firmer than last week, and prices maintained.—Flour is a heavy sale, and we observe no alteration in its value.

FRIDAY, Feb. 21.—This week the arrivals of foreign grain are unimportant, those of Flour good. The attendance at market this morning was small, and business more limited than of late. Foreign must be quoted nominally as on Monday.—Barley of all descriptions is held rather more firmly.—Beans and Peas are unaltered in value.—Oats meet an improved sale at a trifling advance.—The Flour trade is exceedingly heavy, and sales at current rates are impracticable.—Floating cargoes of Black Sea Wheat and Indian Corn remain nominally as last week.

LIVERPOOL, TUESDAY, FEB. 18.—We have fair supplies of Oats and Oatmeal from Ireland this week, and of Barley and Malt coastwise. The foreign arrivals consist chiefly of Flour. The business transacted during the week has been moderate, without any change in the quotations of last Tuesday. There was about the usual attendance at our Corn Exchange this morning. Good fresh parcels of Wheat were in fair request, at similar prices to those paid on Tuesday last, but old granaried samples were quite neglected. The best marks of French Flour commanded full prices, but the rates for other descriptions were irregular. American barrels were unaltered in value and neglected. Barley, Beans, and Peas were dull. Oats and Oatmeal supported late rates. Indian Corn was in moderate request, and could not be bought so well as during the week.——FRIDAY, FEB. 14.—There are no symptoms at present in the corn market. The weather is exceedingly mild and open, and the winter season is passing over rapidly. France continues to pour in upon us her Flour. The same dulness prevailed at our Corn Exchange this morning, and the sales of any article were in mere retail quantities, at prices much the same as were paid on Tuesday last.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND CO. beg to notice their mixtures of GRASS SEEDS for Laying Land down to Permanent Grass, are now ready for delivery. They have reduced the price to 30s. per acre, allowing 2 bushels 12 lbs. to the acre.

Mixed sorts for improving old Grass Land, 1s. 2d. per lb.

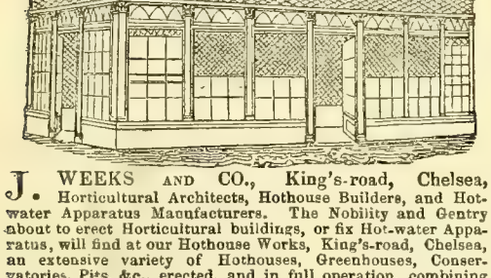
Fine sorts, for forming Lawns, 1s. 3d. per lb. Directions for sowing will accompany the Seeds.

GEORGE GIBBS and Co. will feel happy in sending general priced Catalogues of Agricultural and Garden Seeds, on application to 26, DOWN-STREET, Piccadilly, London.

THE APPROACHING COLD WEATHER.

THERMOMETERS FOR REGISTERING THE EXTREMES OF HEAT AND COLD, of the best construction, 1l. 1s. and 18s.; of the common construction, 15s., 12s. 6d., 10s., 7s. 6d. Night Thermometers for Registering Cold only, 10s., 7s. 6d., 5s., to 2s. 6d. Thermometers for Baths or Brewing, 12s. 6d., 10s., 7s 6d., to 2s. 6d. Hotbed Thermometers to 4 feet long, 25s., 20s., 17s. 6d. Steam pressure Gauges, 2l. 5s. and 2l. 2s. Rain Gauges, from 10s. Lactometers for showing the Quality of Milk, with instructions for use, 15s., 12s. 6d., 10s., 7s. 6d., 5s. Hydrometers, for trying Sulphuric Acid, 10s., 7s. 6d., 5s. Barometers, Microscopes, Telescopes, Drawing Instruments, &c.

HENRY BAKER, Instrument Maker to the Board of Admiralty, 30, Hatton-garden, London.



BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Aloert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks. &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

CUCUMBER and MELON BOXES and LIGHTS.

One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1l. 4s. Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England.—JAS. WATTS, Hot-house Builder, Claremont-place, Old Kent-road, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

REGISTERED ROLLER MILL for Crushing Linseed Oats, Malt, Barley, &c., and Breaking Beans and Peas. Manufactured by E. R. TURNER AND CO., late HURWOOD and TURNER, St. Peter's Foundry, Ipswich.

E. R. TURNER and Co. claim for their registered Roller Mill the particular attention of Agriculturists Housekeepers, and others. Besides accomplishing all the purposes of the well-known Roller Mill for crushing Corn and Seeds, by an entirely novel arrangement it is made to break Beans and Peas most effectually, and without involving any delay in adapting the Mill from one process to the other. They are very simple in construction, and therefore not liable to get out of repair; may be worked with ease by one man, and for efficiency and cheapness are superior to any Implement of the kind yet manufactured. Price complete, 9l. 9s.

E. R. T. and Co. also manufacture a Roller Mill for Crushing only, of the same size as the Registered Roller Mill, and a larger Mill, for which HURWOOD and TURNER were awarded the Royal Agricultural Society's Prize at Norwich in 1849.

Price of Small Roller Mill ... ... ... £7 10s.
" Norwich Prize Mill, for Horse, Steam, or Hand Power ... ... ... 10 10

Delivered Free to London, Norwich, Bury St. Edmunds, and all intervening Stations. To Hull by water, and all places within 50 miles of Ipswich.

A Discount of Five per cent. allowed for Cash payments.

DESICCATED ANIMAL MANURE.—This Manure, which has proved so eminently successful in the culture of both Cereal and Green Crops, can now be had of the Manufacturers, J. M'CALL and Co., 60, Spring Gardens, Manchester; RITCHIE and M'CALL, 137, Houndsditch, London; and of all Agents Price 7l. per ton.—Copies of Analysis and Testimonials forwarded post free on application.

IRISH PEAT CHARCOAL.

TO FARMERS, AGRICULTURISTS, AND OTHERS.

THE IRISH AMELIORATION SOCIETY beg to draw the attention of the public generally to the fertilising and deodorising properties of Irish Peat Charcoal. Mixed with night-soil or sewage matter it instantly and wholly destroys all offensive smell, renders it easy of manipulation, adapts the fertilising properties as a ready food for plants, and enables it to be transported by Railway or any other conveyance without the slightest inconvenience.

The extent to which Charcoal (carbon) enters into the composition of every article of agricultural produce, and the value of night-soil as a manure, render any observations on these points unnecessary. Mixed with night-soil, in about equal weights, a most efficacious manure is produced at a very small cost.

Price of the Charcoal, ready for use, at Dublin, 47s. per ton; in London, Liverpool, Bristol, and other seaports in England, 60s. per ton, sacks included.—Agents for the sale of the Society's Charcoal have been appointed at several of the principal seaports and Inland towns, a list of whom, together with all other information, may be had on application at this office.

By order of the Court,
Feb. 22, 1851. GEORGE L. PARROTT, Secretary.
Head Office, 9, Waterloo-place, London.

MANURE DEPOT.—PEAT CHARCOAL.

TO FARMERS AGRICULTURISTS, AND OTHERS.

G. H. FOLEY, Essex Coal Wharf, Lea-bridge, Middlesex, Agent by appointment to the Irish Amelioration Society, for the sale of the above. All needful particulars will be given on application at the above address.

Price of the unmixed Charcoal, 60s. per ton, sacks included. Mixed with Nightsoil, 45s. per ton, sacks included.

IRISH PEAT CHARCOAL.

TO FARMERS, AGRICULTURISTS, AND OTHERS.

MESSRS. ODAMS AND PICKFORD, 35, Leadenhall-street, having been appointed by the IRISH AMELIORATION SOCIETY sole Agents, for London, for the sale of their PEAT CHARCOAL, beg to say full particulars of prices, &c., may be obtained on application to them.

ODAMS and PICKFORD, 35, Leadenhall-street, City.

SALT for Agricultural Purposes, Asparagus Beds, Garden Walks, &c., &c., price 23s. per Ton, delivered in Sacks to any Railway Station in London. Sacks to be paid for or returned. Apply to JOHN MEREDITH, Salt Merchant, 10 Wharf, City-road Basin, London. N.B. Rock Salt.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES; AND PLATE GLASS FOR DWELLINGS.

THOMAS MILLINGTON supplies SHEET GLASS, packed in 100 feet boxes, at the following low prices:

STOCK SIZES.

| | | | |
|---|---|---|---|
| 6 by 4 to 6½ by 5 ... 12s. each. | | 9 by 7 to 10 by 8 ... 15s. each. | |
| 6½ by 5½ to 8 by 6 ... 13 | " | 11 by 8 to 14 by 10 ... 16 | " |

16 oz. SHEET GLASS in 200 feet cases.

If 10 cases are taken, 38s. per case; if 5 cases are taken, 40s. per case; or if a single case, 42s.

ROUGH PLATE GLASS.

Rough Plate Cast, perfectly flat and uniform, the best manufactured. A small sample upon application.

Glass Shades for Ornaments, Sheet and Rough Plate Tiles, Milk Pans, Propagating and Bee Glasses, Lactometers, and all other articles in Glass for Horticultural purposes. Priced List sent on application.

Oils, Colours, Varnishes, Sheet, and White Lead.
87, BISHOPSGATE-STREET, WITHOUT,
Same Side as Eastern Counties Railway.

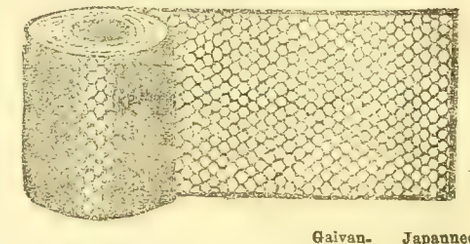
HOSE FOR FIRE ENGINES AND AGRICULTURAL PURPOSES, made of canvas, coated and lined with gutta percha, at about one-third the price of leather or India rubber; it is well suited for the conveyance of water, acids, and liquid manure, under great pressure. It is patronised by the Admiralty, at the Government Public Offices, and is extensively used by Agriculturists, giving great satisfaction.—Testimonials and prices can be obtained at Messrs. BURGESS and KEYS, 103, Newgate-street, sole Manufacturers.

COCHIN CHINA EGGS.—As a general answer to various Correspondents and others, H. COPLAND will supply the public with Eggs from these fine and prolific Birds, at 10s. a setting of 13 Eggs.—Apply to Mr. H. COPLAND, Chelmsford, Essex.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

IRON GATES, HURDLES, &c.

THOMAS PERRY AND SONS, 252, OXFORD-STREET (NEAR HYDE-PARK), And Highfields Wrought and Cast-iron Works, Bilston, Staffordshire, Manufacturers of every description of Park Entrance, Carriage and Field Gates, Wickets, &c.; Plain and Ornamental Fencing and Palisading; Ox, Cattle, Sheep and other Hurdles; Tree Guards, Garden Seats, Hay Racks, Wheelbarrows; Land and Garden Rollers, Stable Fittings, &c. &c.



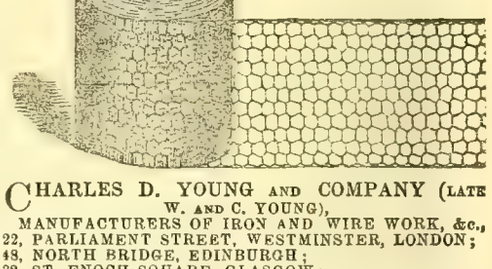
The works being situated in the centre of the Staffordshire Iron district, THOMAS PERRY AND SONS are enabled to execute promptly orders to any extent with the greatest facility, of the best quality, and most moderate terms. A great variety of the above articles always kept in Stock at the London Warehouse, and at the Works. Drawings and prices may be obtained on application, or furnished free by post.

METCALFE AND CO'S NEW PATENT TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1s. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co's, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2s. per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.



| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24-inch wide ... | 7d. per yd. | 5d. per yd. |
| 2-inch " strong " ... | 9 " | 6½ " |
| 2-inch " extra strong " ... | 12 " | 9 " |
| ¾-inch " light " ... | 8 " | 6 " |
| 1⅝-inch " strong " ... | 10 " | 8 " |
| 1½-inch " extra strong " ... | 14 " | 11 " |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9d.; 24 ins., 1s.; 30 ins., 1s. 3d.; and 36 ins., 1s. 6d. per lineal yard.

| | | | |
|---|---|---|---|
| Or a web of 100 yards, 18 ins. wide, will cost | .. | .. | £3 15 0 |
| Do. of 100 yards, 24 ins. wide | .. | .. | 5 0 0 |
| Do. of 100 yards, 30 ins. wide | .. | .. | 6 5 0 |
| Do. of 100 yards, 36 ins. wide | .. | .. | 7 10 0 |

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1s. is equal to 2½ yards of another article in the market, the same width, at 9d. per yard. Samples for inspection sent free of expense.

C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

THE HIPPOPOTAMUS, presented to the ZOOLOGICAL SOCIETY by H.H. the Viceroy of Egypt, is Exhibited daily at their Gardens, in the Regent's Park, from 11 to 4 o'clock. Visitors desirous of seeing the Animal in the water are recommended to go early.

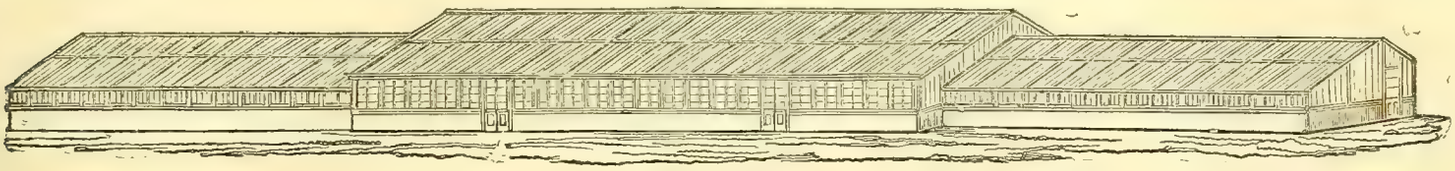
Admission, One Shilling; on Mondays, Sixpence.

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—In consequence of a very inferior article being now too frequently sold under the name of these favourite Ales, the public are respectfully requested to apply at the respective stores, where a list of bottlers will be furnished, from whom these ales may be obtained genuine, and where also they may be had in casks of 18 gallons and upwards, either singly or in any quantity. Apply to Messrs. SAMUEL ALLSOPP and SONS, The Brewery, Burton-on-Trent, or their Stores, at 61, King-William-street, City; Cork-street, Liverpool; High-street, Birmingham; the Exchange, Manchester; and 33, Virginia-street, Glasgow.

APPETITE AND DIGESTION IMPROVED.

LEA AND PERRINS' WORCESTERSHIRE SAUCE imparts the most exquisite relish to Steaks, Chops, and all Roast Meat Gravies, Fish, Game, Soup, Curries, and Salad, and by its tonic and invigorating properties, enables the stomach to perfectly digest the food.

The daily use of this aromatic and delicious Sauce is the best safeguard to health.



Sold by the Proprietors, LEA and PERRINS, 6, Vere-street, Oxford-street, London, and 68, Broad-street, Worcester; also by Messrs. Barclay and Sons, Messrs. Crosse and Blackwell, and other Oilmen and Merchants, London; and generally by the principal dealers in sauce.

N.B.—To guard against imitations, see that the names of "LEA and PERRINS" are upon the label and patent cap of the bottle.

# GRAY AND ORMSON,

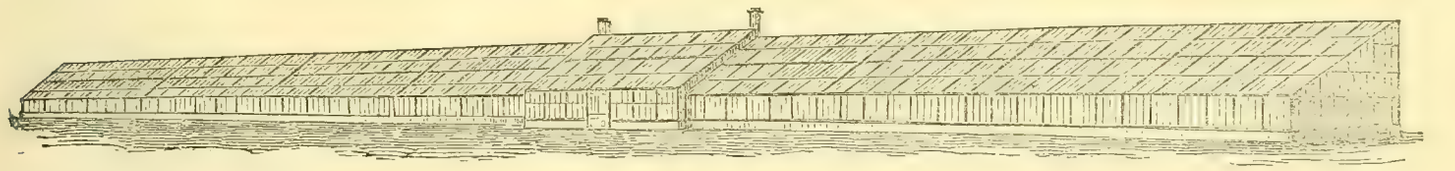
## DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[Erected for John Shaw Leigh, Esq., Luton Hoo.]

Extract of a Letter from Mr. Fraser.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, John Shaw Leigh, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.



(Signed.) "James Fraser, Gardener, Luton Hoo Park."

---

### BY HER MAJESTY'S ROYAL LETTERS PATENT.

# PATENT HOTHOUSE WORKS, KING'S-ROAD, CHELSEA.

## E. DENCH, PATENTEE.

This Range, consisting of Nine Houses, varying from 24 feet to 30 feet long, by 16 feet to 19 feet wide, each, which are all heated by Hot-water, being half the number erected for Edward L. Betts, Esq., Preston Hall, Aylesford, near Maidstone, Kent.

Mr. Thomas Frost, the Head Gardener, has proved the superiority of these Houses for the growth of both Fruits and Plants, and will give every information.

THE PATENT consists of two distinct principles for all Horticultural Erections—on one plan the Roof is formed wholly of Iron and Glass, no wood or putty, &c., and not more than three-quarters of an inch of light being taken up anywhere, and is very light, strong, and elegant, free from drip, and perfectly impossible for the rain to penetrate; the other principle consists of the Roof being formed in Sashes, and the surface of the Roof being Iron, Glass, and Putty, and, the work being hollow, is perfectly free from contraction or expansion. These Houses have been proved in all parts, and are found to excel all others. Heating by Hot-water on most scientific principles.

ONE GOOD SECOND-HAND HOUSE FOR SALE.

---

## *SALES BY AUCTION.*

BRENTFORD, MIDDLESEX.—FINAL SALE.
To Noblemen, Gentlemen, Nurserymen, Market-Gardeners, and others engaged in planting.

MESSRS. PROTHEROE and MORRIS are instructed by the Executors of the late Mr. J. Ronalds to offer to public competition, by Auction, on the premises, the Butts and Twolands Nurseries, Brentford, Middlesex, on MONDAY, February 24th, and following day, at 11 o'clock. The whole of the remaining NURSERY STOCK, consisting of a rich assortment of Fruit and Forest Trees, Evergreens, Ornamental and Deciduous Shrubs, American Plants, &c. May be viewed, and Catalogues had (6*d.* each, returnable to purchasers), prior to the Sale, of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

---

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS are instructed to sell by Auction, at the Mart, Bartholomew-lane, on THURSDAY, February 27th, about 200 choice double Camellias, from 2 to 5 feet, well set with bloom buds; also a quantity of Lilium lancifolium, in varieties; a selected assortment of standard and dwarf Roses, American plants, comprising fine Hybrid Rhododendrons, Ghent Azaleas, Andromedas, &c.; together with a choice collection of Dahlias in dry roots. May be viewed the morning of sale, and Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

---

HIGHBURY NURSERY.
To Gentlemen, Nurserymen, Proprietors of Tea Gardens, &c.

MESSRS. PROTHEROE and MORRIS will sell by Auction, on the Premises, Highbury Nursery, opposite Highbury Barn Tavern, Islington, on MONDAY, March 3d, 1851, and following day, at 11 o'clock each day, by order of the Proprietor, in consequence of the land being let for building, the whole of the CHOICE NURSERY STOCK, consisting of fine Evergreens, Deciduous Shrubs, and Ornamental Trees; also, the selected Greenhouse Plants, comprising large Camellias, Azalea indica, large Araucaria, Rhododendron Arborea, Oranges, Myrtles, Ficus elastica, Geraniums, Fuchsias, Cyclamen, &c.; together with the Pits, Frames, and Lights, Hand-glasses, Wheelbarrows, a quantity of well seasoned Bog, Potting Mould, &c.; a Summer House; an Erection or Tea Booth, 36 feet by 18; Tables, Forms, Tea Trays, Crockery; 2 Coppers; a Swinging Boat; Utensils in Trade, &c. May be viewed prior to the Sale; Catalogues had, 6*d.* each, returnable to Purchasers on the Premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

---

FINAL SALES.
TO NURSERYMEN, BUILDERS, AND OTHERS.

MR. D. A. RAMSAY having received instructions from Messrs. Dennis and Co. to submit the whole of the remaining NURSERY AND OTHER STOCK, GREENHOUSES, IMPLEMENTS IN TRADE, &c., to public competition during the ensuing season, in consequence of the lease expiring at Christmas next, will sell by Auction, on the premises, opposite Cremorne Gardens, King's-road, Chelsea, on TUESDAY, February 25th, and following day, at 12 o'clock, without reserve, a portion of the valuable Nursery Stock, comprising extra large Aucuba, Hollies 3 to 5 feet high, Box, Laurels, and other Evergreens; prize Gooseberries, fruit bearing and other Mulberries; large Ivies, Jasmines, and other Climbers; Roses, Deciduous Shrubs, Garden Frames and Lights, &c. Due notice will be given of future sales of the above stock.—May be viewed prior to sale. Catalogues may be had on the premises; at the principal Seed Shops; and of the Auctioneer, Brompton Auction Ground, Fulham-road, Brompton, near London.

Important Sale of about 200 Camellias, from 18 in. to 5 ft., and some very strong Camellia Stocks, American Plants, Standard and Dwarf Roses, and Dahlias in dry Roots, &c.

MESSRS. PROTHEROE and MORRIS beg to announce that their Annual Sale of Camellias will take place at the Auction Mart, Bartholomew Lane, on THURSDAY, March 6th, at 12 o'clock. The Plants are very healthy, and beautifully furnished with bloom buds. May be viewed the morning of sale; Catalogues may be obtained at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

---

SOUTHAMPTON.—FINAL SALE.
To Noblemen, Gentlemen, Nurserymen, and others engaged in planting.

MESSRS. PROTHEROE and MORRIS are instructed to offer to public competition, by Auction on the premises, Page's Hill and Sidford Nurseries, the second week in March, the remainder of the valuable NURSERY STOCK, consisting of Evergreens, Ornamental Fruit and Forest Trees, Deciduous Shrubs, Greenhouse Plants, several Lights and Boxes, Seeds, &c. May be viewed, and Catalogues had, one week prior to the Sale, on the premises of Mr. Brooks, Accountant, 24, Portland-street, Southampton; at the principal Inns in the neighbourhood; Seedsmen in London; and of the Auctioneers, Leytonstone, Essex.

---

EXTENSIVE IMPORTATION OF DUTCH FRUIT TREES, BELGIAN CAMELLIAS, STANDARD ROSES, AZALEAS, &c. &c.

MR. HASLAM will sell, as above, at Auction Mart, on WEDNESDAY, March 5, and following days. Further particulars in next week's *Chronicle*.

---

GLOUCESTERSHIRE.—ROYAL NURSERY, CIRENCESTER. SECOND SALE.

MESSRS. JEFFERIES and CO. beg to notify that they will proceed to the Second Sale of Nursery Stock, upon the above-named premises, by order of the Assignee of the Estate and Effects of Mr. William Gregory, on TUESDAY, WEDNESDAY, and THURSDAY, March 4th, 5th, and 6th. The second portion of the Stock comprises black and white American, Norway, and Hemlock Spruce; Silver, Scotch, Larch, and Balm of Gilead Firs; Weymouth Pines, Pinus austriaca, Laricio, Mughus, &c., of various heights; Limes, Acer, Birch, and other Ornamental Trees, 12 to 15 feet high, fit immediately for Park Trees; Oaks, grafted Elms, Beech, Hornbeam, Hazel, &c.; many thousands of variegated and other Hollies, Yews, Irish Yews; American, Chinese, and Siberian Arborvitæ; Mahonias, Red Cedars, Phillyreas, Aucubas, hardy Heaths, common Laurels, Lucombe's and Evergreen Oaks; pink, scarlet, and other Thorns; Laburnums, purple and fern-leaved Beech, Fraxinus, Sorbus, Cytisus, together with an immense number of ornamental Deciduous Shrubs, such as Lilacs, Ribes, Honeysuckles, Syringas, Deutzias, Guelder Roses, Berberis, Spiræas, &c.; Standard and Dwarf Roses, in great variety; the well-known choice and extensive collection of Conifers, which drew forth such general admiration at the last Sale, will be arranged in Lots of 150, 100, 50, 25, &c., also the extensive assemblage of Stove and Greenhouse Plants, together with a large quantity of Standard and Dwarf Apples, Pears, Plums, and Cherries, Gooseberries, Currants, &c. The whole of which will be fully detailed in Catalogues, to be had at the Nursery; at the principal inns in the neighbourhood; at Baily and Jones' Printing-office, and at the Auctioneers' Office, Cirencester. The Sale will commence each morning punctually at 11 o'clock. Parties residing at a distance and requiring Catalogues shall be supplied with them on their enclosing four postage stamps. As the whole of the above stock has been grown under the superintendence of Mr. R. Rea, he will be happy to receive and execute any commission with which he may be entrusted by parties residing at a distance.

---

PATENT CREOSOTED FISH FOR MANURE.—This manure is composed entirely of animal matter. The analysis of an eminent chemist states that one ton of the prepared fish contains 263 lbs. of ammonia, 150 lbs. of phosphate of lime, and 39 lbs. of potash. It will be seen that they contain all the manuring properties of the best guano, and as they cannot be adulterated, they will be found to be a most useful manure for Potatoes, Wheat, Oats, Carrots, and all root crops. They also have the property of preventing the Potato disease. All the Potatoes planted with them last year, produced good crops, and were entirely preserved from the disease, although the neighbouring fields greatly suffered. See Report of the Royal Agricultural Society of Dec. 11, 1850. Price 5*l.* per ton. Orders received by Mr. Henry Hill, Corn Exchange, Mark-lane; Mr. George Bush, 22, Abchurch-lane; and Mr. Bennett, 73, Mark-lane.

---

PERMANENT PASTURE.

HENRY ROGER SMITHE, of Eastling, Faversham, Kent, informs the Public that his mixtures of the Natural Grasses and small Clovers—excluding no sort which is proper to form a PERMANENT PASTURE, as the soil &c. may direct—are now ready; delivered on the railway free of charge, at 1*l.* per acre, allowing 3 bushels as seed for an acre; also Lawn Mixtures, and the sorts separate. They are gathered under his immediate superintendence, and are quite new; this unprecedented low price last year, and the prospects of agriculture, having created an unlooked-for demand.

---

IMPROVED METALLIC FLOWER LABEL

ADVANTAGES OF THE IMPROVED METALLIC FLOWER LABEL OVER ALL OTHERS. They are less liable to disturb the roots; they are indestructible; they are uniform and ornamental; they are smoother, and can be written upon either with lead pencil on wet paint, as on wood, or with chemical ink. Price 2*s.* per 100.

May be had of T. Lockhart, Seedsman, 84, Fleet-street, London; or Wholesale to Dealers, of S. Rooke, jun., 7, Whitall-street, Birmingham.

---

DESTRUCTIVE ANIMALCULÆ.

READ'S GARDEN ENGINES and MACHINES.—As Spring approaches, the Larvæ of destructive insects are propagated in infinite multitudes, to the great injury of the young Shoots of Trees, Vines, Plants, and every species of Vegetation put into motion and growth by the genial influence of the season. Richard Read, Instrument Maker (by special appointment) to her Majesty, begs to inform Amateur and Practical Gardeners, &c., that he has made considerable Improvements in his GARDEN ENGINES and MACHINES, which are now so perfect that he will warrant the valves to keep in repair during the term of the patent.

Manufactured only by R. Read, 35, Regent-circus, Piccadilly, London.

---

HAYTHORN'S HEXAGON GARDEN NET.

Noblemen, Clergymen, and Gentlemen who have Gardens or Hothouses, are respectfully invited to transmit their address to Mr. J. W. Haythorn, 4, Clinton-street, Nottingham, who will forward free, by post, particulars and patterns of his HEXAGON GARDEN NET, the best and cheapest article, highly approved, and now generally used for the protection of bloom, fruit, and flowers, from frosts, birds, wasps, flies, children and servants, and also for placing on Hothouses, effectually keeping out birds and insects, without preventing the admission of light and air. Parcels are sent, carriage-paid, to London, Liverpool, Bristol, Newcastle, Hull, &c., and intermediate stations.

# PRICE LIST OF GENUINE SEEDS FOR 1851.

GEORGE BAKER begs most respectfully to tender his sincere thanks to his numerous Patrons, who, for so many years, have favoured him with their orders; and to assure those who have not yet given him a trial, that all orders entrusted to his care shall meet with prompt attention, every article shall be of the best quality, and carefully proved before sent out. The following choice collection of Garden Seeds are now ready for sending out, carefully packed in cases, for 1*l.* 1*s.*; cases not charged.

GEORGE BAKER, SEEDSMAN, WELLS, SOMERSET.

# DRAINAGE.

## NEW LEVELLING INSTRUMENT, REGISTERED 28TH DECEMBER, 1850.

THIS is a Simple and Effective SELF-RECORDING INSTRUMENT suitable for Levelling DRAINS, SEWERS, or ROADS, or for measuring the Elevations and Depressions of Ground. The Figure represents the Instrument one-fourth the real size.

A is a telescope; B, a joint; E, a level; M, screw for raising or lowering the eye end of telescope; H, a segmental graduated scale. The zero of this scale is at I, in a line coincident with the horizontal axial line of the telescope, and an index J is carried on the side of the telescope for cutting the graduations. The graduations are so proportioned as to show the rise or fall in feet and inches per 100 ft. of the horizontal distance. The socket G is fitted to the ordinary tripod stand, which is about 5 feet high.

INSTRUMENT, with Tripod Stand and Box, 3*l.* 12*s.*

From the *Practical Mechanics' Journal*, 1st February, 1851.

"In the hands of even the most unlettered farm servant this little instrument will afford the most correct measurements, as the operator has only to level the plate D, and bring his sight to bear upon the object, when the elevation or depression is given at once. It will be a most useful contrivance for Draining or Road-making."

**Made only by GARDNER AND CO., Opticians, 21, Buchanan-street, Glasgow.**

GREAT WESTERN, SOUTH-WESTERN, AND SOUTH-EASTERN RAILWAY SEED ESTABLISHMENT,
FOR SUPPLYING GENUINE HOME-GROWN SEEDS, CARRIAGE FREE.

## SUTTON'S COLLECTIONS OF GARDEN SEEDS.

*For the convenience of Gentlemen who may not be well acquainted with all the best kinds of Garden Seeds, and the proper proportions of each generally necessary to stock a large or small Garden,* MESSRS. SUTTON *have during the last seven years been in the practice of making complete Collections for one year's supply, the economy and other advantages of which system have been fully appreciated by the purchasers, as indicated by numerous recommendations and annual increase of orders.*

| | £ | *s.* | *d.* |
|---|---|---|---|
| No. 1. A COMPLETE COLLECTION OF KITCHEN GARDEN SEEDS FOR A LARGE GARDEN, for one year's supply ... ... ... ... ... ... ... | 2 | 10 | 0 |
| No. 2. A COMPLETE COLLECTION OF DITTO, in quantities proportionately reduced ... ... ... | 1 | 10 | 0 |
| No. 3. A COMPLETE COLLECTION OF DITTO, equally choice sorts ... ... ... ... ... | 1 | 1 | 0 |
| No. 4. A SMALL AND CHOICE ASSORTMENT OF DITTO ... ... ... ... ... ... ... | 0 | 12 | 6 |

Persons who are already in possession of several kinds of Seeds are requested to send the names, that they may be omitted in the collections they may order, and additional quantities of other sorts will be given in lieu of them.

*For particulars of the sorts contained in these Collections, see Advertisement on the last page of the* Gardeners' Chronicle, *of January* 25.

JOHN SUTTON and SONS are also extensive growers of early Potatoes, and Agricultural Seeds, particulars of which may be had by post.

*Reading Seed Warehouse, Reading, Berks.*

TO POTATO AND CUCUMBER GROWERS.

JAMES LAKE, NURSERYMAN, &c., Bridgewater, Somerset, begs to inform the Public that he is now ready to send out his Seedling FIFTY-FOLD KIDNEY POTATO, which has been proved and highly recommended by Dr. Lindley, Messrs. Beck and Henderson, Hurst and M'Mullen, and many others. Price 4*s.* per peck.

London Agent: Hurst and M'Mullen, 6, Leadenhall-street.

J. L. having grown from 15 to 20 lights of Aban's Conqueror of the West CUCUMBER successfully for three years, can with confidence recommend it to the Public as being one of the best kinds in cultivation. Packets containing 12 seeds, 1*s.* each.

EARLY ALBION KIDNEY POTATO.

EDWARD MITCHELL having a surplus stock of SEED POTATOES of this first-rate early variety, begs most respectfully to offer them to the public, and the trade generally, as being one of the very best and earliest varieties grown, it being full three weeks earlier than the Ash-leaf or Walnut-leaf Kidney Potatoes; also a greater cropper, and far superior in flavour, than any other variety grown. Price, per bushel, 8*s.*, with the usual discount to the trade.

EARLY COLCHESTER.—A round variety, of superior quality, as early as the Early Frame, but a more prolific cropper, and of first-rate flavour. Price 6*s.* per bushel, with the usual discount to the trade.

Post-office orders are expected from unknown correspondents.

Bristol Gardens, Kemp-town; and 55, Marine Parade, Brighton.

SEEDLING SCOTCH FIRS.—The Subscribers have to offer to the trade a few hundred thousand 2-year SEEDLING SCOTCH FIRS, the produce of seed from Strathspey natural Forests. Price moderate.

HOWDEN, Brothers, Muirtown Nurseries, Inverness.—Feb. 22.

*** There is direct steam communication from Inverness to London, Glasgow, and Edinburgh.

WANTED, a place as a MARKET GARDEN, from 2 to 6 acres, not more than 10 miles from town; one with a Greenhouse on the Premises would be preferred.—Direct, stating all particulars, to J. H., Ivy-cottage, Harrow Weald, Stanmore.

THE REGISTERED ROSE GIRDLE-LABEL.—A Rose Grower (having found, by long experience, the present method of securing Standard Plants by wires of any kind, and cord or rope of whatever description, to be highly injurious to the bark, and otherwise detrimental to the growth of the plant, besides being clumsy, troublesome, and ineffectual), has the pleasure of submitting to Amateurs and the Public a new Invention which he has recently introduced, for the more efficient and neat fastening of Roses and other Standard Plants to their Stakes.

The REGISTERED ROSE GIRDLE now offered to the Public, besides the advantage of being well adapted for a neat and permanent Label to the plant which it secures, will greatly diminish the time and trouble attending the mode hitherto pursued in the tying of Standard Plants to their stakes. The utility of this invention, while combining two important objects (till now very imperfectly attained), cannot but entitle it, from those who wish a neat and permanent Label as well as an efficient fastener for their Standard Plants, to an additional claim. It is neat as it is efficacious, and as cheap as it is useful.

EXTRACT FROM "FLORIST'S DIRECTORY."—"We consider it one of the most useful articles that have been invented—it forms a permanent Label as well as an unerring fastening, and we shall be disappointed if it is not generally used for Roses and Standard Cytisuses. We shall adopt it for everything we can apply it to in the garden."

Sold, wholesale and retail, by WILLIAM HAMILTON, Seedsman and Florist, 156, Cheapside, London; and to be had of all Nursery and Seedsmen. Price 1*s.* 6*d.* per dozen.

BRITISH QUEEN POTATO.—A new and superior variety, as early as the SHAW, and quality of the REGENT, coming in a month before that kind. The grower says:—"I planted them last year close by a good stock of Shaws; they were quite as early, and, when each were full grown, the BRITISH QUEEN were worth considerably more money, being much like a Regent, and ready nearly a month before it. My salesman considers them preferable to any Potato he ever saw. They grow short haulm and in a cluster, and will admit of being planted closer together than most sorts."

To be had only of NOTTING and SONS, Seedsmen, 46, Cheapside, London, at 9*s.* per bushel; where may be had every approved kind of Agricultural, Horticultural, and Floricultural Seeds.

TO BE LET, with immediate possession, in the flourishing market town of Reading, within a short distance of the Market-place, close to the Reading and Reigate Railway Station, and also within 10 minutes' walk of the Station of the Great Western Railway, a SMALL NURSERY GROUND, with Seed-shop and Cottage attached, and three Greenhouses.—For particulars, apply to F. J. BLANDY, Esq., Solicitor, Reading, Berks.

FARM IN HAMPSHIRE.

TO LET, a Good STOCK FARM, of about 484 acres, of which 24 acres are Water Meadow, 55 acres dry Pasture, and the remainder Arable. The Poor Rates are very low, and the Tithe amounts to about 4*s.* 6*d.* per acre. The Farm adjoins the Great London Road, and is four miles from the Andover Road Station. No applications will be received unless accompanied with satisfactory references.—For particulars, apply to Mr. HUGH RAYNBIRD, Laverstoke, Andover Road, Hants.

GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney, London, begs to solicit the attention of the gentry to his low prices for cash. Good substantial-built Greenhouses, fixed complete, 42 feet long by 13 feet wide, 90*l.*; 21 feet long by 13 feet wide, 50*l.*; 12½ feet long by 10 feet wide, 30*l.* A large assortment of Conservatories, Hothouses, Pits, Melon and Cucumber Boxes, Iron Hand-lights, Summer-houses, Seats, &c. Estimates in the above line, either in wood or iron.

PHOSPHATE NODULES, OR COPROLITES AND FOSSIL BONES (from the Suffolk Crag).—Manufacturers of Superphosphate of Lime can be supplied with the above, either in their natural form or finely pulverised, on the best terms, f. o. b. or delivered in the Thames.

Applications to EDWARD PACKARD, Chemist, Saxmundham, Suffolk, will receive prompt attention.

INTERESTING FACT.—"The following singular and authentic case of restoration of the human hair is worthy of observation, more particularly as it relates to an article of high and universal repute during the last half century. Mr. A. Herrmann, of Queen-street, Soho, had been quite bald for some time past, and had tried various preparations for the recovery of his hair, but without any beneficial result. He was then induced to try the effects of 'ROWLANDS' MACASSAR OIL,' and after daily applying it for about two months, he, much to his gratification, had his hair quite restored, and now possesses a beautiful head of hair. This fact speaks too strongly for itself to require comment."—*Bell's Weekly Messenger.*

ROWLAND'S MACASSAR OIL.

The unprecedented success of this discovery in restoring, preserving, and beautifying the Human Hair, is too well known and appreciated to need comment. For Children it is especially recommended as forming the basis of a Beautiful Head of Hair, and rendering the use of the fine comb unnecessary.

Price 3*s.* 6*d.*—7*s.*—Family Bottles (equal to 4 small), 10*s.* 6*d.*, and double that size, 21*s.* per bottle. N.B. Each bottle of the genuine article has the words ROWLANDS' MACASSAR OIL engraved in two lines on the Wrapper; and on the back of the Wrapper nearly 1500 times, containing 29,028 letters.

Sold by A. ROWLAND and SONS, 20, Hatton-garden, London; and by Chemists and Perfumers.

WHERE TO BUY A DRESSING-CASE.—In no article perhaps is caution more necessary than in the purchase of a Dressing-Case, for in none are the meretricious arts of the unprincipled manufacturer more frequently displayed. MECHI, 4, Leadenhall-street, near Gracechurch-street, has long enjoyed the reputation of producing a Dressing-Case in the most finished and faultless manner. Those who purchase one of him will be sure of having thoroughly-seasoned and well-prepared wood or leather, with the fittings of first-rate quality. The prices range from 1*l.* to 100*l.* Thus the man of fortune and he of moderate means may alike be suited, while the traveller will find the Mechian Dressing-Case especially adapted to his necessities.—4, LEADENHALL-STREET.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St Paul's, Covent-garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, FEBRUARY 2, 1851.

TO "PHARO."—"A Lover of a Gay Flower Garden," and all others, can have their wants supplied, and queries answered, on application to JOHN MAY, who begs to refer all enquirers to his advertisements of the 11th, 18th, and 25th of January last, and also to the 15th and 22d of February, and to-day's *Chronicle*.—Address to W. MAY, the Hope Nuseries, Leeming-lane, Bedale, Yorkshire.

TO CUCUMBER AND MELON GROWERS.

WILLIAM HUSSEY begs to offer the under-named sorts of CUCUMBERS and MELONS in packets, containing Six Seeds, at the following prices:—

| | | |
|---|---|---|
| Cucumbers, Walker's Rambler, black spine | 0*s.* | 8*d.* |
| ,, Mackie's improved black spine | 0 | 6 |
| Melons, Bromham-hall, green flesh | 1 | 0 |
| ,, Emperor, green flesh | 0 | 8 |
| ,, Duncan's, green flesh, improved | 0 | 6 |
| ,, Pine Apple | 0 | 8 |
| ,, Beechwood, green flesh | 0 | 8 |

The above can be had, post free, on receipt of Post-office order, or the amount in penny stamps.

Horticultural Gardens, Norwich, March 1.

CUCUMBER "PHENOMENA," AND "BROMHAM HALL" MELON.

EDWARD TILEY wishes to inform the Nobility, Clergy, Gentry, and Growers in general, that he has still a Stock of good sound Seeds of the above superb CUCUMBER and MELON, and other varieties, as advertised by him in the *Gardeners' Chronicle*, Feb. 22d, 1851. Cucumber Phenomena, 2*s.* 6*d.* per packet; Bromham Hall Melon, 1*s.* 6*d.* ditto; Fleming's Trentham Hybrid Melon, 1*s.* ditto; and about 20 other good varieties of Cucumbers and Melons, at the prices mentioned in the former Advertisement.

Any quantity will be sent postage free on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 12, Abbey Churchyard, Bath.

WILLIAM JACKSON AND CO., beg to offer the following at the reduced prices annexed; all are well grown and well rooted, and are sure to please, their goods having given great satisfaction throughout the kingdom for many years.

| | *s.* | *d.* |
|---|---|---|
| Trained FRUIT TREES, for Walls and Espaliers, correct to name, and of the most useful and approved sorts. | | |

The rarest and most ornamental Coniferæ, all from Seed, handsome plants in pots. Prices and sizes on application.

The Nurseries, Scruton, Bedale, Yorkshire, March 1.

THE NEW EARLY SWEET-KERNELLED KAISHA APRICOT.

MESSRS. VEITCH AND SON feel much confidence in bringing into public notice the above valuable new Syrian Apricot, sent to this country by the late JOHN BARKER, Esq., of Suedia, the gentleman by whom the valuable Stanwick Nectarine was introduced. Having obtained the entire stock, they are now prepared to send out a limited number of healthy Young Trees at the following prices, and solicit the favour of early orders, which ensure good trees and meet with immediate attention.

Healthy one year old Trees ... 21*s.* 0*d.*
,, one year trained ... 31 6
,, two year trained ... 42 0
} package included.

A few two year old trained, chiefly half-standards and standards ... ... ... ... 42*s.* each.

One plant over to the Trade when three are taken.

In offering the above valuable new early Apricot for sale, Messrs. VEITCH and SON beg to refer to the description given by Dr. LINDLEY, in the "Journal of the London Horticultural Society," for July, 1849, from which the following extract is given:

"The fruit semi-transparent, roundish, 5½ inches in circumference, skin slightly downy, pale citron-coloured where shaded, tinged and marked with red next the sun. Flesh tender, juicy, of a clear citron colour, parting freely from the stone, *sugary and delicious*, like well refined lump sugar combined with Apricot flavour; stone *small*, roundish; kernel sweet like a nut. A valuable early variety for the dessert, and probably excellent for preserving; if it be employed for this purpose, the transparency of its flesh will exhibit a new feature amongst Apricot preserves. Some of the fruits have ripened as early as the 12th of July, and on the *same wall* at the time were Moorpark and Turkey Apricots perfectly green and hard."

Exeter, March 1.

JOHN CATTELL, NURSERYMAN and SEEDSMAN, Westerham, Kent, has the following desirable Plants, very cheap, now ready to send out (those marked thus * J. C. can supply in large quantities to the trade very liberally), viz.:—CALCEOLARIAS, fine show varieties, at 2*s.* 6*d.* each; Madame Merric, Emperor, Supreme, Masterpiece, Standishii, Mr. Wilcke, and Beauty Supreme, Ditto Bedding varieties, Kentish Hero *, and Intermedia, at 6*s.* per doz.; Cattell's Hero, 3*s.* 6*d.*

Tigridia pavonia *, 2*s.* per doz.; Ditto, Conchiflora *, 2*s.* 6*d.* per doz.; Delphinium Barlowii *, and grandiflora maximum, 8*s.* per doz.; Œnothera macrocarpa *, 8*s* per doz.; Anemone pavonia, fine scarlet, now coming into flower, 6*s.* per doz.; Gladiolus Brenchliensis, 2*s.* each; Ditto, Gandavensis, 6*s.* per doz.; Geranium "Flower of the Day," very strong, 10*s.* 6*d.* each; also a fine stock of clean healthy plants of most of the leading sorts of Florist, Fancy, Scarlet, Pink, and other Geraniums, Dwarf Rose Geant des Batailles, on their own roots, or budded, at the purchaser's option, 2*s.* each, or 18*s.* per doz.; Cedars of Lebanon, from 5 to 6 feet, in large pots, 10*s.* 6*d.* to 15*s.* each.—N.B. No Goods sent from this Establishment to unknown correspondents without a remittance or reference.

AMERICAN PLANTS.

C. LODDIGES AND SONS, in consequence of part of their Nursery being given up for building, are enabled to offer for cash—

Finest Ghent Azaleas, strong bushy plants named, and being well set with buds, are peculiarly adapted for forcing, 18*s.* per doz.

Azalea pontica, large, 12*s.* per doz.
Andromeda floribunda, 3 to 4 feet across, 10*s.* each.
Vacciniums, 30 species, 12*s.* per doz.
Andromeda Ditto 24*s.* per doz.

Post-office Orders to be made payable at Hackney, near London.

CAMELLIA STOCKS FIT FOR IMMEDIATE WORK.

RENE LANGELIER, Clarendon Nursery, St. Helier, Jersey, begs to inform the Public that he has a very extensive stock of the above, fit for immediate grafting, very clean and healthy, well rooted, so as to leave without the pot, consequently much less expense in conveying to any distant place. Price 36*s.*, 40*s.*, and 50*s.* per 100.

The Stock is such as has never before been offered to the Public by any grower.

R. L. has a most extensive collection of Double Camellias at a very moderate rate and reduced price, as will be seen by a Catalogue recently published, in which it is proved that they can stand the climate out-of-doors without protection. The Catalogue can be had of R. L. by inclosing four penny stamps. Remittance or reference from unknown correspondents.

DICKSONS AND CO., NURSERYMEN, SEEDSMEN, and FLORISTS, Leith Walk, beg to call the attention of Landed Proprietors and others to their very extensive stock of FOREST TREES. Their collection of Fruit Trees is also very extensive, comprising all the most approved varieties lately introduced. Catalogues of Greenhouse Plants, Calceolarias, Pansies, &c., are in course of publication.

Seed Warehouse, 1, Waterloo-place, Edinburgh, March 1.

ESTABLISHED 1786.

WILLIAM E. RENDLE AND CO., SEED MERCHANTS by special appointment to the SOUTH DEVON AGRICULTURAL ASSOCIATION, and several influential Members of the Royal Agricultural Society, Union Road, Plymouth.

We have this season a choice and well assorted Stock of all the best FARM SEEDS. They have been grown and selected with the greatest care, and can be highly recommended as being of the most genuine quality. Our sale of Turnip Seeds alone last season exceeded *one thousand bushels*; our extensive dealings therefore enable us to sell at the lowest remunerating prices, and at the same time is the strongest evidence we can offer of the large and increasing patronage bestowed upon us, for which we have to return our most grateful acknowledgments.

OUR DESCRIPTIVE CATALOGUE OF FARM SEEDS *is just published, and can be had in exchange for One Penny Stamp. It contains a description of all the best varieties of Turnips, Carrots, and Mangold Wurzel, with prices affixed to every article. The list of Grasses is peculiarly comprehensive, and contains short descriptions of all the leading kinds. There is also some useful advice relative to the sowing of Grass Seeds for permanent pasture, concerning which* Mr. KEMP, *of Birkenhead Park, in a letter to us says:—"I am glad that you repudiate the practice of sowing Corn with Grass Seeds, a custom I have often had to combat."*

All Orders above 2*l.* Carriage Free. (See Catalogue.)

Apply to WILLIAM E. RENDLE and Co., Seed Merchants, Plymouth.

NEW AND CHOICE FLOWER SEEDS, GERMAN STOCKS, GERMAN ASTERS, &c.

J. C. WHEELER AND SON, NURSERYMEN and SEEDSMEN, by Official Appointment, to the Gloucestershire Agricultural Association, 99, Northgate-street, Gloucester, have selected, out of a large collection of Flower Seeds, 20 of the most beautiful and showy varieties, each sort distinct in colour, and calculated to produce a fine effect when planted out in beds or groups in the flower border. Each variety is distinctly marked with its Botanical and English name, height, time of flowering, colour of the flower, manner of growing, whether erect or trailing, &c., &c., the time it should be sown, and other valuable hints as to its cultivation. In selecting these 20 varieties, care has been taken to exclude all which are shy-bloomers, or have an insignificant appearance; so that the collection will comprise only those which are really showy and handsome, and which, it is believed, would prove to the entire satisfaction of any lady or gentleman who might be disposed to order them. The German Stocks and Asters especially are most superb.—The 20 Packets are neatly packed up in one paper, and will be sent free by post, to any part of the Kingdom, for 5*s.*

SUPERIOR GARDEN SEEDS, CARRIAGE FREE.
(All of home growth.)

KITCHEN-GARDEN SEEDS, including all the New Sorts yet introduced, as advertised in previous Numbers of the *Gardeners' Chronicle*; and FLOWER SEEDS as under:—

The best sorts of imported Asters, Zinnias, Stocks, Larkspurs, Marigolds, Phloxes, &c., in complete collections for a large garden ... ... ... ... £1 1 0
Ditto, in smaller quantities ... ... ... ... ... 0 10 6
Ditto, for a small garden ... ... ... ... ... 0 7 6

Instructions for Cultivation will accompany the Flower Seeds.

JOHN SUTTON and SONS, Reading, Berks.

HUGH LOW AND CO. have to offer fine large Tubers of the under-named Tropæolums:—

| | | | |
|---|---|---|---|
| Azureum ... ... | 5*s.* 0*d.* | Edule ... ... | 7*s.* 6*d.* |
| Brachyseras ... | 1 6 | Tricolorum ... | 1 6 |

Prices to the Trade on application.—Clapton Nursery, London.

SEEDLING LARCHES.

WILLIAM WOOD AND SON having on hand a very extensive stock of the above in fine condition, beg to offer them as under.

One year seedling Larch, at 1*s.* 3*d.*, 1*s.* 6*d.*, and 1*s.* 9*d.* per 1000.
Two year ditto, 3*s.* to 3*s.* 6*d.* per 1000.
One year seedling Alder, 3*s.* 6*d.* per 1000.
One year seedling Ash, 2*s.* 6*d.* per 1000.
Two year ditto, 3*s* 6*d.* per 1000.
One year seedling Birch, 2*s.* per 1000.

TRANSPLANTED.

Larch, 12 to 15 inches, 7*s.* 6*d.* per 1000.
Scotch Fir, 1 to 2 feet, 12*s.* 6*d.* per 1000.
Birch, 3 to 4 feet, 30*s.* per 1000.
Do., 4 to 5 feet, 35*s.* per 1000.
Thorns at reduced prices.

With every other kind of Forest Trees equally cheap.
Woodlands Nursery, Maresfield, near Uckfield, Sussex.

TO GENTLEMEN ENGAGED IN PLANTING.

GEORGE JACKMAN has to offer a large and well-grown Stock of the following at very low prices, which can be had on application.—Beech, 4 to 5 ft.; Chestnut, Spanish, 2 to 3 ft.; Ditto ditto, 3 to 4 ft.; Elms, English, 4 to 5 ft.; Fir, Larch, 2 to 3 ft.; Ditto ditto, 3 to 4 ft.; Ditto, Spruce, 2 to 3 ft.; Ditto ditto, quartered, 4 to 7 ft.; Ditto, Silver, 1 to 3 ft.; Hazel, 2 to 3 ft.; Ditto, 4 to 5 ft.; Hornbeam, 4 to 5 ft.; Oaks, English, 4 to 5 ft.; Ditto, Scarlet, 2 to 3 ft.; Quicks, strong bedded.

Woking Nursery, March 1.

MESSRS. STANDISH AND NOBLE have to offer the following very desirable plants:

AZALEA INDICA, "GLORY OF SUNNING-HILL."—In general appearance this plant, when in bloom, reminds one of Nerium splendens, producing large double rose-like flowers of the richest pink; good plants, 3*s.* 6*d.* to 10*s.* 6*d.* each.

CRYPTOMERIA JAPONICA SEEDLINGS.

2 years ... ... ... ... 18*s.* per doz., or 105*s.* per 100.
3 years ... ... ... ... 30*s.* ,, 210*s.* ,,
1 foot 6 inches to 2 feet 6 inches high, 60*s.* per dozen.
2 feet 6 inches to 3 feet 6 inches high, 90*s.* ,,
3 feet 6 inches to 4 feet 6 inches high, 126*s.* ,,
And larger plants in proportion.

The whole of the above, with the exception of the two years seedlings, were planted into the open border last spring, are fine robust specimens, and fit for immediate planting.

CRYPTOMERIA JAPONICA, var. NANA, a very singular dwarf variety, 10*s.* 6*d.* to 21*s.*

CUPRESSUS FUNEBRIS, or WEEPING CYPRESS, (North of China.)

6 inches high, 10*s.* 6*d.* each; 12 to 15 inches, 21*s.* each.

These plants are from the open border—robust specimens fit for immediate planting.

15 ins. to 24 ins., 31*s.* 6*d* each; 24 ins. to 30 ins., 42*s.* each.

CUPRESSUS GOVENIANA. (California.)

6 to 9 inches, 7*s.* 6*d.* each; 9 to 15 inches, 10*s.* 6*d.* each.
15 to 24 inches, 21*s.* each; 2 to 3 feet, 31*s.* 6*d.*

CUPRESSUS LAMBERTIANA, 2 feet, 3*s.* 6*d.* each.

CUPRESSUS THURIFERA, var. ELEGANS, perfectly hardy. 1 foot to 2 feet high, 3*s.* 6*d.* to 5*s.* each.

CEPHALOTAXUS FORTUNII, strong plants, 31*s.* 6*d.* each. For description, see "Botanical Magazine," by Sir W. Hooker.

FORSYTHIA VIRIDISSIMA.

1 foot 6 inches to 2 feet ... ... 1*s.* 6*d.* to 2*s.* 0*d.* each.
2 feet to 3 feet ... ... ... ,, 2*s.* 6*d.* ,,
3 feet to 4 feet ... ... ... 3*s.* 6*d.* ,, 5*s.* 0*d.* ,,

Fine bushy plants from open border fit for immediate planting.

JASMINUM NUDIFLORUM ... ... 1*s.* 0*d.* each.
Flowering plants ... ... ... 3*s.* 6*d.* ,,

This is a very desirable winter flowering hardy plant, producing a profusion of flowers of the richest yellow from December to February.

QUERCUS SCLEROPHYLLA. (North of China.) This is undoubtedly the most remarkable of all evergreen Oaks, having foliage as large as the Spanish Chestnut, and more than twice the substance. Strong seedling plants, 42*s.* each.

QUERCUS INVERSA. (North of China.) Also evergreen, with smooth entire leaves, having remarkably large male inflorescence. Seedlings, 42*s.*

FORTUNE'S YELLOW ROSE, a distinct species, admired by all who have seen it. It would be impossible to describe the combination or richness of the bronze and yellow tints which the flowers present. It is an excellent pillar Rose, and its foliage is distinct. It blooms freely, and in general habit resembles Rugæ. warfs, 5*s.*; Standards, 10*s.* 6*d.* each.

TAXODIUM SEMPERVIRENS.

1 foot to 1 foot 6 inches ... ... 2*s.* to 2*s.* 6*d.* each.
1 foot 6 inches to 2 feet 6 inches ... 3*s.* 6*d.* to 5*s.* ,,
3 to 4 feet ... ... ... ... 7*s* 6*d.* to 10*s.* 6*d.* ,,

Larger in proportion.

# EXHIBITIONS AT THE GARDEN

OF THE

# HORTICULTURAL SOCIETY OF LONDON,

FOR THE YEAR 1851.

## THE EXHIBITIONS WILL TAKE PLACE ON THE FOLLOWING SATURDAYS:

MAY 3, JUNE 7, AND JULY 19.

## SCHEDULE OF THE PRIZES.

## FLOWERS.

*(Pots are to be measured inside, one inch below the rim.)*

### Division I.—IN WHICH NURSERYMEN AND PRIVATE GROWERS EXHIBIT INDEPENDENTLY OF EACH OTHER.

1. Pelargoniums; in collections of 12 new and first-rate varieties, with perfectly distinct colours, cultivated with superior skill, in 8-inch pots. SG—CE—LS.
   N.B. The collections in which the varieties are most distinct *will have the preference.*
2. Pelargoniums; in collections of 9 varieties, in 11-inch pots. SG—CE—LS.
   N.B. Any plant that shall not have been actually grown in 11-inch pots will be disqualified.
3. Fancy Pelargoniums; in sixes, in 8-inch pots. CE—LS—SK.
4. Roses, in pots; in collections of 12 distinct varieties, in 13-inch pots. GB—SG—CE. *(In May and June only.)*
   N.B. The Judges will disqualify any collection that shall be found to contain a plant which has been recently placed in the pot from the open ground, or that is shown in a pot of any other size than 13 inches.
5. Yellow Roses, best six varieties. SK—SB—C. *(In June only.)*
   N.B. To be really yellow; pale-cream colours are inadmissible.
6. Cape Heaths; in collections of 10 entirely distinct varieties. GB—SG—CE.
   N.B. It is expected that the same plant shall not be exhibited on more than one occasion. The Judges, in making their award, will give, both in this and the next number, a marked preference to plants grown in their natural forms, without stakes or stays; and will also take distinctness of species into favourable consideration. No duplicate will be allowable.
7. Cape Heaths; in collections of 10 entirely distinct varieties, in 11-inch pots. SG—CE—LS.
8. Carnations, in collections of 12 distinct varieties, in 11-inch pots. CE—LS—SK. *(In July only.)*
9. Picotees, in collections of 12 distinct varieties. CE—LS—SK. *(In July only.)*
10. Pinks; in collections of 12 distinct varieties. SK—SB—C. *(In June only.)*
    N.B. Carnations, Picotees, and Pinks can only be shown as perfect plants grown in pots. Cut flowers in boxes will no longer be received.
11. Calceolarias, in twelves; in 11-inch pots. LS—SK—SB.
    N.B. No medals are to be awarded unless the plants are in very high health and extremely well grown. *(In May and June only.)*

### Division II.—IN WHICH NURSERYMEN ALONE CAN SHOW.

12. Exotic Orchids; in collections of 15 species of superior cultivation. GB—SG—CE.

### Division III.—IN WHICH ALL PERSONS ARE ADMITTED TO EQUAL COMPETITION.

13. Single specimens of very superior cultivation, excluding everything which can be shown singly in other numbers, and plants not in flower. CE—LS—SK
14. Stove or Greenhouse plants; in collections of 20 plants. LG—GK—GB.
    N.B. Calceolarias, Fuchsias, Orchids, Pelargoniums and duplicates are excluded from all the four classes of Stove and Greenhouse plants. Only three species or varieties of the same genus can be allowed in this and the following number.
15. Stove or Greenhouse plants; in collections of 15 plants. GK—GB—SG.
16. Stove or Greenhouse plants; in collections of 10 plants. GB—SG—CE.
    N.B. Only two species or varieties of the same genus can be allowed in this number.
17. Stove or Greenhouse plants; in collections of 6 plants. SG—CE—LS.
    N.B. Not more than one species or variety of the same genus can be allowed in this number. No one can show in more than one of the classes of Stove and Greenhouse plants.
18. Greenhouse Azaleas in 12 distinct varieties. GB—SG—CE.
19. Greenhouse Azaleas; in 12 of the newer kinds, in 8-inch pots. SG—CE—LS.
20. Greenhouse Azaleas; in 6 distinct varieties. SG—CE—LS.
    N.B. No one can show in more than one class of Azaleas.
21. Indian Rhododendrons, and their hybrids; in 12 distinct varieties. GB—SG—CE. *(In May only.)*
22. Cape Heaths; in sixes, grown in 8-inch pots. CE—LS—SK.
23. Exotic Orchids; in collections of 20 species of superior cultivation. LG—GK—GB.
24. Exotic Orchids; in collections of 10 species of superior cultivation. GB—SG—CE.
25. Exotic Orchids; in collections of six species. SG—CE—LS.
    N.B. Nurserymen cannot show in either of these three classes of Orchids. No exhibitor can show in more than one of them.
26. Exotic Orchids; single specimens displaying *very* superior cultivation. SK—SB—C.
    N.B. No duplicate Medals can be here awarded.
27. Fuchsias; in threes, of three distinct colours. LS—SK—SB *(In July only.)*
28. Pelargoniums; in six DISTINCT SPECIES, exhibiting superior cultivation. CE—LS—SK.
    N.B. By the word species is meant the wild kinds imported from the Cape of Good Hope, or New Holland, tuberous species inclusive, and not garden cross-breds.
29. Achimenes; in collections of six distinct varieties, exhibiting superior cultivation. CE—LS—SK. *(In July only.)*
30. Tall Cacti; six distinct varieties in flower. SG—CE—LS.
31. Roses of 50 varieties in loose bunches, each consisting of three trusses as they are gathered, so as to exhibit, as far as possible, the habit of the variety. CE—LS—SK. *(In July only.)*
    N.B. No one who exhibits in this number can also compete in the following.
32. Roses, exhibited as in No. 31, and in 25 varieties. LS—SK—SB. *(In June and July only.)*
    N.B. Private growers only can exhibit here. If Roses are brought for exhibition without attention to the regulations here explained, they will not be allowed to compete.
33. Helichrysums. CE—LS—SK.
34. Calosanths; in sixes. LS—SK—SB. *(In July only.)*
35. Statices; in collections of six species. CE—LS—SK.
36. Ferns, in collections of 10 hothouse species of very superior cultivation. LS—SK—SB. *(In July only.)*
37. New Hybrid Plants, exclusive of Roses, Rhododendrons, Azaleas, and garden cross-breds, such as Gloxinias and the like. SG—CE—LS.
    N.B. It is certain that much may be effected by hybridising plants in common cultivation, such as Lilacs, Honeysuckles, &c. &c. This class will be judged by the Society's officers.
38. Epacrises; in sixes. CE—LS—SK *(In May only.)*
39. Newly introduced or extremely rare ornamental plants in flower, not introduced by the Society. SG—CE—LS.
    N.B. These Medals will be awarded by the Society's officers, and not by the usual Judges. Exhibitors will particularly observe that none but new or rare plants can be exhibited under this number. *Nothing will be regarded as new which has been exhibited in the Garden or Regent-street in a previous season,* nor garden seedlings, hybrids, nor domesticated varieties of any kind. No prizes will be given to New Plants which have been introduced through the Society.
40. Miscellaneous subjects, exclusive of Ferns. SK—SB—C.
    N.B. Exhibitors under No. 40 will not be thereby *entitled* to a pass ticket. Cockscombs, Heartsease, Hydrangeas, and bouquets, together with all plants for which separate prizes are offered as single specimens, are altogether excluded from this number.
41. Seedling Hybrid Pelargoniums, of entirely new crosses. SB—C.
    N.B. Every seedling must be shown singly, and marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. The plants must be shown in pots, and not in a cut state.
42. Pansies; in twelves, in 8-inch pots. SK—SB—C.
43. Alpines; in twelves. SK—SB—C.
44. Cinerarias; in sixes, in 8-inch pots. SK—SB—C. *(In May only.)*
    N.B. Prizes will only be given to extremely fine specimens.
45. Seedling Florists' Flowers.
    A tent will be provided for the exhibition of these; but no medals will be awarded, *nor will they be entered.* The exhibitors will themselves mark their seedlings in their own way. The Society declines to express any opinion upon the merits of seedlings.

## FRUIT.

Market Gardeners, or Growers (not Fruiterers), in the habit of supplying the Market, and Private Gardeners, exhibit independently of each other. Fruiterers are not allowed to exhibit at all. No duplicate awards can be made in any case whatever, except in **O** and **P**. No person can take more than one award in each Letter, except in **B, D, I, L, O, P.**

N.B. All Fruit must be sufficiently ripe for Market, WELL COLOURED, and PROPERLY NAMED by the Exhibitor, as far as practicable; if the contrary, it will be disqualified.

**A** Collections of Fruit. GK—GB—SG *in May.* GB—SG—CE *in June.* SG—CE—LS *in July.*
N.B. No person receiving a prize for a collection, can also receive a prize for any separate exhibition of fruit.

**B** Pine Apples, in single specimens:—
1. Queens. LS—SK—SB.
2. Enviles, Cayennes, Sugarloafs, Black Jamaicas, Otaheites, &c. LS—SK—SB.
3. Providences. LS—SK—SB.

**C** Grapes in pots; three specimens to be shown. CE—LS—SK.

**D** Grapes; in three bunches for private growers, and six bunches for Market Gardeners:
1. Black Hamburgh. LS—SK—SB.
2. Black Prince, or West's St. Peters. LS—SK—SB.
3. White Muscadines, or Sweetwaters. LS—SK—SB.
4. Muscats. LS—SK—SB.
5. Frontignans, or other sorts, distinct from the foregoing. LS—SK—SB.

**E** Peaches, in sixes. SK—SB—C.

**F** Nectarines, in sixes. SK—SB—C.

**G** Apples and Pears of the previous year. SB—C.

**H** Figs, in sixes. SB—C.

**I** Cherries, in dishes of 1lb. each:
1. Black. SB—C. 2 White. SB—C.

**K** Strawberries, in pots; six pots to be shown. SK—SB—C.
N.B. They must have grown in the pots in which they are shown.

**L** Strawberries, one dish each:
1. British Queen, and similar kinds. SB—C.
2. Keens' Seedling, and similar kinds. SB—C.
3. Other kinds. SB—C.

**M** Oranges, Citrons, &c., in pots; no one to show more than one pot. LS—SK—SB.
N.B. This class of Fruits is excluded if gathered.

**N** Melons, one specimen each, for the best flavoured. SK—SB—C.

**O** New varieties of any of the preceding kinds of fruit.

**P** Other kinds of fruit of peculiar excellence and value.
N.B The medals under this and the preceding letter will be given at the discretion of the Society's officers.

## PRIVILEGE OF FELLOWS.

Each Fellow of the Society has free personal admission to these Exhibitions without a Ticket. He may also personally introduce a Friend with an "Admission Ticket," at half-past Twelve, at Gate No. 4, in the Duke of Devonshire's Road; or, if unable to attend personally, his wife or sister may represent him, provided she is herself furnished with an "Admission Ticket" to which his signature is subscribed.

## ADMISSION OF VISITORS.

The Garden will be opened, on each day, to the Public, at TWO o'clock, under the following Regulations:—

All Fellows of the Society will be admitted without tickets, from TWO till Six o'clock, on signing their names in a book at the entrance.

Visitors can be admitted only by tickets, to be obtained by the personal or written orders of Fellows of the Society. The Council trust that Fellows of the Society will not give orders for tickets to persons with whom they are unacquainted.—N.B. *The presentation of the visiting card of a Fellow of the Society cannot be regarded as an authority to receive tickets.*

All Fellows who shall apply, on or before SATURDAY, the FIFTH of April, may obtain, at the rate of Three Shillings and Sixpence each, any number of tickets not exceeding FORTY-EIGHT; but no application for such tickets will be received after that day. *Fellows of the Society subscribing for tickets at this price will be allowed a clear week from the* FIFTH *of April, during which they may claim them.* AFTER THAT PERIOD ALL THE *3s. 6d.* TICKETS SUBSCRIBED FOR, BUT NOT ISSUED, MAY BE CANCELLED.

After the FIFTH of April, any further number of tickets will be delivered to Fellows on their personal application or written order, at the price of *Five Shillings* each ticket.

Each ticket will be available for the admission of one Visitor, after TWO o'clock, to either of the Three Exhibitions, at the option of the Visitor.

All applications for tickets must be made at the Society's Office, 21, Regent-street.

NO TICKETS WILL BE ISSUED IN REGENT-STREET ON THE DAYS OF EXHIBITION. On those days two Offices, near the Garden Gates, will be opened at ONE o'clock for the issue of tickets at *7s. 6d.* each; but still under the regulations above stated.

PERMANENT PASTURE.

HENRY ROGER SMITHE, of Eastling, Faversham, Kent, informs the Public that his mixtures of the Natural Grasses and small Clovers—excluding no sort which is proper to form a PERMANENT PASTURE, as the soil &c. may direct—are now ready; delivered on the railway free of charge, at 1*l.* per acre, allowing 3 bushels as seed for an acre; also Lawn Mixtures, and the sorts separate. They are gathered under his immediate superintendence, and are quite new; this unprecedented low price last year, and the prospects of agriculture, having created an unlooked-for demand.

RARE AND BEAUTIFUL COLUMBINE.—The Subscribers have for Sale strong Roots of AQUILEGIA GLANDULOSA, sent free by post at *2s. 6d.* per pair, or *9s.* per dozen, and Seeds at *1s.* per packet, or for stamps of that value. Respecting this beautiful flower, Dr. LINDLEY, in the *Gardeners' Chronicle*, says, "This plant is perhaps the handsomest hardy perennial in cultivation;" and having described it he adds, "No description that we have formerly given of it has done justice to its exquisite appearance." The trade supplied at the wholesale rate.

JOHN GRIGOR and Co., Nurseries, Forres, N.B.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK invites attention to the fact that there is a regular and steady demand for SLATE TUBS for Orange Trees, Camellias, and Ornamental Plants, their superiority over all others being proved by this fact, and their extensive use in the Royal Gardens, Kew.

E. B. will be glad to forward a printed description in answer to all applications.

All articles in Slate manufactured by E. B. may be seen extensively in use at Worton Cottage, on application to the gardener, Sundays excepted.

TO NURSERYMEN.

WANTED, the Price per 1000 of Common Ivy, Hypericum calycinum, Periwinkle, Berberis aquifolium, or similar plants, that will cover ground rapidly.

Apply by letter, post paid, to J. M'H., at the Office of this Paper.

TO POTATO AND CUCUMBER GROWERS.

JAMES LAKE, NURSERYMAN, &c., Bridgewater, Somerset, begs to inform the Public that he is now ready to send out his Seedling FIFTY-FOLD KIDNEY POTATO, which has been proved and highly recommended by Dr. Lindley, Messrs. Beck and Henderson, Hurst and M'Mullen, and many others. Price 4s. per peck.

London Agent: Hurst and M'Mullen, 6, Leadenhall-street.

J. L. having grown from 15 to 20 lights of Aban's Conqueror of the West CUCUMBER successfully for three years, can with confidence recommend it to the Public as being one of the best kinds in cultivation. Packets containing 12 seeds, 1s. each.

SEEDLING SCOTCH FIRS.—The Subscribers have to offer to the trade a few hundred thousand 2-year SEEDLING SCOTCH FIRS, the produce of seed from Strathspey natural Forests. Price moderate.

HOWDEN, Brothers, Muirtown Nurseries, Inverness.—March 1.

*** There is direct steam communication from Inverness to London, Glasgow, and Edinburgh.

BEAUTIFUL, USEFUL, AND CHEAP!
WARRANTED TO PLEASE.

The following COLLECTIONS of SEEDS and PLANTS are deserving especial notice, and are important to all who have a Garden.

No. 1.—100 varieties of HERBACEOUS PLANT SEEDS, hardy PERENNIALS, comprising the most select and beautiful sorts from our unrivalled Collection—never before offered—purchaser's selection, free by post, 1*l.* 5*s.*

No. 2.—50 varieties fine do., purchaser's selection, 15*s.*

No. 3.—25 do do., 8*s.*

A list containing height, colour, and time of flowering, with much other useful information relative to their culture, may be had on application.

ANNUAL FLOWER SEEDS—post free.

No. 4.—100 vars. purchaser's selection, from list containing the newest and showiest sorts of hardy, half-hardy, and tender Annuals, 18*s.*

No. 5.—50 vars., purchaser's selection, 10*s.*

No. 6.—25 do. do., 8*s.*

Or we shall be happy to make selections for purchasers of the quantities at the above prices. The Annuals will be contained in Ayres and Moore's descriptive cultural labels.

The following are WARRANTED GENUINE, and are very superior:

HOLLYHOCK, from a most superb Collection of named double flowers, per packet, 1*s.*

CINERARIA, from the newest and best show flowers of 1850 per packet, 1*s.* 6*d.*

CALCEOLARIA, do. do., splendid, per packet, 2*s.* 6*d.*

PANSY, do. do. do., per packet, 1*s.*

PETUNIA, do. do. do., per packet, 1*s.*

N.B.—The above five unique lots may be had separate, or if required will be included in Collection No. 1. They have all been collected from our own plants and purchasers may rely with confidence on their quality.

GREENHOUSE PLANTS.

ERICAS, 50 fine healthy plants, most of them large enough to bloom the coming season, and all ready for growing into specimens. Purchaser's selection from list, in 50 superb varieties, for 3*l.* 10*s.*; or per doz., 21*s.*

ERICAS, 50 finest vars. as above; large plants, own selection, for 2*l.* 10*s.*; or 15*s.* per doz. In the above Collections will be found all the leading sorts of the day, selected with the greatest care for beauty and display.

MISCELLANEOUS GREENHOUSE AND STOVE PLANTS.

50 superior varieties, purchaser's selection, comprising the handsomest species and varieties of all the leading kinds, for 3*l.* 10*s.*, or 21*s.* per dozen.

50 varieties as above, own selection, 2*l.* 10*s.*, or 15*s.* per doz.

CHINESE AZALEAS.—20 fine varieties, purchaser's selection, for 25*s.*, or 13*s* per doz.

20 do. do., own selection, for 21*s.*, or 15*s.* per doz.

ROSES.—50 splendid sorts Standards, own selection, per 100, 5*l.*; or 18*s.* per doz.

100 fine varieties, Dwarfs, in 100 sorts, 2*l.* 10*s.*; or 9*s.* per oz., own selection.

CALCEOLARIAS.—Fine healthy, established Plants from the most eminent growers, per doz., 3*s.*, own selection, of best sorts. When the selection is left to ourselves purchasers are desired to furnish lists of such plants, seeds, &c., as are already in their collections, that duplicates of any article may not be sent, every wish will be strictly complied with.

HOLLYHOCKS, No. 1, fine double named kinds, all shades of colour, 9*s.* per doz., or 2*l.* 10*s.* per 100. HOLLYHOCKS, No. 2, for border display, very good, 6*s.* per doz., or 1*l.* 10*s.* per 100. These are selected out of some hundreds of seedlings, and may be confidently relied on.

HERBACEOUS PLANTS.—Purchaser's selection, from List, per 100, 3*l.* 3*s.*

W. MAY's selection, extra fine, No. 1, 2*l.* 2*s.* per 100;
" " really good, No. 2, 1*l.* 10*s.* "

Having an immense stock they can be furnished at these low prices. The collection extends over 700 species and varieties selected from the choicest stocks in the country (regardless of expense) for display, and warranted second to none. To meet our customers in every way, we hope to be favoured with lists of such plants as are already in their collections, that duplicates of any articles may not be sent where the selections are left to ourselves.

FLOWERING SHRUBS AND ORNAMENTAL TREES.—The finest varieties, purchaser's selection, from the list, per 100, 3*l.* 3*s.*

W. MAY's selection, No. 1, extra fine, per 100, 2*l.* 2*s.*
" " No. 2, good kinds, " 1*l.* 5*s.*

This Nursery has long held high celebrity for possessing a most splendid stock of flowering shrubs, extending over upwards of 600 species and varieties of the choicest kinds. Some hundreds were selected by Mr. E. KEMP, for the Park at Birkenhead; and for correctness of naming, quality, and health, not excelled by any.

To gentlemen forming Arboretums, or making extensive Ornamental Shrubberies, this is an opportunity seldom offered.

COMMON LAURELS, 1½ to 2 feet, per 1000, 4*l.*; or per 100, 10*s.*, fine healthy stuff; 2 to 3 feet, bushy, extra fine, per 1000, 5*l.*—per 100, 15*s.*

GOOSEBERRIES, all the finest Lancashire show sorts, per 1000, 4*l.*, in 100 varieties, or 10*s.* per 100 in 50 varieties; the stock extends over 30,000; and is very fine and healthy.

CURRANTS.—White, Red, and Black, including Black Naples, per 100, 10*s.*, fine.

Catalogues may be obtained on application, and the fullest information will be given. Apply to JOHN MAY, to whom all Post-office orders must be made payable. Orders above 5*l.* carriage paid to London, or within 150 miles of the Nurseries. Address WILLIAM MAY, Hope Nurseries, Leeming-lane, Bedale, Yorkshire.

BECK'S SEEDLING PELARGONIUMS AND THE BEST OF OTHER RAISERS' VARIETIES. Fine plants, ready for shifting into large pots; twelve for two guineas, including carriage to London and the packing-case. This is the proper time for purchasers to procure them. Catalogues may be had on application to J. DOBSON, Wortoncottage, Isleworth, Middlesex. The stock was never finer, and purchasers may rely on the best selection being made for them, if they cannot choose for themselves.

HEATHS AND OTHER PLANTS FOR EXHIBITION.

WILLIAM JAMES EPPS begs to state that he has for sale the finest Stock of Young HEATHS and other Greenhouse and Stove Plants possible, which will make splendid specimens in a short time. The superior character of Plants sent out from this Establishment is justly admitted by all who have purchased. The magnificent specimens of Heaths, &c., exhibited by him last season at the Exhibitions at Chiswick and the Royal Botanic Gardens, London, where he received the highest awards, fully justify the foregoing remarks.

Strong bushy Plants can be had at the following low prices, exclusive of packing, carriage paid to London:

| | £ | s. | d. |
|---|---|---|---|
| 100 fine varieties of Heaths ... ... | 5 | 0 | 0 |
| 50 ditto ditto | 2 | 12 | 6 |
| 25 ditto ditto | 1 | 10 | 0 |
| 100, including all the finest varieties of ditto ... ... ... | 7 | 10 | 0 |
| 50 ditto ditto | 4 | 0 | 0 |
| 25 ditto ditto | 2 | 2 | 0 |

| | £ | s. | d. |
|---|---|---|---|
| 100 fine vars. of Stove and Greenhouse Plants ... ... | 5 | 0 | 0 |
| 50 ditto ditto | 2 | 12 | 6 |
| 25 ditto ditto | 1 | 10 | 0 |
| 100 newest and finest vars. of ditto ... | 7 | 10 | 0 |
| 50 ditto ditto | 4 | 0 | 0 |
| 25 ditto ditto | 2 | 2 | 0 |

All the new leading kinds of Geraniums and Cinerarias 12*s.* to 21*s.* per doz.

Catalogues of the above may be had on application.

Bower Nurseries, Maidstone.—March 1.

MITCHELL'S MATCHLESS WINTER PARSLEY, Extra Superior for Garnishing.—J. M. having a quantity of new Seed to dispose of, can highly recommend it to Market and Gentlemen's Gardeners as the hardiest and best winter sort ever produced. Retail price, 2*s.* 6*d.* per lb. Also, his superior dark-green Savoy, 1*s.* 6*d.* per lb. A liberal allowance made to Seedsmen.—Post-Office Orders made payable to JOHN MITCHELL, Ponder's End, Enfield, Middlesex.

CLEMATIS TUBULOSA, FROM MONGOLIA.

HUGH LOW AND Co. having a considerable stock of the above-named beautiful free flowering, hardy, suffruticose plant, producing splendid masses of purple flowers during the autumn months, offer strong plants at 1*s.* 6*d.* each, or 12*s.* per dozen.

They also have for sale very fine, healthy bushy plants of CITRUS JAPONICUS, or as it is commonly called, OTAHEITE ORANGE. Wherever this plant is known, it is universally admired, on account of the facility with which it can be made to produce fruit in abundance in a very small state. Price 42*s.* per dozen.—Clapton Nursery, London.

LIBOCEDRUS CHILENSIS, Endlicher (THUJA CHILENSIS, Don).—A noble Evergreen Conifer, a native of the Andes of Chili and the southern provinces of Antucco and Valdivia, growing to the height of 65 to 80 feet. Sir Wm. Hooker says—

"*It is a tree of great beauty, and well worthy of being introduced into our gardens. There can be little doubt, from its native regions (inhabiting the same elevations on the mountains as the Araucaria imbricata), that it will thrive well in the open ground.*"

The following is an extract from a letter lately received from the well known botanical collector Mr. Bridges:—"In one of the late numbers of the *Gardeners' Chronicle* I see some doubts expressed relative to the Thuja Chilensis being hardy in England. It will, in my opinion, be perfectly so, judging from what I have seen of the plant in the province of Colchagua, south lat. 35°, which is its most northern limit. It is found near the snow, and where it freezes, I should say, quite as severely as it does in the vicinity of London. Where the tree grows alone it is very graceful, the lower boughs are even on the ground, and it elevates itself to a great height. The timber is esteemed by the natives for building purposes. I have myself seen it as far south as 42°, and I learn it is found in the vicinity of Cape Horn."

Fine healthy well-established one-year-old plants, from seed, in single pots, 7*s.* 6*d.* each, three for 21*s.*, or 4*l.* per dozen.

HUGH Low and Co., Clapton Nursery, London.

GERMAN FLOWER SEEDS.—Our Selections of the above showy Ornaments of the Flower Garden having for several years given general satisfaction, we hereby announce the arrival of our annual supply, selected by us in Erfurt from those personally known to us as the most select and careful growers. It includes the most distinct varieties of Stocks, Asters, Balsams, Larkspurs, Zinnias, Wallflowers, and Hollyhocks. They will be made up in 5*s.*, 10*s.*, 20*s.*, and 40*s.* packets, and each packet will contain part of the whole collection, if not otherwise ordered by the purchaser.

We have also a carefully selected assortment of all the leading and most approved varieties of Vegetable and Flower Seeds, which we offer at the current prices.

A Catalogue of General Nursery Stock stamped, free by post, may be had on application.

HUGH Low and Co., Clapton Nursery, London.

ORNAMENTAL PLANTING.

C. LODDIGES AND SONS are still supplying collections of ORNAMENTAL TREES at the same extraordinary low prices for cash in consequence of their Arboretum (the largest in Europe) being broken up.

Fine specimens, 5 to 10 feet, correctly named, of the following genera: Acer, Æsculus, Alnus, Betula, Cornus, Corylus, Cotoneaster, Cratægus, Cytisus, Fraxinus, Populus, Prunus, Pyrus, Ribes, Robinia, Salix Sorbus, Spiræa, Tilia, Ulmus, &c., at 4*s.* per dozen. A selection from the above, unnamed, well adapted for Park planting, 25*s.* per 100, or 10*l.* per 1000.

A COMPLETE ARBORETUM, containing upwards of 1200 distinct species, correctly named, can be supplied for 50*l.*

Post-office orders on Hackney.

THE PLANTING SEASON.—WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WM. WOOD AND SON having still on hand a very extensive and superior stock of ROSES, will be happy to supply collections as under (the selection of sorts being left to themselves). The plants are remarkably strong and healthy, and none but first-rate kinds will be sent.

| ROSES. | Per dozen. |
|---|---|
| Extra tall Standards, budded with from 3 to 6 best varieties on a stem ... ... ... ... ... | 42*s.* to 60*s.* |
| Extra superior selected Standards ... ... ... | 18*s.* to 24*s.* |
| Fine Dwarfs and Dwarf Standards ... ... ... | 10*s.* to 16*s.* |
| Superb do. do. (for exhibition) ... | 18*s.* |
| Fine Dwarfs, on own roots, in 50 varieties, per 100 ... | 50*s.* |
| Good do. do. without names, per 100 | 30*s.* |

N.B. A liberal quantity of plants will be given over with each order. Catalogues free on application.

Rose Nippers, of various sizes, for pruning, 2*s.* 6*d.* to 4*s.* each. The Nippers are of an improved shape, being made so as to remove a shoot without bruising the part left; they are highly recommended as a useful addition to the implements of amateurs. Metallic Labels for pot Roses, 2*s.* per 100.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE of Hardy Rhododendrons, Azaleas, Roses, &c., may be obtained gratis on application. It describes the colour of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections. He has many thousands of Rhododendron ponticum in sizes very suitable for planting immediately into Game Preserves, very healthy bushy stuff, price 5*l.*, 7*l.* 10*s.*, and 10*l.* per 1000.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway, and three miles from Blackwater, South-Eastern Railway.

NEW KITCHEN GARDEN SEEDS.—Warranted Excellent quality. Carriage Free! (See below.)

| | £ | s. | d. |
|---|---|---|---|
| No. 1. Complete collection of 20 quarts of the newest and most prolific Peas, with all other Seeds in proportion, for one year's supply ... | 2 | 10 | 0 |
| No. 2. Complete collection, in smaller quantities | 1 | 10 | 0 |
| No. 3. ditto ditto ditto | 1 | 0 | 0 |

*A List of the kinds furnished in the above collections will be found in our* PRICE CURRENT AND GARDEN DIRECTORY, *which can still be had on application.—See* Gardeners' Chronicle, *Jan.* 4, 1851, *back page.*

*** All Seed Orders above 2*l.* delivered Free of Carriage to any Station on the Great Western, Bristol and Exeter or South Devon Railways; or to Cork, Dublin, or Belfast, by steamers.

Apply to WILLIAM E. RENDLE & Co.,
Seed Merchants Plymouth.

N.B.—All the New Vegetable and Flower Seeds advertised from time to time in this Paper can be obtained from us, at the regular current prices.

SEEDS FOR THE FARM, THE KITCHEN-GARDEN, AND THE FLOWER-GARDEN.

JAMES SALTER having tested the Growing Qualities of the Seeds he is now sending out, can with confidence warrant them to be as good, and as low in price, as at any respectable Seed Establishment in the Kingdom. All the most approved varieties of CUCUMBER and MELON, 1*s.* per packet. Flower Seeds forwarded (free) by post. Descriptive Lists, with instructions for sowing, sent on application.

N.B.—Just imported, a Fine Collection of CONTINENTAL FLOWER SEEDS; also, Fine Double ITALIAN TUBEROSES.

SEED ESTABLISHMENT, 2, New Bond-street, Bath.

THE BLACK AUSTRIAN PINE.—"PINUS AUSTRIACA."

LUCOMBE, PINCE, AND Co. have a large and healthy stock of this most desirable Pine, exceeding 300,000, from 9 inches to 3 feet high, which having been frequently transplanted, are well rooted and safe to remove; they can offer them, varying according to age and quality, from 20*s.*, 40*s.*, to 60*s* per 1000. This Pine has been proved to thrive in bleak and exposed places, and in the poorest soils; growing rapidly and producing dense shelter in places where other trees will not grow; it also thrives well close to the sea, resisting the spray and roughest winds.

Exeter Nursery, March 1.

THE inquiry of a correspondent, signing himself "Pod," respecting some standard Portugal Laurels, in the gardens at Trentham, has reminded us of promises made to other inquirers on the same subject; and, in order to convey a clearer idea of the appearance of these trees, we herewith give a sketch of one of them, which is 8 feet high, with a straight stem 3½ feet in height, carrying a head 8 feet in diameter.

In the Italian flower-garden at Trentham Hall there are 68 such trees, than which nothing can be more appropriate or more admired; and the centre walk, which is 40 feet wide and has 17 standards arranged at regular distances on either side of it, is said to be the finest thing of the kind in the king-

dom. The time and attention required to bring these trees to perfection accounts for our correspondent being unable to procure them ready formed from the nurseries. We are aware that some of the nurserymen are endeavouring to obtain them; but, when we state that at least six years are requisite in preparing them for placing in their permanent situations, it will be seen that there is much need for the exercise of patience.

The trees at Trentham, when first bought (about 13 years ago), had their stems formed, but they had very small heads. They were then about 10 years old; but we believe that, by selecting Portugal Laurels already large bushes, and by judicious management, standards may be obtained fit for placing in their tubs in five or six years. We would therefore advise those who wish to possess standard Portugal Laurels to form them for themselves; and to commence a search forthwith among plantations of trees from 8 to 10 feet high, selecting those with the cleanest and straightest stems, upon which the beauty of the standards considerably depends. Portugal Laurels which have been drawn up when young, from having been planted thickly together or among faster-growing trees, are very commonly found with clean stems 3 feet, or even 4 feet, in height; but, when allowed plenty of room, they seldom grow with straight stems, but generally begin to branch out close to the ground. If any very strong branches have to be cut off the stem, they, like nearly all the Prunus family, are liable to gum, and ultimately the trees die; therefore, in selecting plants of considerable size for standards, choose those which have only slender shoots upon the part intended for the stem. These shoots should be cut in at first about half their length; in April, of the following year, they will again require shortening; and, about the same season of the third year, they may be entirely removed. The upper branches should be regulated, so as to cause the head to assume a globular form, by shortening in any strong shoots to within 3½ feet of the centre of the intended head, and keeping the young growths pinched in twice every summer afterwards, until the tree is formed, and in its tub.

In preparing a place for the tree the ground should be first dug out the full size of the stone plinth to a depth of 2 feet, and a communication should be made with the drain at the sides of the walks, in order to carry off superfluous moisture from the roots. A 9-inch brick pillar should then be built in each corner of the hole, to support the plinth, and the hole should be filled with rough draining material to within 6 inches of the general surface, finishing off with some that has been finely broken, the remaining space being filled up with appropriate soil. The plinth should be next set properly, and cramped well at the angles; and the slates forming the sides of the tub should fit together, resting in a rabbet in the plinth, and fasten with screws at the corners. The tubs, which are 3½ feet square, should have no bottoms, as the trees should be permitted to root into the surrounding soil, which they will readily do, and also into the gravel walks. The mouldings shown in our sketch upon the tub are of wood; these are merely ornamental, and may be made so as to move off and on easily, and thus afford greater facilities for painting.

Before the tree is removed from its situation in the plantation, it must be prepared, by being root pruned; and it is important that the roots should be *carefully* cut, so as to leave a square mass of soil and roots, measuring about 2½ feet across from side to side, with the stem exactly in the centre, thus allowing 6 inches on all sides between the ball and the tub for the fibres, and the admission of fresh mould. Some chopped turfy soil, of a rather strong and rich nature, mixed with rough leaf soil, should be used for this purpose; and a top-dressing of the same mixture should be applied about 3 inches deep. These are the first steps to be taken with trees intended to represent Orange trees, and the plants will now be in a fair way to form handsome standards in a short time, particularly if well attended to in watering with liquid manure, whenever they are the least dry; and the young growths carefully stopped when necessary throughout the summer. If the original situation of the tree was very sheltered, and its final position is much exposed, it is necessary to be careful lest the transition be too sudden. In taking up the plants for the tubs, every possible pains should be taken to preserve the newly formed fibres, by working the soil from among them until the ball has been reduced to the size mentioned above. Two stout leather straps made to buckle over strong poles answer best for carrying the trees, and letting them down into the tubs; as they are readily drawn out after the tree is placed in its proper position. In filling in the soil round the ball, let it be well worked in, and copiously watered. Abundance of water should be given during the first and second summers after the trees are placed in the tubs; by which time they will be establishing themselves in the soil outside, to which they have ready access between the pillars which support the plinth.

If the heads are not perfectly formed when the roots first enter the soil and gravel (for they will extend as far into the walk as they do into the soil under the turf), they will not be long in becoming so. Some of the plants at Trentham looked nearly dead the second year after planting, but by the end of the third year, when they had got their roots under the general surface, they were completely restored. After the trees are perfectly formed, cut them once a year in April; but they should be thinned as well as pruned, in order to allow air to penetrate the interior of the head, and to prevent the leaves from appearing thick, as in a hedge.

Should any of the trees exhibit a disposition to flower too abundantly, it is a sign of weakness; and every flower should be pinched off as early as possible in the spring. Give some liquid manure to such plants when requisite, and they will soon become vigorous again.

No Orange trees that we have ever seen are half so handsome as these standard Portugal Laurels are when in flower; and their beautiful dark green and healthy foliage adds a richness to the scene which no other tree but the Sweet Bay or Hodge's Broad-leaved Holly could possibly effect.

To form standards from young plants, it would be necessary to commence with two or three-year-old seedlings; planting them out in rich soil in a sheltered situation, and frequently pinching in all the side branches until the leading shoot has attained the desired height, when it should be stopped and the head encouraged to extend regularly. The roots should be cut round once in two years, in order to keep them near home, and to encourage numerous fibres, instead of long naked roots. Some fresh rich soil should be applied every time the roots are examined, and plenty of manure water given frequently in dry weather. In this manner most perfect specimens could be obtained; and we have no doubt that many other kinds of evergreens would readily yield to similar treatment.

---

Gentlemen who propose to contribute to the forthcoming Number of the Journal of the Horticultural Society, are requested to favour the Vice-Secretary, 21, Regent-street, with their communications as soon as possible.

## IRISH PEAT CHARCOAL.

I have tried the following plants in a mixture of this material and earth, with the following results:—

Geraniums.—These luxuriate in a mixture of 3 oz. of pure charcoal to 1 lb. of mould. In this material they make good saleable plants in half the usual time. Cuttings strike freely, either in the pure charcoal, or in the mixture.

Cucumbers.—For these I mixed the charred peat with mould during winter, and when the plants were put into it, they grew famously, and produced a heavy crop. The peat charcoal not only yields nutriment, but it affords good drainage. Cucumber tops strike root freely in pure charred peat.

Melons.—These succeeded in a mixture of charred peat and soil equally well with the Cucumbers; and if a large proportion of the soil consists of peat, I am of opinion that the flavour of the fruit will be improved, more especially in cloudy sunless seasons.

Strawberries grow admirably in charred peat mixed with soil, and in the case of pot plants they like a good handful of the pure peat placed in the bottoms of the pots. This latter has a tendency to prevent the ingress of worms, who do not appear to like its sharp edges.

Vines.—I have not yet tried the effect of charred peat on Vines'; but, judging from analogous cases, I am certain that it will prove of much advantage to them, not only as a fertiliser, but also as a means of keeping the borders porous, and thereby bringing better into action the other materials of which they may be composed. Under such an arrangement, finer flavoured fruit may be expected.

Potatoes.—I have found those manured with charred peat drier and more mealy than others to which farmyard manure was applied. In the former the foliage and stalks are more compact and firm, and when taken up the tubers were found to be clean skinned. In my case no wireworm came near them. Where Potatoes are pitted in long ridges, in the open ground, a layer of peat between them and the soil helps to keep them dry, and if this heap could be covered with it below the straw it would also be an advantage.

In Flower Gardens, peat charcoal will be found invaluable, inducing, as it does, quick growth; but not over luxuriant, and consequently plenty of blossoms. Under its influence the colours of the latter are also well "brought out."

For Sweetening Cesspools, and other unavoidable nuisances, peat charcoal finely pounded will be found universally useful. I say finely pounded, because the more intimately it is mixed with the material to be disinfected the greater will be its power. 1 lb. of charred peat takes 1½ lb. of water to saturate it, and hence, in addition to its sweetening qualities, it possesses great value in giving night-soil mixed with urine such a consistency as to render it capable of being transferred from our large cities, where it is not wanted, to our rural districts, where it is wanted, and where it will assist our at present distressed agriculturists to farm more highly. In this way "a plague may be turned into a profit."

The experiments mentioned above were all tried last year. This season I have found that if, instead of horse-dung being turned and sweetened for a month before it is used for forcing, it is allowed about a week's laying, and then put into a four-light pit and covered over with an inch of peat charcoal, all will be well. Under this system, by the time my Cucumber plants came up, all smell was removed. Again, gardeners are much annoyed in January and February by plants damping off. I dusted my Cucumber plants in the pans every morning with peat, and I did not lose six out of 600. I have, unfortunately, had to repeat the experiment, on account of my lad having overheated the flue and burned the whole of the interior of my pit. I have again about 600 plants dusted with peat, and they look as well as the first did. In filling the pots I made holes in the mould with the finger, and dropped the Cucumber plants in, in the manner in which Leeks are planted out of doors. I then filled up the hole with peat. Those treated in this way throve better than the others, and produced a more healthy dark green leaf. In short I consider charred peat in a Melon ground to be as necessary as a telegraph to a railroad. The one is incomplete without the other. The sort of charred peat that I use is the granulated kind. *James Cuthill, Camberwell.*

---

## VILLA AND SUBURBAN GARDENING.

Suburban gardens are, of necessity, limited in extent, and surrounded by houses and high walls, which prevent a free circulation of air; vegetables produced in them are frequently but indifferent, as regards a crop; attenuated, and, of course, liable to numerous casualties. Winter crops in particular are often swept off by a moderate frost; and to no one kind of vegetable does this remark apply more truly than to Broccolies. How different, indeed, are even the same varieties, when cultivated in open fields, where a free circulation of air, and a full exposure to sunlight, perfectly elaborate their juices, rendering the plants sturdy, compact, and dwarf. What are known as low-growing kinds in the open fields, become standards in enclosed gardens; but, then, from the nature of the circumstances, this is unalterable, and must be put up with. Were a different system of planting adopted, however, much of the evil could be obviated. I should think that, if such a method of culture was introduced as that which market-gardeners in the northern districts pursue in regard to their Celery, it would answer. This consists in planting in beds having rows stretching across them, and the soil is thrown from the paths between the rows. If this operation was performed in the autumn, a double benefit would be the result. The plants would be firmly secured in their position, and the trenches on either side of the beds would keep them much drier; for such trenches would act as a ready drain to receive the heavy autumn and winter rains. Before the earthing took place, it would be advisable to remove all the under leaves which indicate any tendency to decay. This should be done cautiously; for if carried to an extreme, the wounds inflicted upon the stems would be liable to induce rot.

Where an unoccupied glass structure exists, such as a Grapery, a good winter supply of this vegetable may easily be obtained. A dozen or two of the plants may be taken up at a time, and laid in a little soil by the heels. They will soon thrust up their heads, and by pursuing this course, a constant supply may, with little trouble or expense, be maintained. An amateur of my acquaintance winters his Broccoli under his Pelargonium-stage, together with Rhubarb and Seakale, an asphalte covering being suspended a little way under the stage, to carry off the water that escapes from the plants. The asphalte is attached to a few laths, and a slight inclination is given to it. By this simple contrivance the vegetables cultivated beneath the stage are kept perfectly clean. In a mild winter, like the present, such schemes may not be necessary; but, in severe seasons, Broccoli is not so easily obtained. In regard to winter vegetables, we have much yet to learn from our Continental neighbours, who adopt various ingenious plans to secure them, of which we at present know but little. *Pharo.*

---

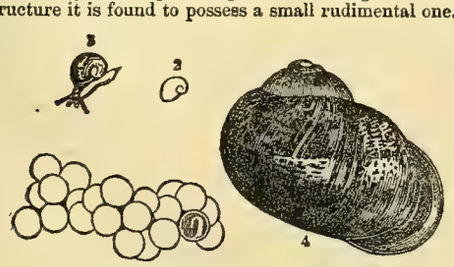
## WHAT IS AN INSECT?

If we were to publish only a very few of the many queries which we receive, and which a slight knowledge of the first rudiments of zoology would solve, we should at once establish the proof of the necessity which exists for the occasional publication, in scientific journals like our own, of articles treating upon the first principles of natural science. To those who are acquainted with the routine of education on the Continent, and especially in Germany, where natural history, zoology, and botany are taught in all the burgher, or, as we should term them, grammar schools, it does seem something like a reproach to ourselves that there are many, otherwise well educated, persons who firmly believe that both a whale and a lobster are fishes, that a leech is a kind of insect, that the small house-fly is only the young of the blue-bottle-fly, that the dragon-fly

bears a most poisonous sting, that the departure of crickets from a house is as sure a sign of some foreboding evil as the ticking of the death-watch, and that it is the natural habit of the earwig to creep into the ears of sleeping persons, causing madness by penetrating the brain. We propose in the present, and a few subsequent articles, to offer to our readers a simple digest of the leading principles of Entomology as a science, which, from the every-day occurrence of its objects, and the great effects they produce upon the labours of the gardener, merit at least some portion of attention.

One of the commonest errors into which the ordinary inquirer falls, arises from the general notion that every small animal which is neither a bird, beast, nor fish, must be an insect. Such a notion is often imbibed from the manuals of natural history placed in the hands of children; from the greater interest attaching to the higher animals, the greater portion of such works are occupied with mammals, birds, and fishes, and all remaining kinds of animals are crammed into the smallest possible compass. Here, under the head of Insects, or Insects, &c., we find the lobster and the shrimp, the scorpion and the spider, the butterfly and the beetle, the leech and the worm, the snail and the oyster, the starfish and the polype, all classed together, and thus, without any definite idea as to what are the real characters of the classes to which these various animals belong, a general idea impresses itself on the mind that the name of Insect may be applied to them all.

But *what is an insect?* This is a question which can only be satisfactorily answered after a few preliminary remarks on the chief divisions into which the *invertebrated* animals, or animals without back-bones, are divisible.

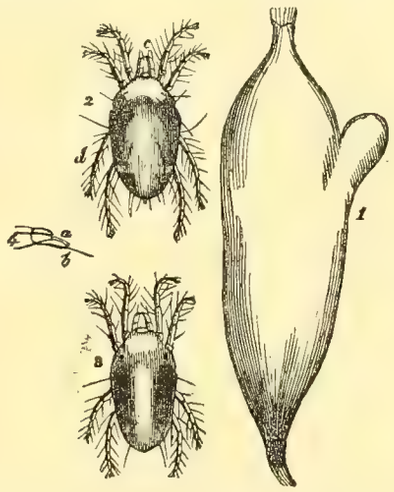


A first great division, or sub-kingdom of those animals which do not possess an internal vertebral column (or back-bone) is termed *Radiated,* and consists of great numbers of creatures for the most part resident in the ocean, or in fluids, which have the limbs or arms radiating from a centre. Many of these exhibit so fantastical a resemblance to flowers, that a poet thus writes of them:—

> "Seas have,
> As well as earth—Vines, Roses, Nettles, Melons,
> Mushrooms, Pinks, Gillyflowers, and many millions
> Of other plants, more rare, more strange than these—
> As very fishes living in the seas."

Here belong the sea-anemone, sea-urchin, starfishes of various kinds, Medusæ, coral plants, and the many strange sorts of zoophytes and polype—creatures, of whose nature, whether as animals or plants, doubts have been entertained by many eminent writers. Amongst the radiated animals have also been arranged by the first zoologists, the strange tribes of intestinal parasites, or Entozoa, such as the ascarides, tape-worms, &c., in all which the radiated character of the sub-kingdom is more or less obsolete; and a greater resemblance to the general notion of the type of insect-form is adopted, but which, from their internal structure, nervous system, and mode of development, are more properly referable to the sub-kingdom Radiated.

A second great division or sub-kingdom is termed *Articulated;* it comprises all those animals which have the body of a symmetrical form, composed of a series of rings or segments, and having a peculiar arrangement of the nervous system, consisting of a double thread running along the whole length of the body, united at certain distances by knots or ganglions, from each of which knots extend nerves, so that each may be likened to a separate brain; and hence the dissemination of nervous intelligence over the entire body, and the facility with which many of these animals pursue their functions after part of their bodies have been injured, or even cut off. We need hardly state that insects, spiders, crabs, leeches, and earthworms, are Articulated animals.



The third and last great division or sub-kingdom of Invertebrated Animals is termed the *Molluscs;* it consists of those soft-bodied animals which neither possess a radiated nor articulated body, but which are covered with a soft integument, are destitute of jointed legs, and have the nervous system unsymmetrical in its arrangement. The soft consistence of the body of most of these animals renders defence necessary, and this is effected by the formation of hard calcareous coverings of infinitely various forms, which are called shells, the materials for which are secreted by the animals themselves. The oyster and garden snail are the most familiar instances of this sub-kingdom, and closely allied to the latter is the slug, which is not furnished with an outer shelly covering, although on examining its internal structure it is found to possess a small rudimental one.

Eggs, young, and shell of garden snail.

On reviewing the characters of these three sub-kingdoms, we at once obtain a first answer to the query, What is an insect? namely, that an insect is an articulated animal with a symmetrically arranged knotted nervous system; and at the same time we have learned that the star-fish and the polype, the tape-worm and the ascarid, the snail and the oyster, are not articulated animals, and therefore cannot be insects.

But although the articulated structure of the body is a character exhibited by all insects at some period of their existence (generally, indeed, throughout all the stages of their lives), all articulated animals are not necessarily insects. Here, however, we must bear in mind the excellent observation of Messrs. Kirby and Spence, "There is no general rule without exceptions, and no character is so universal as to be distinctly exhibited by every member of a class or other natural group. Thus in the majority of the mites (Acarus, Linn.) the body is marked by no segments, and the only articulation, or incision, is in the legs, palpi, &c.; but as the exception does not make void the rule, so neither does the extenuation or absence of some primary character at its points of junction with others in some individuals annihilate the class or group." (Introd. to Entomology, vol. iii. p. 4, note *d.*)

The red-spider, or mite (Acarus telarius), male and female, with the mouth and web.

Strictly speaking, indeed, the term insect (that is, an animal cut into sections), is synonymous with Articulated or Annulated; but the Linnæan character of the class Insecta, "small many-footed animals, breathing by lateral spiracles, defended by a bony skin, and provided with moveable sensitive antennæ," excludes not only crabs and other shell-fish breathing by gills (which Linnæus introduced among insects), but also spiders, which have no antennæ, and all the Annelids (or earthworms, leeches, seaworms, &c.), which are equally articulated and furnished with a double knotted nervous system.

The distribution of the articulated animals will furnish us with a more extended reply to the query, "What is an Insect?" and will be the subject of our next article. *J. O. W.*

## MARKET GARDENING ROUND LONDON.

No. IX. Mushrooms.—These are much sought after in Covent Garden market, where their annual sale amounts to several thousand pottles, each pottle weighing a pound. Mushroom beds are made after the following manner:— As the fresh manure is brought home from the London stables, the short material is shaken out of it, and the long strawy part is kept for the purposes of covering as well as for forming the interior of ridges, for all Mushroom beds out of doors are made into ridges. The manure is not allowed to heat before it is put into the beds, if that can be prevented; for previously heated material does not produce such fine Mushrooms. The fresher the horse-dung is the longer will the crop last; and every gardener who makes up beds with unheated droppings, knows how superior they are to fermented manure. If this is properly attended to, it does not signify what kind of mould is used for surfacing the bed with. Market gardeners obtain enormous crops from ridges covered with common light well-enriched mould. When the interior temperature of the ridge gets down to 80°, it is spawned with pieces about 2 inches square, placed about a foot apart: the bed is then moulded over 2 inches thick, pressed with the feet, and afterwards beaten with the spade. It is then watered and beaten again with the spade, and smoothed down. The more the mould is pressed the finer the crop is, and the more solid the texture of the Mushroom. This and green or unheated manure constitute the two grand secrets in Mushroom growing. Mushroom beds made up in this way want but little watering, and when they are watered, it ought to be with liquid manure. The ridges are covered with straw and mats; such ridges as these are continually being made, and when well formed, they last from two to three months in good bearing. I believe I am correct in stating that there are about 10 acres of ground round London continually under Mushrooms, which are all wanted for the various metropolitan markets.

Mulching.—Summer covering, or mulching, with stable litter, is extensively practised by many of the first-rate market-gardeners, not only in the case of Strawberries, but also in that of plantations of Gooseberry and Currant trees, as well as in some orchards. This mulching not only keeps all fruit clean, but it has many other advantages; for instance, it maintains the surface of the earth in a moist state, thereby preserving all top fibres, and, in addition to keeping down weeds, when dug in, it enriches the ground. Unfortunately, if this covering or mulching was practised in private kitchen-gardens, it would be considered slovenly. Nevertheless, it is my opinion that, during summer, all crops ought to have a good mulching. This would greatly assist hungry gardens in which a necessary quantity of manure is not allowed. *James Cuthill, Camberwell.*

## GRAFTING.

No. IX. English Cleft Grafting: fig. 11. (*Greffe en fente dite à l'Anglaise.*) This mode is not generally employed, except for hard-wooded plants, with little sap, and small medullary sheath.

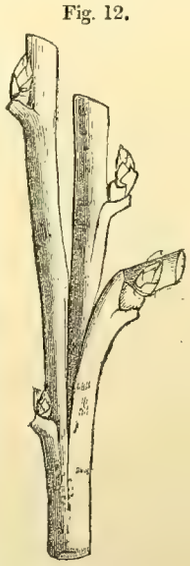


Fig. 11.

*Operation.*—Take a straight well-grown shoot, and cut it to the length of two or three eyes; cut the base with a long slope opposite the lower eye; make a longitudinal slit in the face of the slope, so as to form a tongue. Let a counterpart be made in a stock of the same size as the scion; introduce the tongues of each into the slits prepared for them, and thus unite the whole. A piece of paper tied round this graft will be sufficient for securing it.*

Cleft-grafting in the side of young Stems, Branches, and Shoots, of the same size as the Scion: Fig. 12. *Operation.*—Whatever may be the nature of the scion, its base should be cut in as lengthened a wedge-shape as circumstances will permit. The place intended for it in some analogous stock should be previously fixed upon, and always in the fork of a small ramification of the young stem, or in the axil of one of its leaves, or of an eye. This young stem should be cut back a little above the place intended for the insertion of the scion, always taking care that the small stump has one or two eyes left, or some small branchlets, half leaves, &c.

Fig. 12.

We make at the place selected for the operation in the stock a somewhat slanting cut, downwards, till it reach the medullary sheath, dividing it into two nearly equal parts, as may be seen by the figure. This cleft should be made by a single effort, and as quickly as possible, in order that the blade of the knife may not have time to deposit oxide of iron, which is always injurious to vegetation. The place being thus duly prepared for the reception of the scion, it is inserted; and it must be maintained in its position, and otherwise attended to according to the principles explained under the head of "General Observations."

This newly-invented mode may be substituted for all the others comprised in this group, and it possesses many advantages which cannot be obtained from them; for it is applicable to plants of which the branches and other younger productions are of the smallest possible dimensions. I have grafted by this proceeding some Heaths and Junipers, of which the parts worked were scarcely one-twenty-fifth of an inch in diameter.

The different species of Oaks, Beeches, Walnuts, and Chestnuts, &c., either in the solid or herbaceous state, generally take well by this mode of grafting. We can, moreover, easily comprehend the advantages which result from the small stump being reserved for the purpose of drawing the sap, which, forced to collect in it, descends along the bark, and powerfully contributes to the union of the adjoining parts. During the time that the graft is taking, the productions which are developed on the small stump should be pinched, or otherwise kept in check, in order to prevent them from producing a different effect from that for which they were intended; after the graft has fairly taken, the small stump should be gradually more and more reduced, till it entirely disappears. *Translated from the French of D'Albret.*

## TRADE MEMORANDA.

Can any one inform us who J. Bruce, of 17, Burlington-street, Liverpool, is? Perhaps some agricultural implement dealer may be able to answer the question.

## Home Correspondence.

*The large Elms in the "Crystal Palace."*—I have read, with attention, your observations upon the pro-

* In M. D'Albret's figure the tongues are represented much too long. Fig. 11, as here given, will convey a correct idea of the form which the respective parts should possess.

bable fate of these trees, in which the world seems to take so much interest. I believe with you that they will not suffer, if the conditions proposed by Mr. Paxton are fully carried out, more particularly that part of them which secures the access of air to the roots. Had the floor been of concrete, asphalte, or paving, my opinion is that the result would have been highly injurious, and probably fatal. In proof of the injury done by covering the earth in which the roots of trees are growing with such materials (without making some extraordinary provision for aeration), I may mention the following instance of mischievous results:—In the year 1849, I had occasion to concrete the surface of a border under a north wall, for the purpose of setting pots upon during the summer months, thus rendering it impervious to worms. Upon this wall, there were two fine healthy Morello Cherry trees growing, in a well-drained, porous border of fine sandy loam, and of course under all the conditions favourable to their healthy progress, excepting the one I have just mentioned. The following year, they began to decline in vigour, and this year they are wholly dead. I think you do wisely in pointing out to those who are in authority, that these trees, although safe themselves, are fraught with danger to the public. My own experience confirms your view of the treacherous nature of the branches of old Elms. Living in the midst of fine trees of the English Elm, I am a constant eye-witness to the sudden fall of a mighty limb, with a report like the discharge of artillery, and this in the most still and sultry weather, when scarcely a zephyr is breathing; while in the midst of the storms and desolation of winter the trees are rarely injured, unless the branches are loaded with snow. My conviction of the insecurity of large branches of Elm in the summer months is such, that I would not willingly stand under one, or cause a seat to be placed under it. Undoubtedly the increased leverage caused by the weight of foliage is one cause; but may it not be owing to the expansion by heat of the fluid matter which the tree contains, in some degree? May not the expansion of the vessels to a greater degree than usual weaken the tissue, and render it less capable of sustaining the superimposed weight? What say you? The question is of grave importance as far as the Crystal Palace is concerned. Should the dangerous trees be retained, however agreeable and inviting their shade may be, I would repeat the maxim of the old poet, "Nimium ne crede colori." I fully believe that casualties of this kind are in the proportion of three to one more in calm summer days than in stormy wintry ones. *Henry Bailey, Nuneham, Oxford.*

*To Keep Birds from Picking Fruit.*—As the season is coming on for the depredations of birds, I beg to report my experience of last year, when I saved my Currants and Gooseberries, by winding coloured worsted round and across my bushes; and my Cherries, by hanging up several pieces of tin with strong thread in the different trees, two pieces being hung near enough together to clash with the wind, which sound, with the bright reflection of the tin in the sun, certainly frightened them away, and I had my due share of fruit, which, the preceding year, I was obliged to relinquish to them. *H. M.*

*Begonias* (see p. 118).—I would advise your correspondent, "A. M.," to give his Begonia fuchsioides a moist atmosphere, and from 65° to 70° of heat by day, lowering the temperature at night. B. incarnata will do well in a conservatory, and it is by far the most showy of the genus. I have some plants now in bloom here, which have been in flower ever since the beginning of October, and they are likely to continue in bloom two months longer. I would prefer incarnata to fuchsioides for a cold conservatory. *W. Culverwell, Thorp Perrow.*

*Torenia asiatica.*—This Torenia may be grown in the following manner, so as to form a highly ornamental object. Take a cutting from a specimen that is free from insects in August. When it has struck root, pot it in a 3 inch pot in peat, loam, and silver sand; then place it in the hothouse under a hand-glass for three or four days, after which it should be hardened by degrees, by removing it to a shady part of the same house. Afterwards place it near the glass, and frequently stop it, in order to encourage it to make laterals. About the 1st of December it should be shifted into a pot a size larger than that which it occupied, using turfy peat, loam, and silver sand. In the beginning of April it should be potted for the last time into a 7-inch pot, in the same compost as before, to which a little manure has been added. After this, all stopping should be discontinued, and it should be placed where it will not become drawn up, by being too near other plants or too far from the light. In May it should be staked in the following manner: one upright stake 4 feet in length should occupy the centre, and four others 3 inches shorter should be placed at equal distances round it. Then four more 2½ feet long should stand a little nearer the rim of the pot, and eight more 3 inches shorter should be placed round these, so as to form an outer circle. The whole of the stakes should incline outwards, except the centre one. With regard to the disposition of the shoots, three of the strongest should be tied round the middle stake, and two to each of the other supports, except the two outer rows, to which the outside branches should be suspended in regular gradation, one below the other, observing that the longest shoots be trained towards the centre. If staked in this way, and a very liberal supply of water be given, so as to allow it to flag from May until August, occasionally watering it with liquid manure, and slightly shading it when the sun is powerful, it will have covered the stakes by the end of June; and, by the end of August, the branches will droop from all sides of the plant, covered with their beautiful blossoms, while the pot will scarcely be seen. *W. K., Knowsley-hall Gardens, Lancashire.*

*Cacti.*—"I manage these plants myself," remarked a gentleman to me in allusion to a nice little collection of Cacti, in which were representatives of most genera of that interesting tribe of plants. "They are my favourites, not perhaps from actual taste, but from circumstances. You see I am the greater part of my time buried beneath that murky atmosphere yonder," pointing towards London, for the garden in which we were was attached to a pretty villa some eight or ten miles distant from the metropolis, "and I could not afford the necessary attention to plants of delicate habits and constitutions. I find no difficulty in making them bloom profusely, and almost at any season of the year. The great secret—if secret it may be termed—lies in the proper application of water. A dry season and a moist one they must have—alternate periods of rest and growth are the great essentials to satisfactory culture. Here you see are Mammillarias, Epiphyllums, Cereuses, and Opuntias, all in excellent condition. At all seasons I find something in them to admire. Now it is the rich corollas of the Epiphyllums, then the serpent-like trailing of the Cereuses, and anon the grotesque forms of the Mammillarias or the Melo-cacti. In fact I love my plants. I have tended them so long with my own hands that I entertain a real affection for them, and—don't believe it a weakness—I always imagine they look brighter when I pay them my accustomed morning visit. I said the great secret was water. I believe it. Before I took their management into my own hands, death was for ever making merry amongst my pets. Rot, rot, rot. About every alternate week my man would meet me with a rueful visage and something like the following complaint:—'Another of them Cactuses is dead, Sir. He had'nt got no roots. The nurseryman you bought 'em on, Sir, cheated you; and as he had'nt had no roots, why, in course, the water rotted 'en.' In nine cases out of ten the water had 'rotted 'en,' beyond all cure. So, tired with constantly buying, and receiving no pleasure for my money, I determined to try what common sense would effect in their management. I had been reading a work on physical geography, and a page or two of the work detailed the natural conditions of the succulent plants found on the plains of tropical America and Africa, the home of so many of the Cactus tribe. I learned that the two seasons, the wet and the dry, were excessive. At one time the soil is scorched, and at the other flooded. Here Cacti flourish. Provided with a skin that will, to a great degree, resist evaporation, they struggle almost unhurt through the fiery ordeal, and when the periodical rains saturate the soil and moisten the atmosphere—for from the latter they imbibe a large portion of nourishment—thousands of flowers stud their grotesque forms. I followed as near as possible these conditions, and my success was perfect. When I water I flood the whole plant, not only the soil in which it grows, but its whole surface. This treatment, after a period of rest, induces immediate growth and blossom. After this I gradually permit the plant to sink again into repose, to be again brought into flower. A long period of rest is not necessary. We can outstrip Nature, divide one season into two, mimic the Sahara twice a year in the hothouse, and enjoy its beauties without any disagreeable addenda." *Alpha.*

*Rain.*—The following is an account of that which fell at Thurston, near Dunbar, N. B., during the last five years. Thurston is 280 feet above the sea, from which it is distant two miles. Latitude, 55.57 N.; Longitude, 2.29 W.

*Destruction of the Wireworm.*—I beg to furnish you with a copy of the following plan for destroying wireworm. I know nothing of its merits myself; but I intend trying it for Carnations. Some years ago, Mr. Charnock was complaining, in the presence of Sir Wm. Cooke, of the injury his field crops had sustained from wireworm, and lamenting that there was no way of destroying them. Sir Wm. then informed him that he had heard of and adopted a plan which had proved perfectly effective, and which Mr. C. subsequently followed with the same success. In lieu of the ordinary top-dressing of Rape dust, apply to the land, and mix well with the soil, 5 cwt. per acre of Rape cake, crushed into lumps about the size of half inch ground bones, and the result will be that the wireworms will congregate on these lumps of cake, devouring them with such avidity as to become glutted, and perish either from repletion or from the peculiar properties of the Rape. Rape dust will not answer the purpose, because it presents no surface upon which the worms can fix themselves, and no substance into which they can eat their way. Perceiving that a satisfactory result was being attained in the first field to which the cake was applied, Mr. Charnock took up and examined many lumps, and found them full of the defunct and expiring enemy. The practice was of course followed wherever the worm prevailed, until in a year or two the land was perfectly freed, and that without any recurrence of the evil. Mr. Charnock also, on several occasions since, has had recourse to the same means for preserving his Carnations, which are very liable to be attacked, and he has invariably witnessed the same satisfactory results. The plan is so simple, an apparently so efficacious, that I need not dilate farther upon it than to remind those who may be disposed to try it, that whilst they may hope to destroy the worm, they will certainly add a rich fertiliser to their ground at a reasonable cost. It should perhaps be mentioned that the land to which Mr. C. applied the remedy, is a dry soil on the magnesian limestone, and I believe Sir W. Cooke's was the same, but I see no reason for supposing that it would not be equally efficacious on other soils. *E. F. K.*

*Timber Trees.*—A short time ago your columns contained a few suggestions from a correspondent, who signed himself "A Young Gardener." After lamenting (not without good reason) the little attention that is paid to rearing timber for naval purposes, and expressing sundry dismal apprehensions on the subject; in the height of his enthusiasm for "British Oak," he advises that farmers shall in future be compelled to rear some clumps of trees in their fields. Now, with all deference, I would suggest that so long as the country possesses capital, if we do not get home-grown timber we shall always be plentifully supplied from other sources. I almost fancy I hear the "British farmer" exclaiming, in his present depressed state, "save us from our friends." I cannot help thinking the suggestion an unhappy one, more especially at this crisis, when the utmost must be made of every inch of ground. On arable land, groups of trees are most objectionable; they both do mischief to the cultivator, and are ruinously treated, by having their roots cut off, and by careless lopping. A few trees in parks or Grass grounds are desirable, but a war of extermination has set in against them upon well cultivated arable fields. Let our woods be better managed; but let our fields be unincumbered by the large fences and trees which are so frequently seen. *Henry Bailey, Nuneham.*

*A Plan for forcing Asparagus, Seakale, Rhubarb, Chicory, &c.*—Nothing is more easy than to have the above all the winter, and that too by the most simple means. All that is wanted is a good supply of roots. Asparagus three years old; Seakale grown from pieces of roots planted in the spring, make fine plants in one summer; Rhubarb also makes fine plants, by dividing a large root into as many pieces as there are eyes to the crown, planting it out in January. Chicory sown in May or the 1st of June, makes fine roots for forcing, and a brick pit divided into two lights or more, according to the size of the family, will be necessary for the purpose. The pit should be heated with hot water in a three-inch pipe, which should run along within a foot of the glass, descending at the further end, and returning along the bottom in the centre of the pit to the boiler. The length of the pit should not be less than 16 lights, which will afford the means of producing a regular rotation of the above vegetables. Its depth need not be more than 4 feet in the back, and 2 feet 6 inches in the front; and for convenience in getting at the centre it should be 6 feet broad. When the above vegetables are out of season the pit would be suitable for the production of Cucumbers, Melons, and many other things. It may, perhaps, be needless to mention that Seakale must be kept quite dark; as must also Chicory; and Rhubarb is more tender if too much light is not allowed to reach it. It would be well if no other heating power were employed than hot-water. Dung is good in the shape of manure, and cannot be dispensed with; but men's time would be more usefully employed in keeping other parts of a garden in good order than in turning over and over dung with a view to keep up heat, and at the same time destroying its best qualities. Such a pit as the above need never be idle, and might with much propriety be called the "industrious pit." *James Cuthill, Camberwell.*

*Plant buying.*—If I purchase a horse, I either rely on my own eyesight and judgment, or I require a warranty; and if I do not require a warranty, if the horse turn out lame or sick, it is all "on my own account and risk" as the merchants say, unless indeed a gross case of fraud or concealment can be proved against the horse-jockey, and then perhaps (at a cost far greater generally than the first loss) I may obtain redress. If I buy a plant or tree of a nurseryman, I am bound to judge from the general appearance of the plant, of its general health, and no guarantee is required; if it die, it is the fortune of war: however, to prevent disappointment, the wisest course in dealing with all tradesmen, is to adopt the political economists, maxim, and pay "for verification of quality," by going to the tradesman of the best character, paying, as is usual, some 25 per cent. extra. I have, however, understood that many nurserymen, on learning that a plant sent out has died, where there is no reason to suppose it has perished from ill-treatment, replace it—but I believe there is no such general rule in the trade; indeed this would be obviously inconvenient, and would lead to dispute if it were. I have been led to the consideration of this point by having my advice sought by one under the following circumstances. My friend purchased of a gentleman collector through his gardener by a list, without inspection, a set of plants, and when de-

livered to his own gardener they appeared to be in fair condition; but it turned out that the greater part of these plants, though carefully treated, died; none however of the others in the original collection partook of this mortality, and the fair inference was that the plants sold had either been unduly exposed, or were not in a good state when sold; in fact, like some of the chinamen's plants they had no roots, &c. I advised, that unless actual fraud or misrepresentation could be proved, my friend had no remedy, beyond ineffectual remonstrances. I added a recommendation that for the future my friend should make his purchases perhaps at a greater cost, but where he had the character of the tradesman to rely on. The point however, being new, have any of your correspondents any information on the subject to give? *D.*

*Rhubarb.*—In comparing the relative qualities of forced and natural grown Rhubarb, Mr. Cuthill observes that the former is so delicate and tender, that it is not necessary (as with the latter) to remove the outside or stringy portion of the stalk. Now, as observed on a former occasion, the best and proper way to prepare this vegetable for a tart, is simply to wipe and wash it, and then chop it into pieces, of at least an inch in length. By no means remove the outer portion of the stalk, for this deprives it of the beautiful scarlet colour, which growers take so much pains to obtain, by covering each plant with litter. At this moment, within a few minutes' walk, are acres of Rhubarb so covered, not with a view to get it earlier, but solely to obtain the rich colouring which renders it saleable, and which the skinning process would remove. Your correspondent, Mr. M'Elroy, of Stamford Hill, very justly praises Mitchell's Prince Albert; it is certainly the best early Rhubarb, it was pulled from the open and unprotected ground on this spot, and sent to market on the 17th instant. Its principal defect seems to be want of continuous vigour, and in this respect it is immeasurably inferior to Myatt's Linnæus and Victoria. The Albert comes remarkably well the first season after planting, and continues tolerably good for three or four years; it then becomes puny, throwing up a quantity of small stalks. It should, I believe, be renewed every four or five years. Not so the Victoria or Linnæus—give them plenty of dressings, and they will stand for 12 years, without showing any signs of exhaustion. I have known them produce astonishing crops after having been planted 18 years. *G. T. W.*

## Societies.

Linnean, *Feb.* 18.—W. Yarrell, Esq., in the chair. Mr. Thomas Moore, of Chelsea, was elected a fellow. A letter was read from Benjamin Clarke, Esq., to the President of the Society, on the subject of the position of the carpels in some genera of plants, that had not been determined in his recent paper read before the Society. A paper was read, communicated by the President, giving an account of the *Aquilaria Agallachum*, of Roxburgh, the tree which produces the wood known by the name of Aloe's wood, Eagle wood, &c., by Messrs. Dicks and Colebroke. The tree which produces this precious wood grows in various parts of Hindostan, and also in Cochin China. In order to produce the wood the trees are cut down, and only those portions are cut out which contain the scent, for which the wood is so highly prized. The wood is powdered, and used for burning as incense in the temples of China, as also for religious purposes in this country. When distilled, it yields an essential oil, which goes under the name of Uttur or Uggur. The portions of wood which contain the oil are heavier than water, and are known by their sinking in it. The paper was illustrated by an original drawing of the plant, by Dr. Roxburgh.

Botanical, of London, *Feb.* 7.—A. Henfrey, Esq., in the chair. The following donations were announced: British plants, from Mr. Fenton, J. A. Hort, Mr. B. D. Wardall, and Mr. J. Lynam: also, the "Royal Agricultural Society's Journal," and the "Pharmaceutical Society's Journal," from their respective societies; and the "Magazine of Botany," from the Editors.—Read the continuation of Mr. Daniel Stocks's Paper "On the Botany of Bungay, Suffolk."

## Notices of Books.

*Carl von Linné's Anteckningar öfver Nemesis Divina. Inljudning's-Skrift til morgondagens Philosophiska Promotion från Upsala Universitets Stiftelse den Sjuttiondesjunde af tillförordnad Promotor Elias Fries.* Upsala Kongl. Ac. 1848. Fol. pp. 20.

Though this academical paper has no connection either with gardening or botany, we think that it may not be uninteresting to notice it, as an account of a recently discovered treatise of the celebrated Swedish botanist, to whom science is so much indebted, though for many years the extravagant deference paid by his admirers to everything that came from his pen, had rather a tendency to obscure that real and peculiar merit which has caused him to be considered legitimately as the father of botany.

The pamphlet before us then, the possession of which we owe to the kindness of the author, is simply a lecture delivered at the University of Upsal to the young men graduating there on the day before taking their degrees, a kind of commencement sermon, in fact—without a text, the subject taken up by the lecturer, the well-known Elias Fries, being a work of Linné's, called "Nemesis Divina," which was never published during his lifetime, nor indeed intended for publication, being merely, as it appears, a collection of instances of the retributive justice of Providence, designed for the instruction of his son. Such a collection Linnæus was known to have made, but the papers were entirely lost sight of, and only discovered a few years since by Dr. Acrell, a son of Professor Herell, who had the disposal of the manuscripts left by the younger Linnæus. It has now been deposited in the public library at Upsal, by Dr. Calmer.

The work, if a judgment may be formed from the extracts here given, does not seem to be of any great value, except so far as it may throw light on the character and mind of Linnæus. The lecturer commences with some remarks on retributive justice as displayed in the Providence of God, and alludes to the peculiarity of Linnæus' ideas thereon, the peculiarity consisting apparently in his having imagined a kind of regular system, upon which the workings of Providence develope themselves. That such a system exists who can doubt, but, embracing as it does relations infinitely too extended and complicated for man's research, it must lie far beyond the sphere of his understanding. After this opening, an account is given of the work itself and its discovery, together with some extracts, first of sundry moral maxims and then of some practical examples of providential retribution, chiefly instances occurring under the writer's own eye, and lastly, of some curious ghost stories, omens, warnings, &c., to which he appears to have attached considerable credit.

The pamphlet concludes with some good advice to the students, and good wishes for themselves, their friends, the university, and finally for mankind in general.

## Garden Memoranda.

Carhead, Yorkshire, the Seat of W. B. Wainman, Esq.—A fine specimen of the noble Dendrobe (Dendrobium nobile) is now in bloom at this place. It measures fully 5 feet in diameter, is graceful and elegant in shape, and promises to remain in beauty for some time yet to come. There also exists here a remarkable instance of the mildness of the season, in the shape of two Rhododendrons, which are now in full bloom in the open ground, where no protection whatever has been afforded them. The kinds are varieties of Nobleanum, from both of which beautiful trusses have been obtained for drawing-room decoration, from the first week in January up to the present time. *S.*

## Miscellaneous.

*The Bricklayer's Garden.*—But now for the "garden." The ground at the back of the house was levelled and enclosed by walls, in the shape of the house, as nearly as possible. It would have been a square by choice, but circumstances have caused it to be somewhat too long. In short, it is of that well-known outline, called a "strip," being, of all others, the most difficult to deal with for the picturesque or graceful laying out of a garden, even when the dimensions are of some extent; but when small, needing the greatest exercise of ingenuity to prevent ugliness and awkwardness, or the hardest lines that can offend the eye. But what is the gardener about? He has got a bricklayer's line, and is drawing it along parallel with the wall, for the formation of a long border, thus repeating the hard outline; and instead of carrying the eye away from it, or endeavouring to conceal it, he is literally forcing it into the most riveting attention. Gardener did I call him? —no, it is one of the bricklayers, assisted by a hodsman. Several cart-loads of mould are now brought into the garden, and shot down, and to work they go in "laying-out." Each strip of ground is separated from that belonging to the next house by a long wall. The wall of the first one is only half finished, and a bricklayer is at work upon the other side, while the gardening bricklayer on this side is laying down the mould for a border. Numerous pieces of broken and chopped off brick, with corresponding dabs of mortar, consequently fall over and are mixed up with the border mould, which the bricklayer on this side carefully buries, and then proceeds to make the border very fine on the surface. A path is next measured off by the bricklayer's line, parallel with the border, thus again repeating the sharp outline of the wall; and this path is covered with brick-rubbish and stones, and well trodden and beaten down, so that it would be no small trouble to change the form and direction of the path, if any tenant had the taste and moral courage to attempt it. By way of making this laying out perfect of its kind, a long central bed is now marked off, and covered with mould, parallel with the previous lines, and being an exact counterpart of the outline of the entire strip, only some sizes less. The gardening bricklayer manages his spade very assiduously, and neatly too, considering it is not his proper tool,—in fact, from his general handiness, I conjecture him to be an Irishman; and also, I must add, from his want of forethought: for this morning I perceive he is about to finish the top row of the wall bricks, to do which he stands on this side, thus trampling down all his fine surface of border-mould as he goes, besides strewing it all over with a second fall of fragments of brick and mortar. By night he has done. Next morning he is there again; not with his trowel, but his spade, carefully burying all the bits of brick and rubbish, and once more working the surface of the mould very fine to look at. Morning after morning have I watched these various operations during three months, and now, finally, I behold, a long row of new square brick-boxes, set upon damp clay—drained on an old and very bad system, and having in other respects, the most inconvenient arrangement—a succession of dust-holes close under the kitchen-windows, and in a line beneath the back dining-room window—and I am presented with a succession of some eighteen straight walls, enclosing straight strips of garden, each lined out by the bricklayer, in parallel lines, as a bricklayer naturally would do, and each one being the exact counterpart of the other. The whole set are made neat and sightly for letting, by the use of the broom to sweep out all manner of rubbish from the houses,—and the spade to bury it carefully in the garden beds and borders. Some poor woman, a bankrupt laundress, a servant-of-all-work out of place, or a charwoman with her family, is put in to "mind the house," and open the door to those who are looking out for a house. The rubbish and refuse she and her family will accumulate during her stay, perhaps of one month, perhaps of six, must not be thrown into the dust-hole, for that has to be kept tidy for letting; she therefore gets a man, or her husband when he comes home in the evening, to bury it "somewhere" in the garden. The extreme ends of these garden walls are met by the ends of other garden walls on the opposite side. I turn my gaze on them very often while sitting at my dressing-table, but gain little consolation from what I see. On this side, the outline of the garden walls is nearly the same as those I have been describing, and the laying out displays no better taste. Several of these strips are laid out in three round puddings of beds, one after the other, with the largest round pudding in the middle. Others have great beds made like aces of diamonds; three of them have made hard-favoured sets of little beds, like furrows cut across the whole width of the garden, with narrow walks between, like ruled copy books; and two of them have fairly given up the matter, and allowed the whole strip to lie like the fallow-field of rank grass, from which they were originally separated by the builder's walls. *Dickens' Household Words.*

*Sale of Plants.*—One hundred and sixteen lots of Camellias, together with a few Rhododendrons, Andromedas, and Araucarias, were sold the other day by Mr. Stevens. They fetched from 5*s.* to 30*s.* per lot, with the exception of one or two Double White Camellias, which fetched more than 2*l.* The latter invariably realized higher prices than any of the other varieties, though all of them were good sorts.

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

The generality of plants are now about to commence their new growth, and with the gradually increasing light, will require a proportionate increase of heat and moisture. Encourage their healthy development, by sufficient room, and by placing them as near the glass as circumstances will allow. Admit air enough at all times to ensure a circulation, and as much more as the weather renders necessary; but carefully avoid cold currents during the growing season. In repotting, be guided more by the state of the roots than by the tops, as the latter, when exposed to a disproportionate heat, are liable to start into growth without the roots progressing in a corresponding ratio; and they are, therefore, not so well prepared to take advantage of the new soil, as those whose roots are in motion. These last may be repotted with safety; and when the plants are passing through your hands for this purpose, let everything needful in the way of pruning, tying, or freeing them from insects be done, that the work may progress in the most economical manner. Before any plant is potted, the state of the soil should be carefully examined; and if the ball is dry, it should be soaked in a pail of water, not too cold; after which it should stand long enough to allow the superfluous moisture to drain away. A sowing should now be made of Thunbergias, Ipomœas, and other stove annuals, required for the decoration of the conservatory in summer and autumn; the two first, with others of a similar character, should be sown in 3-inch pots, two seeds in each, and the rest in ordinary seed-pans; the whole should be plunged in a hotbed, and shaded till they make their appearance above-ground. As the majority of plant-houses are better adapted for small and moderate-sized plants than for large ones, and as the same description of plants is most generally useful for placing in ornamental china vases in the drawing-room, &c., it is important that at this season a young stock be raised of all the choice things that are ornamental and interesting as small plants. And this matter should be particularly attended to with reference to such as will be useful next winter; of a few of these we subjoin a list. Euphorbia fulgens, Gesnera elongata, Manettia bicolor, Begonia nitida and B. insignis, Abutilon venosum, Poinsettias, Polygalas, Francisceas, Tremandra verticillata, and T. Hugelii, &c. Such well-known favourites as Chrysanthemums, Cinerarias, Primulas, &c., will suggest themselves to every one. All plants of which it is desirable to increase the stock should be propagated as soon as they make shoots fit for the purpose; these should be watched, and slipped off with a heel when 2 or 3 inches long, as they will strike with great facility in that stage if placed in a temperature resembling as nearly as possible that in which they have been grown; taking care to keep them close, to shade them from sunshine, and to guard them against damp, or excessive dryness. If the young plants of the various kinds of Ipomœa are liberally treated

with pot room and a strong moist heat, they will be useful in the autumn for placing in the conservatory. Few things are more attractive when well managed; and as they may be preserved in any warm shed during winter they are not much trouble.

FORCING DEPARTMENT.

Perhaps nothing is more worthy of notice in this department, at the present period, than that one of the greatest errors committed by the forcing gardener is to allow too few leaves and too much fruit to remain upon Vines. It is impossible to lay down any rule for others to go by in this matter; but we would rather reduce the number of bunches upon a Vine of moderate vigour to six, and have these fine, than have twelve indifferent bunches, if the Vine was likely to be injured by them. An old but healthy Vine will bring a great number of Grapes to the best perfection, while a young Vine will be injured for years, by being allowed to carry one or two bunches too many. In the first place, the spurs should be limited to a number which will allow of their leaves being freely exposed to the influence of the sun and air; and of this number not more than half should be allowed to produce fruit this year, nor should any one of these be allowed to mature more than one bunch. The remaining half of the spurs ought to be confined to making wood for next year's crop. Weak spurs, which are not to bear fruit this season, should be encouraged, by allowing them to produce six or eight leaves before they are stopped; this practice will be particularly useful with Vines, which are weakly from excessive cropping last year, or from other causes. To expose the foliage as much as possible to the action of light, the spur shoots should be tied at right angles with the main rods. Any plants in pots, under the Vines, will by this be much shaded; but if your Grapes be the chief object, other considerations must not be allowed to interfere with whatever is necessary for their perfect development. PEACHES.—In disbudding Peach trees, it is desirable to retain as many of the side or even foreright shoots as will fill with leaves any part of the tree which would otherwise be bare; all the young shoots so retained, with the exception of those required for laying in, should be stopped above the third or fourth leaf, as in spurring. By this means, the appearance of the trees will be improved, and a supply of fruit-bearing spurs secured, where there would otherwise be nothing but naked wood; and if at any time it be found necessary, they will be available for the production of young wood, to fill up where old, worn out branches have been removed. We have generally found the largest and finest fruit in our Peach houses upon these spurs; and sometimes on those situated very near the main stem of the tree. Constant attention must be paid to tying in the young shoots nearly parallel with those from which they proceed, as, on early attention to this matter, much of the beauty of fan-trained fruit trees depends. Strawberries are very liable to be attacked by the green fly, for destroying which, recourse must be had to smoking or fumigating. If any pot plants are growing in the forcing houses, they should be closely watched, for in nine cases out of ten they bring mischief along with them. It is very necessary to nip all these plagues in the bud, as by so doing much labour is saved, and the disappointment consequent upon the unchecked ravages of insects is avoided.

FLOWER-GARDEN AND SHRUBBERIES.

If the soil of any of the beds or clumps for masses has not been prepared for its summer occupants, it should be immediately done. Where a certain kind of plant suits a particular situation, there is no impropriety in placing it there every year; but in such cases it is advisable to remove the whole, or a large portion of the old soil, once in two or three years, and to fill up with new material. For some plants, however, as scarlet Pelargoniums, this practice would be injurious, unless the soil were very poor, for they generally grow too luxuriantly. Our situation being moist, and the growth of Geraniums, consequently, being often too vigorous, we beat or tread the bed firmly, and then in planting, lay the plants on the hardened surface, and cover them with light soil. By this means, our plants are entirely covered with flowers. Pay every attention to the propagation of the more excellent bedding plants, preferring those which combine a compact habit, and hardy constitution, with a decided colour. Dwarf, compact, blue beds will be best furnished by the different varieties which have originated from Lobelia gracilis; and which may be increased with great facility by cuttings or seeds. The latter should be sown immediately in boxes or pans, and pricked out into a frame of soil, as soon as they are large enough to handle. The best variety is the L. Erinus compacta grandiflora, than which a more beautiful plant for dwarf dense masses of a deep blue, or violet colour, does not exist. For a taller bed of pale blue, the Ageratum Mexicanum might answer; and for a purple bed the purple variety of Branching Larkspur is a most desirable thing; and in damp situations, where many other things would prove a failure, nothing excels, as a pale blue, the late-flowering Forget-me-not (Myosotis scorpioides). Verbenas will supply beds of all shades and colours; except yellow and good blue; but the greater portion of the varieties in cultivation are too diffuse in habit to make compact effective beds. If about a dozen of the most distinct, free-flowering, compact-growing kinds are selected, the rest may be very conveniently discarded. For white beds, one of the best and most satisfactory of flowering plants, is Verbena Mont Blanc; and next to this, we may mention, the varieties of Pelargoniums with variegated leaves, the Lobelia Erinus compacta alba, and the variegated Alyssum; the latter planted thickly, answers the purpose very well, as the flowers and leaves are both white. The white flowering Geraniums are not yet perfect, but we have every reason to believe that by attention to hybridizing, we shall soon have them everything that can be desired. Get the fancy varieties of Pelargoniums as strong and bushy as possible previous to planting out, so that they may begin to bloom evenly. They all flower in such abundance, that there is little doubt of their continuing to make a good display throughout the season, particularly if the soil is light. Sandy peat, a little loam, and leaf-mould, suit them best.

FLORISTS' FLOWERS.

The season almost puzzles the oldest florists; we have Tulips far advanced above-ground; they consequently must be carefully sheltered from the dry cutting winds of March. This can easily be effected by some of the nets advertised in our columns. A slight protection will now prevent extensive mischief, and a little trouble will be worth the while; for we learn that the Great Northern or the Great Midland (the last we believe is the appropriate designation), is offering very handsome premiums for the Queen of flowers. Therefore those of our friends who mean to win must begin their care now.—Plant Ranunculuses. The beds of course are prepared according to our previous directions. We recollect one of the best blooms we ever saw was grown on a bed that had been previously well trampled, and when the bulbs were pressed on the hard surface and covered over, the surface of the bed was beaten by the back of a spade. Give Auriculas plenty of air at all times, provided the air is not too cold, for a check at this season is highly detrimental. Begin to make active preparation for potting off the stock of Carnations; the soil ought to be under a shed, well worked, and a sixth part of peat charcoal, whether Irish or English, will be found highly beneficial.

State of the Weather near London, for the week ending Feb. 27, 1851, as observed at the Horticultural Garden, Chiswick.

## Notices to Correspondents.

A FIELD: *Constant Reader*. You should put yourself in communication with one of the great London seed houses, and contract with them to grow whatever they would like to have saved in your field, which seems to be very favourably placed for a crop which requires nicety in saving it.

ARAUCARIA: *J H*. The bleeding cannot be stopped, nor can we judge the cause. There is nothing that you can do except wait the worst with hope or resignation.

CAMPANULA VIDALII: *G*. This is a fleshy-stemmed straggling shrub, with good-sized cream-coloured flowers, said to grow two or three together at the end of a long stalk. What it may be worth will be seen hereafter: we do not expect much from it.

CINERARIAS: *Ignoramus*. Flora M'Ivor, brilliant crimson; Lady Gertrude, dark blue; Nymph, white; Cerito, white, with a lavender edging; Climax, clear white, with a crimson edging; and Edmondiana, white, with a blue edging.*

CLUB IN CABBAGES: *Tamworth*. The usual remedy is to put wood-ashes into the holes in which the Cabbages are planted. An article on the destruction of wireworm will be found in another column.‡

COLOURS: *C E G*. There is a certain sort of truth in the assertion that pure blues and pure yellows do not coexist in the same genus of plants. For instance, you have no blue Ranunculus or Dahlia. But, on the other hand, exceptions abound, as in Salvia and Hyacinths, which contain both blue and yellow colours. Fortune's yellow Salvia did not reach England alive.

CONIFERS AND CATTLE: *E*. We are not aware that the Cedar of Lebanon, or the Deodar, has proved injurious or poisonous to cattle; but any Coniferous tree is likely to disagree with them if they eat it.

CRATÆGUSES: *Constant Reader*. All are handsome; the best are the varieties of oxyacantha, Aronia, Constantinopolitana, nigra, cordata, tanacetifolia, odoratissima, and orientalis. Trust to a respectable nurseryman. And so of the Belgian Azaleas; it is of little use to order them by name; a respectable nurseryman will make a better selection for you than you can yourself.

FIGS: *M B*. The sort of Fig most cultivated at Argenteuil is the Blanche ronde. With regard to disbudding, the terminal buds of all shoots above 6 inches long, with the exception of that of the leading shoot, are removed when the trees are uncovered in spring; and likewise about the half of the wood buds along these same shoots ‖

FORCING: *An Old Sub*. No plants can flower well till they have made good roots; that is the first thing to look to, and is true of every case. After forcing Ghent and other Azaleas it is better to turn them out and grow them in the open air for a clear year before forcing them again. In forcing them and all other things proceed slowly; haste ruins everything. They ought to be a month after their buds swell before the flowers open, if the flowers are to be fine and to stand well. Roses are forced every year; but they are also well grown and well rested every year. All plants *must* have rest, unless you wish to kill them; none demand this more than Chinese Azaleas in pots. Manure should be applied to plants in pots only while they are making their growth; while at rest it does no kind of good, and may do much harm. You must kill green-fly with tobacco smoke.

GARDENER IN PARIS: *W*. Such a person could be easily found, but not for such wages. Living is as dear near Paris as near London, and here the minimum wages for such a gardener would be 80*l*. a year. We are afraid it will be difficult to induce men to go abroad for *less* than they receive at home.

GARDEN MEMORANDA: *H M*. We never allow any one to write these except our own reporter. Your statement is an advertisement——and something more.

GLASS: *J Redwood*. Hartley's patent rough plate. The Black Hamburgh Grape will possibly suit your purpose best.‡

GOLD FISH: *Horatio*. These spawn exactly like other fish, and it is important that they should have weeds and gravel among which to deposit it.

HEATING: *Inquirer*. In distributing heated air, it may be convenient to have more openings than one; but no general answer can be given to such inquiries. What it may or may not be desirable to do depends upon a variety of delicate considerations, which vary with plans, objects, and circumstances.

HEBBABIA: *Hortus Siccus*. If you wash your dried plants in a weak solution of corrosive sublimate in spirit, they will not become mouldy.

INSECTS: *J P S*. The small white grubs in the interior of the Wheat stalks are the young of the Wheat-fly (Chlorops lineata), of which a full history is given in this work for 1848, November 25 and December 2. We believe it is not decidedly injurious to the plants. *W.—G T W*. The grubs found under-ground are the small larvæ of the common cockchaffers. Turn a lot of ducks into the field. *W*.

LILY OF THE VALLEY: *T G B*. You will find the cultivation of this in such books as Loudon's "Encyclopædia of Gardening." What it wants is well drained soil, and plenty of dead leaves, rotten sticks, &c., among which to run about—just what it gets in its native woods. It dislikes to be buried deep. You may trap the woodlice with pieces of Potato, or destroy them by toads; but it requires perseverance and patience.

MULBERRY TREES: *Sub*. We never saw Mulberry trees planted under glass, and trained against the back wall of a late hothouse; but we see no reason why they should not be so treated, if they are worth the situation.

NAMES OF FRUITS: *F H L*. We cannot pay the carriage of articles sent for names; 2*s* 8*d*. were demanded by the Dublin Steam-boat Company, who have the box.—*X Y*. No. 1 you say is not so large as the Court of Wick; this is probably owing to the state of the tree, for it appears to be nothing else. 2, quite worthless; one would suppose it had been produced by the stock. 3, Grange's Pearmain. 4, worthless; resembles the American Sops of Wine.‖—*J J*. The Flemish Bon Chretien.‖

NAMES OF PLANTS: *J W*. Schomburgkia rosea, and Maxillaria scabrilinguis.—*J P*. 1, nothing but Centaurea nigra with white flowers; 2, Juncus obtusiflorus; 3, Lycopodium clavatum; 4, Myosotis palustris; 5, Trifolium fragiferum; 6, Stachys sylvatica.—*R E*. After a long search we are unable to find any trace of the Maxillaria-like plant; but it is not in a state which will permit its being named and published as new.—*M A G*. Erica herbacea; the taller is perhaps E. mediterranea very young. Bud Orange stocks either now or in autumn as soon as the bark will run; but take care that the buds are quite ripe.—*J S C*. Barbarea vulgaris, the common Belleisle or broad-leaved Cress.—*A Reader*. Apparently a flower of Iris reticulata.

PAWLOVNIA: *Gallicus*. There is no reason why it should not be moved, but there is no time to lose. It requires a hot dry place, and if you can give it a berth where the soil *burns* in summer, so much the better. It will bear much more cold than you ever have, but will not flower unless you can prevent exuberant growth and ripen its wood well. We believe no one has yet tried training it to a south wall.

PINE APPLES: *Amateur*. You should have stated the age of the Pines from which you wish to have ripe fruit in May, June, and July; and the temperature at which they have been kept during winter. "Starting" them, as you propose, is not so good as *growing them without check until they fruit*. Let the temperature be about 60° by night, and from 70° to 85° by day, with a bottom heat of from 80° to 85°. Any fruit that may come up in March will be ripe in June and July; but to have ripe Pines in May, the fruit should now be set and swelling.‡

RHUBARB: *J C*. The sample of Rendle's Prolific was very good, solid, and well flavoured. About its earliness we have no personal means of judging.

ROOKS: *M P* asks for information concerning the best means of persuading rooks to build in trees. Answers have occasionally been given to this inquiry, but our correspondents seem desirous of further information.

SCALE: *Sub*. The best remedy for it is hot water. You may apply it to Vines in a dormant state at a temperature varying from 140° to 160°.‡

STEAM-CUT SASH-BARS: *Amateur*. Mr. Montgomery, of Brentford.

STOVES: *W Br*. We do not perceive the connection between Cundy's stove and horticulture.

VINEGAR PLANT: *M A*. This is the spawn or mycelium of Penicillium glaucum. These substances are figured in Lindley's "Medical and Œconomical Botany," p. 17.

VINE S: *W W*. Your mixture will answer perfectly. Apply it with a painter's brush.‡

WAGES: *M P*. A master is not justified in withholding the wages of his gardener, earning 21*s*. a week, in the event of such gardener being temporarily disabled by illness from working; a labourer earning 7*s*. a week stands in a different position, not being a domestic servant.

WALL TREES: *B L*. Nail them up at once, or they will be caught by the frost while you are thinking of doing the work. Cannot you weave a few Birch twigs or something of the sort amongst the flowers of the earliest kinds. It is a bad plan on every account to leave the fruit shoots unnailed at this time of year. Blossoms close to a wall are not so likely to be cut off as those which are loose and unprotected in front of it.

WILLOWS: *Salix*. We are corrected by the following memorandum. "The Huntingdon Willow is the Salix alba of Linnæus, according to Selby's 'Forest Trees' and Loudon's 'Arb. Brit.' ch. ciii. p. 1522, there quoted. *S. S.*"

SEEDLING FLOWERS.

CINERARIAS: *F P E*. Both well worth growing; but not sufficiently distinct to be sent out as new varieties.*

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PURCHASERS OF AGRICULTURAL SEEDS are recommended to peruse Messrs. SUTTON'S New Price List, which appears *in the last page of the present Number of the Gardeners' Chronicle.*

The advantages Messrs. SUTTON are enabled, by their extensive trade to afford Agriculturists *in supplying genuine home-grown Seeds at the low prices therein quoted, and free of carriage,* will doubtless be appreciated in these times of economy and agricultural improvement.

THE SKINLESS CHEVALIER BARLEY.—The valuable malting properties of this Barley, and the handsome appearance of the grain, are as superior to the Peruvian Skinless Barley as the finest Wheat is superior to Rye. Messrs. SUTTON have but a limited quantity; therefore, to prevent disappointment, it is requested that those of their friends who wish to try it will apply early for the Seed. Price 5*s.* per peck. Samples may be had by post, by enclosing two postage stamps. *See* Messrs. SUTTON'S *Advertisement in the last page of the present Number of the Gardeners' Chronicle.*

EXHIBITION OF CAMELLIA JAPONICA.

A COLLECTION OF THESE BEAUTIFUL EXOTICS is now in bloom, at CHANDLER and SONS' Nursery, Vauxhall. Admittance gratis.

EARLY ALBION KIDNEY POTATO.

EDWARD MITCHELL having a surplus stock of SEED POTATOES of this first-rate early variety, begs most respectfully to offer them to the public, and the trade generally, as being one of the very best and earliest varieties grown, it being full three weeks earlier than the Ash-leaf or Walnut-leaf Kidney Potatoes; also a greater cropper, and far superior in flavour, than any other variety grown. Price, per bushel, 8*s.*, with the usual discount to the trade.

EARLY COLCHESTER. — A round variety, of superior quality, as early as the Early Frame, but a more prolific cropper, and of first-rate flavour. Price 6*s.* per bushel, with the usual discount to the trade.

Post-office orders are expected from unknown correspondents.

Bristol Gardens, Kemp-town; and 55, Marine Parade, Brighton.

TWELVE EXTRA FINE DOUBLE BALSAMS—Striped, Spotted, and Selfs, in sorts, 2*s.* 6*d.*; mixed packet, 1*s.* 6*d.* or 5*s.* per oz. 12 Superb Double Hollyhocks, in sorts, 2*s.*; mixed, 1*s.* 12 sorts of first-rate Melons, 5*s.* Ultra Crimson Phlox Drummondii, and new Carmine 10-week Stock, 6*d.* per packet. The most popular and approved Border Annuals, including Asters, Lupins, Stocks, Larkspurs, &c. &c., 30 packets for 2*s.* 6*d.*, or 60 for 5*s.* All post free.—Enclose stamps or money order to WILLIAM JONES, Florist and Seedsman, Stoke Newington-road, London.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND CO. beg to notice their mixtures of GRASS SEEDS for Laying Land down to Permanent Grass, are now ready for delivery. They have reduced the price to 30*s.* per acre, allowing 2 bushels 12 lbs. to the acre.

Mixed sorts for improving old Grass Land, 1*s.* 2*d.* per lb.

Fine sorts, for forming Lawns, 1*s.* 3*d.* per lb. Directions for sowing will accompany the Seeds.

GEORGE GIBBS and Co. will feel happy in sending general priced Catalogues of Agricultural and Garden Seeds, on application to 26, DOWN-STREET, Piccadilly, London.

MESSRS. HAY, SANGSTER, AND CO. will be ready to supply their prepared POTATO CUTTINGS about the middle of April next, the produce of which proved so highly satisfactory last, as well as the experimental trials of the three former years, as to QUALITY, QUANTITY, and SIZE, being more than double the crop this year of those planted in the usual way, and containing a much larger quantity of starch, which is so essentially necessary to the preservation of that valuable root. A report of the analysis will be found below. Our own experiments give about one-third more saccharine matter than the best we could procure grown under the old system. All orders must be to hand on or before the end of the second week in April, as H. S. and Co. are preparing to plant a large breadth, and will only provide for what may be ordered up to that time. Post-office orders to be made payable to JOHN SANGSTER, at the Borough Post-office, Southwark. Printed instructions for planting and management will be sent with the plants ordered.

MAURICE SCANLAN, F.C.S., Chemical Works, George-street, Bermondsey; ALFRED ANDERSON, F.C.S., Experimental Chemist, Great Suffolk-street, Southwark.

EDWARD GEORGE HENDERSON, Wellington-road Nursery, St. John's Wood, London, begs to offer the following New Plants:—

NEW FUCHSIAS.

| | *s.* | *d.* |
|---|---|---|
| PRIME MINISTER (HENDERSON'S), bright glossy crimson sepals, short and good tube, crimson purple corolla, good habit. A handsome well reflexed variety, that will give much satisfaction ... ... ... ... | 7 | 6 |
| RESPLENDENT (HENDERSON'S), glossy crimson sepals, short stout tube, rosy purple corolla. A handsome well-reflexed variety, of first-rate habit, and most desirable ... ... ... ... ... ... ... ... | 7 | 6 |
| LORD OF THE ISLES (HENDERSON'S), a very large and handsome dark variety, of stout substance, and very distinct from the above ... ... ... ... ... | 7 | 6 |
| MADAME SONTAG (HENDERSON), beautiful waxy white, short tube and sepals, which are thrown quite back, exposing a rosy crimson partially expanded corolla, the base of which is clear white; good substance and good habit ... ... ... ... ... ... ... | 7 | 6 |

E. G. H. recommends the above Fuchsias with perfect confidence, as being marked improvements on all that have been sent out.

NEW SCARLET GERANIUM.

| | | |
|---|---|---|
| BEAUTY OF THE PARTERRE.—This is one of the best and most distinct varieties yet introduced, possessing handsome marked foliage. The colour is bright salmon, and quite different to any other Geranium yet sent out, from its very dwarf and compact habit, rendering it a very attractive variety; and as it blooms in masses, it will be valuable for bedding or other purposes ... ... ... ... ... ... ... | 10 | 6 |

NEW VARIEGATED SCARLET GERANIUMS.

| | | |
|---|---|---|
| PEACH-BLOSSOM.—Leaves large, like "Flower of the Day." Flowers salmon-colour, good form, and a very free bloomer ... ... ... ... ... ... ... | 10 | 6 |
| BRIDAL BOUQUET.—Leaves very clear white, with green centre; better in colour than the other; dark crimson scarlet flower, and a very free bloomer ... | 10 | 6 |

E. G. H. has also much pleasure in introducing the two following beautiful

NEW POTENTILLAS.

| | | |
|---|---|---|
| BICOLOR GRANDIFLORA.—Golden yellow, with broad scarlet margin, a very handsome variety, and the largest of all the Potentillas ... ... ... ... | 5 | 0 |
| ANTWERPENSIS.—Brilliant orange, dwarf habit, and being semi-double, does not close in the evening. Very fine, and continues blooming from May to Nov.... | 7 | 6 |

All the above will be ready for sending out the last week in April.

NEW GREENHOUSE CLIMBER.

| | | |
|---|---|---|
| HARDENBERGIA OVATA ALBA.—Clear white, and blooms freely; a very handsome variety. Plants now ready ... ... ... ... ... ... ... ... ... | 15 | 0 |

NEW STRAWBERRIES.

| | | |
|---|---|---|
| PREMISSES DE BAGNOLET.—A very large and excellent flavoured fruit, remarkable for its lateness. Highly recommended. Good established plants in pots, each ... ... ... ... ... ... ... ... ... | 1 | 0 |
| CREMONT'S PERPETUAL.—A new double-bearing Strawberry, of superior quality, strongly recommended by the National Horticultural Society of France, who appointed a committee to inquire into its merits, and awarded it a special medal. Dr. Lindley also refers to it in the *Gardeners' Chronicle* of Nov. 9, 1850. Good plants, each ... ... ... ... ... ... ... ... | 2 | 6 |

E. G. H. has also strong plants now ready of the following New Fancy Geraniums and Cinerarias, which he highly recommends:—

NEW FANCY GERANIUMS.

| | *s.* | *d.* |
|---|---|---|
| BLACK PRINCE (HENDERSON'S), fine rich dark maroon (upper and lower petals same colour), slightly margined with rose, light centre; a free bloomer, good habit and distinct ... ... ... ... ... ... ... ... | 10 | 6 |
| MARION (HENDERSON'S), upper petals rich crimson with clear white margin, lower petals clear white with belt of bright rose, white centre; a good dwarf close habit and an abundant bloomer, and continues flowering in perfection the whole season ... ... ... ... ... | 10 | 6 |
| PRIMA DONNA (HENDERSON'S), upper petals dark crimson purple, shading off in veins to a light edge; lower petals blotched and pencilled, having a striped appearance; a good trusser, free bloomer, and retains its flowers for a considerable time ... ... ... ... | 10 | 6 |
| PRINCE ALBERT (HENDERSON'S), upper petals deep crimson velvet with clear white margin; under petals white, blotched and veined with violet; a large flower, very constant, and a free bloomer ... ... ... ... | 10 | 6 |
| REINE DES FLEURS (HENDERSON'S), clear white ground with intense violet plum blotch and broad belt of white; lower petals white, slightly marked with rosy purple; good form and a free bloomer ... ... ... ... | 10 | 6 |
| EXQUISITE (HENDERSON'S), a fine clear smooth-edged flower; upper petals blotch of lilac with deep belt of bright rose, margined with white; under petals marked with rose; a nice compact trusser, good habit and an early bloomer ... ... ... ... ... ... ... ... | 10 | 6 |

E. G. H. having himself raised and proved the above new fancy Geraniums, can therefore with the greater confidence recommend them as being perfectly distinct in themselves, as well as from any other varieties in cultivation. They are also excellent growers and free bloomers.

E. G. H. will also have the following new Pelargoniums to send out at the same time, viz:—

| | *s.* | *d.* |
|---|---|---|
| CORA (raised by an amateur seedling grower), orange scarlet, white centre, moderate size; a remarkably early blooming variety ... ... ... ... ... ... | 7 | 6 |
| FIREBALL (HENDERSON'S), a beautiful rich crimson scarlet, centre violet shading to white (a decided improvement on "Salamander") ... ... ... ... ... | 10 | 6 |
| PRINCESS ROYAL (HENDERSON'S), light purple under petals, black velvet upper petals, with small regular deep red margin; fine truss ... ... ... ... | 7 | 6 |
| STANDARD BEARER (raised by an amateur seedling grower), a fine bold flower; upper petals rich orange crimson; under petals bright salmon; excellent habit and free bloomer ... ... ... ... ... ... | 10 | 6 |

CINERARIAS.

| | | |
|---|---|---|
| AMY ROBSART (E. G. HENDERSON'S), lilac rose, self, dark disc; fine form ... ... ... ... ... ... | 7 | 6 |
| CLARA MOWBRAY (E. G. HENDERSON'S), ruby carmine, with black disc; large flower and novel colour ... | 7 | 6 |
| DELICATA (E. G. HENDERSON'S), white and bright lilac, equally divided; dwarf habit and a most abundant bloomer ... ... ... ... ... ... ... | 7 | 6 |
| EFFIE DEANS (E. G. HENDERSON'S), white deeply edged with dark purple, dark disc; good habit ... ... | 7 | 6 |
| FAIRY QUEEN (E. G. HENDERSON'S), white ground with an edging of light rose; large flower and good habit ... | 7 | 6 |
| *LADY HUME CAMPBELL (E. H. HENDERSON'S), the purest white ground we have ever seen, with a bright purple blue edging: excellent form and habit; first rate | 10 | 6 |
| *MADAME SONTAG (E. G. HENDERSON'S), beautiful clear white, with deep edging of porcelain blue, dark disc, dwarf and excellent habit: fine form ... ... | 10 | 6 |
| MARGARETTA (E. G. HENDERSON'S), dark blue purple self: a moderate-sized and well-arranged flower; free bloomer ... ... ... ... ... ... ... ... | 7 | 6 |
| LADY ARAMINTA (E. G. HENDERSON'S), blue, with a circle of violet crimson round the disc: dwarf habit and well-arranged flower (gratis to purchasers of the set). | | |

E. G. H. is now sending out the above set (with the exception of the two marked thus *, "Lady Hume Campbell" and "Madame Sontag," which cannot be sent out until the spring.) Purchasers ordering the set will have their names put down for plants of those two beautiful varieties for spring, as the stock is limited.

E. G. H. also calls attention to the following new and choice

FLOWER SEEDS.

| | Per packet. | *s.* | *d.* |
|---|---|---|---|
| Choice Calceolaria, from best named flowers ... ... | | 5 | 0 |
| Ditto Cineraria ditto ditto | 2*s.* 6*d.* and | 5 | 0 |
| Ditto mixed Primula sinensis ... ... ... ... | | 1 | 0 |
| Escholtzia alba, a handsome new white biennial ... | | 2 | 6 |
| Campanula Vidalii, a new species from the Azores; grows 2 feet high, compact shrubby habit, with numerous spikes of pure white flowers; valuable for bedding or pot culture ... ... ... ... ... ... | | 2 | 6 |
| Ipomœa rubro cœrulea ... ... ... ... ... ... | | 1 | 0 |
| Grammanthes gentianoides, new ... ... ... ... | | 1 | 0 |
| Eucnida bartonicides, yellow, new ... ... ... ... | | 1 | 0 |
| Schizanthus retusus albus ... ... ... ... ... | | 0 | 6 |
| Cobœa scandens, new seed ... ... ... ... ... | | 0 | 6 |

Imported German Stocks and Asters, in collections.

Geranium "Flower of the Day," 7*s.* 6*d.* and 10*s.* 6*d.*

Dry tubers of Achimenes longiflora alba, to flower this year, post free, 2*s.* 6*d.* and 3*s.* 6*d.* each.

N.B. Catalogues of Seeds and Plants, post free on application.

SUPERB RANUNCULI.—The present being the usual month for planting the Ranunculus, we beg to recommend the following selections.

*The new varieties have been selected with great care, of first-rate sorts, from immense quantities of seedlings, and for vigorous growth and free flowering are far preferable to the older varieties. Selections, in strong roots, at the following reasonable charges, with printed instructions for planting and treatment.*

| RANUNCULUS.—*Free by post.* | £ | *s.* | *d.* |
|---|---|---|---|
| 50 Splendid new varieties, with names ... ... | 2 | 0 | 0 |
| 25 do. do. do. ... ... | 1 | 2 | 6 |
| 100 do. varieties from new and other best named sorts ... ... ... ... ... ... ... | 3 | 10 | 0 |

| Floribundus, 2*s.* 6*d.* p. doz. | 0 3 | Vernalis Spicatus ... | 1 6 |
| Gandavensis, 5*s.* p. doz. | 0 6 | | |

Copies of our Autumn Root Catalogue may still be had.

Remittances required from unknown correspondents.

BASS AND BROWN,
Seed and Horticultural Establishment, Sudbury, Suffolk.

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

SALT for Agricultural Purposes, Asparagus Beds, Garden Walks, &c., &c., price 23*s.* per Ton, delivered in Sacks to any Railway Station in London. Sacks to be paid for or returned. Apply to JOHN MEREDITH, Salt Merchant, 10 Wharf, City-road Basin, London. N.B. Rock Salt.

FARM IN HAMPSHIRE.

TO LET, a Good STOCK FARM, of about 434 acres, of which 24 acres are Water Meadow, 55 acres dry Pasture, and the remainder Arable. The Poor Rates are very low, and the Tithe amounts to about 4*s.* 6*d.* per acre. The Farm adjoins the Great London Road, and is four miles from the Andover Road Station. No applications will be received unless accompanied with satisfactory references.—For particulars, apply to Mr. HUGH RAYNBIRD, Laverstoke, Andover Road, Hants.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

# The Agricultural Gazette.

*SATURDAY, MARCH* 1, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
WEDNESDAY, March 5—Agricultural Society of England.
THURSDAY, — 6—Agricultural Imp. Soc. of Ire.and.
WEDNESDAY, — 12—Agricultural Society of England.
THURSDAY, — 13—Agricultural Imp. Soc. of Ireland.

WE have not yet directed that attention which they deserve to the experiments of Mr. THOMPSON, and the researches of Mr. WAY upon THE ABSORPTIVE POWERS OF SOILS. The truths ascertained by these gentlemen are certainly of the very highest importance to agriculture. In ignorance of them many of the more striking facts of every-day observation by the farmer seem impossible of explanation. Take, for instance, the increasing fertility of well managed land in the face of an annual washing by from 2000 to 5000 tons of water per acre. Every year our soils are washed by a quantity of rain equal to a depth of from 2 to 4 feet of water over their whole surface, and much of this of course penetrates the earth, and is carried, with all that it has taken, by the rivers to the sea. Fertility is for the most part an altogether quantitative affair; and it is upon the quantity of certain *soluble* matters in the soil that it is dependent; and yet, notwithstanding this annual washing, our soils retain and even increase their productiveness. Take also the fact that spring water is not always, nor indeed ever, a saturated mineral or other solution. Springs exist of uniform productiveness throughout the year, notwithstanding the extremely irregular character of our annual rain-tables; and, considering how heavy falls of rain fail to exert any immediate influence upon such springs, we may say of them, the water which is being yielded by them *now* must have fallen from the sky many weeks ago; and yet, with all the wonderful powers of solution which rain-water is known to possess, exerted during the whole of that long interval throughout the whole tedious journey from the spot on which it fell to that from which it has again issued to the light, the water has failed to saturate itself with the spoils of the territory it has traversed. Ammoniacal salts existing in the soil before the rain, exist

there after it also—they are not found in our spring waters; and even the water of our drains yield but a small quantity of a few mineral salts to the reagents of the analyst.

This fact has been ascertained to be true, in the case of certain selected salts and certain specimens of soil placed in glass tubes for the purpose of experiment. Solutions of the carbonate and sulphate of ammonia are found by Mr. THOMPSON to yield most, and in some cases all their ammonia, in traversing 6 inches of soil. Light sandy loam, black vegetable mould, and strong clay soil, were used. And the only exceptional case was where a strong solution of the carbonate of ammonia was used over the vegetable mould. The general result convinced Mr. THOMPSON that either sandy, clayey, or black vegetable soils, possessed the power of retaining a much larger amount of ammoniacal salts than they received in the most liberal manuring. The practical inferences he drew from the inquiry were as follows:

1. That clay soils might be manured a considerable time before sowing without loss.

2. That light shallow soils should not be manured long before sowing; should not be heavily manured at one time; and that the manure should be kept as near the surface as practicable without leaving it uncovered.

3. That it is desirable to deepen the cultivated soil of all light land, as it then gives it a greater power of holding manure.

Some of these inferences, it will be observed, already had a place in the minds of all intelligent practical farmers; others, if found practically sound, would justify the adoption of an altered and often more economical management of manure.

Mr. WAY, unacquainted with Mr. THOMPSON'S experiments, had his attention directed by that gentlemen, and by Mr. HUXTABLE, to this subject, in 1848, and has since prosecuted a most successful inquiry in connection with it. The results being published in the last volume of the "English Agricultural Journal."

Solutions of various strength of caustic ammonia, carbonate, sulphate, nitrate, and muriate of ammonia, were passed through columns of soil, ferruginous, calcareous, clayey, sandy, dried, moist, burned, through white sand, and plastic clay; through burnt clay, as brick-dust and powdered tobacco pipes; through soil altogether destitute of vegetable matter, and through soil containing vegetable matter; and the results from the 42 experiments which the research included, indicate the existence of a power in the soil, which appears to reside in the clayey ingredient of removing ammonia from its solutions, and even from its acid combinations, and retaining it, notwithstanding the passage of water, so powerful a solvent of it, through the medium containing it.

But Mr. WAY'S experiments related to potash and soda, both caustic and as carbonate, muriate, sulphate, and nitrate, as well as ammonia, and here, too, he found that the soil employed removed the alkalies from their solutions. Its power over solutions of lime, magnesia, and phosphoric acid, was also sought for and found. And besides this piecemeal investigation of the subject, experiments were instituted which any one can readily perform for himself, for the purpose of ascertaining the effect of the soil upon putrid tank-water, town sewerage, and other liquids more nearly approaching to the solutions of manure in freshly dressed land; and it was found that a few inches of any soil containing a certain proportion of clay, was able to remove all taste and smell; and, therefore, of course, all those volatile ingredients to which their taste and smell are owing.

Mr. WAY deduces a number of "practical conclusions" from his valuable investigations, relating chiefly to the importance of claying sandy soils, to the safety of using liquid manure, even on lands unoccupied by a crop, to the advantages of comminution and perfect tillage of the land, and to the indifference, in reference to ammoniacal salts, as to which of these be used, so long as the requisite quantity of the base be present. Of these the safety and economy of the use of liquid manures, even in the winter season, to fertilise the soil against the period of growth, appears to be practically the most important; and it will, no doubt, be extensively put to the test ere long. It seems very desirable that Mr. WAY'S paper on this subject should have an independent and separate publication. If republished as a pamphlet, it would, we are sure, have an extensive circulation.

## ON THE TULLIAN CULTIVATION OF LAND.

No. I.

INASMUCH as our markets are, and probably will be, continuously near the continental and transatlantic level of prices, free trade must for a time seriously affect the farming interests, and this will continue to be felt more stringently and longer by those who were previously embarrassed, or who from having had too limited capitals, found their land in a state that precluded an immediate increase in its productiveness; this has been much more general in Ireland than in either of the sister kingdoms, for here there has ever been a very great and common deficiency of agricultural capital, and, in addition to the deterioration in the price of agricultural produce felt by all, the disease in the main-stay crop of the country came to augment the difficulties of the crisis; for the larger part of our income was derived from the export of our grain, which the Potato enabled us well nigh altogether to dispense with. This income has been for the last six years all but annihilated, for though still an exporter of our own grain we have been a very large importer of foreign grain (Maize), the meal of which retailed in our inland markets at 2*d*. a stone lower than our oatmeal, is almost the exclusive food of the humbler classes; Potatoes, from their high price, having become unattainable by them, and even a luxury in respectable houses.

I must think it lamentable that means could not have been devised to let us down more easily. The chief obstacle in our way to meet a lessened value by an increased produce is the want of capital; this might have been foreseen, and the deficiency supplied by banking accommodations, extended beyond the time suitable to the trading communities to that adapted to the more distant returns of the farmer; we might not then have been so ruinously affected by the change, and in Ireland much life, property, and suffering would have been saved; and what is yet more to the weal of the empire, this island would not have been depopulated by an emigration, which, increasing in a geometrical progression, promises to leave us without labourers, and, should a struggle come on, without soldiers to fight our battles. There are no men or women who go to America, but endeavour either by their own means or by the help of those emigrants who have arrived before them, to remit money to Ireland, to bring over their relatives. A servant saves his wages, a small farmer, and even a larger one, furtively disposes of his stock and crop, where not permitted by his landlord, to enable him to find his way to this El Dorado: and well they may; the accounts transmitted of the high wages they receive, and the ready employment they obtain, are so exciting to a people struggling with a precarious existence, that we cannot be surprised at the efforts they make to migrate; and yet they would not leave their native land could they obtain moderate wages and steady employment, for they are willing to labour. It is most general that the sober and industrious emigrants (even such as could or would do no good at home), before he or she has been 12 months in America, pays the passage money of, and sends money home for, the fitting out of some one or more of the family. And this, while marriages and births have much diminished in number. What country can stand this drain?

Although such is our condition, yet we are most certainly recovering from the shock; the demand for land has increased, and farms rarely become untenanted without a competition arising for them, and with scarcely a wall on them, there are now tenants enough found to give the landlord a sum of money in hand to obtain a preference; it has also become common with landlords to ask a year's rent in advance, as a security from the incoming tenant, and these farms are almost totally without dwelling-houses, offices, or gates, the fences in bad repair, the lands water-soaked, and a considerable part of them having borne from two to six crops of Oats in succession. The wretched tenant enters on his land with, in most cases, not more than a pound an acre of capital. I am speaking of farms under 50 acres, the larger ones are not very generally in much better state. The farm I at present hold contains 50 acres of strong clay, badly fenced, undrained, every Grass field full of rushes, every tilled field in Oat stubbles, some having had five crops of Oats taken off in succession for the last six years; the hay and straw have been sold off, and no part of the land manured; the dwelling-house, a small cottage, and offices, of a mean description, were all gutted, doors and windows carried off, and parts of the roofs pulled down, and yet this steading was in the best condition of any untenanted land in this neighbourhood, or on this estate, which was valued, before the depression, at 8000*l*. a year.

Although in England and Scotland there are neither the same deficiency of capital or the same miserable want of farm accommodation, capital is yet wanting to make the only resource—high farming—that has been offered to meet the low prices of to-day and to-morrow available to many; and it is even somewhat questionable whether high farming, with abundant capital, will pay so well as its advocates assert; the high farming of Caird has been much relied on, but the farm of Auchness is evidently an exception, the best paying crop on it, and which swells the amount of its profits, is even too great for Potato consuming Ireland; to the majority of farmers the profits of high farming, if realisable, offer but the cup of Tantalus. It then becomes a question worth mooting, whether a system of cultivation more within the reach of the majority of farmers may not be found; and I think this is to be found in the system long ago promulgated by Tull, or in modifications of it. In this system of perpetual fallow, Nature, in the atmosphere, supplies the dung-heap which high farming raises by high feeding, and the farmer may then, instead of feeding for his dung heap, feed alone on what it may either be profitable to feed, or in such way as he can afford, and to such extent.

Tull contended that his constant fallow enabled him to produce crop after crop without manure; to deficient crops arising from this cause alone, it may be supposed, the system did not survive him, but in availing ourselves of the advantages of a perpetual fallow in fertilising our soil from the atmosphere, we may augment the fertility thus induced by supplying the soil with what fertilising matters our capitals enable us, and we may farm without that abundant capital that this so-called high farming requires; indeed, I think we may in this way obtain more certain, and even higher results than are promised by this high farming, at far less cost. I hope to show, practically, that in Ireland this may be effected with a capital not exceeding 4*l*. an acre, on land in a much more reduced state than is usually met with in England. And we may also, with greater surety, manure heavily by proportioning our distances to the quantity and strength of the manure; in our common tillage of the Potato in lazy beds, we find it is very easy to over-manure them. While in drills we can safely and profitably use larger quantities of manure. Some years ago I planted a few Potato sets, some three or four pounds weight, in very deep drills, full three feet apart, excessively manured, as it was thought, and I turned out from them between 7 and 8 stones. From two rows of Chevalier Barley, sown in very rich ground, 3½ feet apart and 1 foot 9 inches from the contiguous rows, I reaped at the rate of near 7 quarters to the acre, a standing crop, with between 5 and 6 feet length of straw; while in the adjacent rows, at 1 foot 9 inches, the crop averaged under 5 quarters to the acre, with lodged straw only between 4 and 5 feet long.

In ground well tilled and in good heart, not in very high condition, from various experiments through a course of 28 years, I have found about 2 feet, from row to row, the most productive distance for a grain crop; at such distances I have invariably found as many, if not more, stems, and with better heads, than at any lesser distances, while ample space is afforded for working the land between the rows till the blossoming. The farmer has then the option of a successional grain crop, by sowing in the well-prepared and invigorated intervals, or of a green or root crop on ground in fine tilth for small seeds, without requiring the labour which makes these crops so costly. His Turnips at 5*s*. a ton will not then trench on the profits of his grain crops. *J. M. Goodiff, Granard, Jan.* 31*st*, 1850.

## ON BEAN CULTURE.

THE Bean has been propagated into a great number of varieties, both for the use of the garden and the field. But the general character remains, of thriving in a soil that possesses a very considerable degree of tenacity, with a loamy tendency that is sufficient to encourage the speedy and healthy germination of the seed, and the proper development of the roots, which are partly fibrous and tap formed. In Britain the Bean does not thrive beyond the 56th degree of north latitude, and under that parallel it requires the best lands and the warmest situations.

Beans thrive well on all clay lands of the best description, whether the clayey loams admitting of the green crop culture, or the most friable soils. But the favourite soil is a deep loam that is rich and moist, such as is seen near Dunbar, in East Lothian, where the Bean yields the largest crops. The red clay lands of that county which overlie the trap rocks are sufficiently friable to admit some cultivation in the early spring, and the preparation of the land for the Bean is similar with the clayey loams that produce Potatoes and Beetroot. On both soils the Bean follows the Oat crop, the farm-yard dung being spread in broadcast on the stubble, and ploughed under with a good round furrow of 8 or 9 inches. In the first part of the month of February, or so soon as the season will admit, the land is wrought lengthwise and crosswise by Finlayson's harrow, or some similar grubber, and the weeds are carefully picked by hand and removed. The land is then made into drills of 27 inches apart, by one furrow of the common plough. The Beans are sown in the hollows by the double drill Bean sower, and the drills are split and reversed over the seed by one furrow of the common plough, and the land is harrowed across by the light seed harrows before the leaves of the stem appear above the ground. In this way the dung is rotted in the ground during winter, and is intimately mixed with the soil by the workings of the grubber.

Another method lays the farm-yard dung in a trampled heap in a corner of the field before the 1st of February. The land is winter ploughed, and wrought in the spring by the grubber, as before mentioned; then made into drills by one furrow of the common plough. The dung is spread along the hollows in which the Beans are sown by the machine, and the drills are reversed over the dung by the common plough. The drills are levelled by harrowing as before.

The quantity of farm-yard dung used on an acre may be averaged at eight cart-loads of two horses. The quantity of seed at 2 to 3 bushels. The seed time from the middle of February to the end of March. The sowing is not profitably prolonged beyond that time. Opinions differ in the preference of applying the dung on the autumn stubbles, or on the wrought land in the spring. On the very best lands the stubble dunging is preferred, while on the inferior and higher lying grounds the manure in the drills is universally esteemed. The climate may have an influence in show-

ing the different results on the best and inferior lands from the two methods of sowing the crop, the later climate requiring the dung to be more collected and to exert a greater force. The best soils are also more friable, and permit the dung to be minutely mixed with the land by the operations of the grubber. The quantity of land to be sown with Beans on any farm, in the precarious weather of the spring months, often determines the method that is pursued, a large amount of acres requiring the stubble dunging, and a smaller quantity allowing more time for the performance of work.

When the drills are harrowed lengthwise or crosswise, the weeds torn up by the harrows are carefully picked by hand, and removed. When the young plants are all fairly grown above the ground, the intervals of the drills are wrought by a scuffler, provided with tines and knives, which tear and cut the ground in successive operations. A small plough drawn by one horse has been used and rejected, as the sole plate "glazes" the ground by the slipping movement along the earth. This glistening consolidation is most hurtful on all clay lands, and particularly to Beans, which delight in deep cultivation and extensive loosening of the ground. The scarifying of the intervals is deeply done, and about three times in the season, all weeds being removed by hand; and at the end of the season a light furrow is in some cases laid to each side of the row of Beans by a light plough for the purpose. This last operation is not a general rule.

Of all preparations of land, the cultivation of Beans, as now described, constitutes the best precursor for Wheat, which is ever earliest in maturity, and fullest in the ear and pickle, from the tilth which has been left by the Bean. This fact has been tried to be accounted for by the theory of fecal exudation, which supposes that the excrementitious voidances of any plant of one class are food or aliment to another plant of a different class, as are Beans and Wheat. Be this as it may, the fact was known as certain before the theory was dreamed of. A close crop of Beans shades the ground by a thick umbrage of leaves, which retains moisture, prevents exsiccation, and commences a decomposition on the surface of the earth, in the terrestrial elements that there exist. The main or tap root of the plant penetrates and divides the ground, and all fleshy roots exude a juice that blackens the earth in contact, and has a very fertilising effect. These natural reasons may be able to account for the benefits which the land receives from a crop of Beans, without having recourse to the doubtful theory of fecal ejectments.

The above method of cultivating Beans applies to lands of sufficient loaminess to admit cultivation in the spring, and enjoying a climate of earliness to favour the operations. The clay lands that can be used in that way are comparatively of small extent, and on the greater amount a very different process becomes necessary. The plastic clays that overlie the chalk hills of Surrey, and the clay of the London basin, are both of them formations possessing an adhesive stubbornness that almost defies cultivation. On these lands no spring cultivation can be attempted. The ploughing of the land at any season of the year requires the strength of four stout horses, and should only be wrought in the driest season. Beans are generally, and almost of necessity, sown in broadcast, and occupy the place of a corn crop in the rotation, as the land is not subjected to any working, and does not produce a fallow crop of any kind. During the earliest growth of the Beans the weeds are checked by one or two hand-hoeings, as the plants are thinly planted, and cover little ground. But as the plants rise to height, the weeds grow in the vacant places, and broadcast Beans are most generally a specimen of very foul farming. Wheat cannot be sown till the land undergoes the bare summer fallowing process; consequently Beans are not an eligible crop.

On some few soils of the more loamy descriptions of these clay lands, where the deposit joins the iron sands, the spring cultivation is practicable, and the treatment of the Beans falls under the foregoing statement. A rather stiffer sort, but which does not fall under the most tenacious kinds, admits the Beans to be sown by dibbling on the alternate furrow slices of the winter ploughing, after the surface has been very severely harrowed by heavy implements, and the utmost possible tilth raised from the pulverisation of the winter's exposure. This method admits the horse and hand-hoeing, though the former operation is done more lightly than when the land is stirred by the grubber, and consequently the cultivation is much less complete. Sometimes the rows of Beans are placed on each furrow slice, and then the hand-hoe only is admitted. The wide drilling cultivation prepares the land for Wheat, more or less effectually, as the soil is friable, or obdurate. But on the most obdurate and plastic of these clay lands the drilling on the surface of the winter ploughing is wholly impracticable, as well as moving the ground by any implement. The operation of harrowing will not produce any quantity of tilth on these waxy soils, and the trampling of the dibbling operation will do much damage by consolidation; consequently a broadcast crop is indispensable, and generally makes very foul farming. Beyond it, modern improvements have not yet gone in cultivating Beans on these most unruly soils.

The lias clay which forms the base of the oolitic deposits, the "clunch" clay which occupies the moist valleys of the middle oolites, and the kimmeridge clay, which is overlooked by the higher rocks of the upper oolites, fall under the same treatment in the cultivation of Beans as the clays above described. The stiffest kinds are sown broadcast; while the greater part admit the dibble on the harrowed surface, or the sowing in rows by the coulters of the machine, or in drills made by the one-horse plough. The loamy modifications of these clays admit a pretty deep cultivation of the intervals, and consequently a very fair preparation of the land for Wheat, which, as a grain crop, should always follow the Bean cultivation, whenever the land can be manured, and wrought in some tolerable degree.

The gault clay, as seen near Godstone in Surrey, is very stiff and adhesive, and prevents any spring stirring of the land, and also, in many cases, the drilling on the harrowed surface of the winter ploughing; consequently, the cropping in broadcast is used, with a check of the weeds by an early hoeing, which does not form a preparation for Wheat but for a crop of Oats that is followed by fallowing. On the modifications of the gault in the Tetsworth clay of Oxfordshire, and in the deep valleys of Huntingdon, where the debris of the chalk forms a mixed ingredient; the first-mentioned culture of Beans is practised on the more friable description of land, while the drilling or dibbling on the spring harrowed surface is the more general method on the greater part of the soils of that description. Broadcast sowing is not necessary on these modifications of the gault clay.

In the county of Essex, where Beans are produced in great perfection, the clay lands are formed of a mixture of the plastic and London clays, with occasional appearances of the clunch or fen formation of that body. Dry, gravelly, clay grounds are found on the undulations of the surface, which rise in loaminess and reach to Turnip soils, while the stiff lands yield good crops of Beans. The alluvial lands are very extensive along the estuary of the Thames, and the soil is very suitable for Beans. These soils and the gravelly clays admit the spring cultivation for Beans by the grubber, and the manure to be applied on the autumn stubble, or in drills in the spring. The true clay lands of Essex are planted with Beans by the dibble on the alternate slices of the furrows of the winter ploughing, as before mentioned, and the farm-yard dung laid on the stubble and ploughed under by a deep furrow. The intervals of the drills are cultivated during summer as deeply as possible by the grubber, the weeds are carefully cut by hand-hoe, and the land is thus well prepared for Wheat, which is sown in broadcast on the furrow of one ploughing, or drilled in rows by machine on the harrowed surface of the gathered ridges.

The Wealden formation of clay is so aluminous as to forbid any spring movement of the land, and in many cases also the drilling or dibbling on the harrowed surface of the ground. In the county of Kent, modifications of that clay are found overlying the lower ledges of the limestones and sandstones of the tertiary formation, and on these soils Beans are cultivated as on the best lands that have been mentioned. But on the lower deposits of the Wealden formation, where no extraneous bodies are adjacent to mix the composition, the clammy adhesiveness and stiffness of the soil compels the broadcast cultivation of Beans in which the crop is small in the return, and confers little benefit on the land. In that way it neither defers the fallowing process, nor renders it easier of accomplishment.

Over much of the extent of England, and largely in Durham and Northumberland over the coal deposits, soils are formed of thin arid clay, on which Beans can only be cultivated in broadcast, and are little used, on account of the foul state of the land which follows the crop. The quality of the soil is much below the power of the Bean plant, and the insertion of it in the rotation of cropping is very judiciously rejected. In these counties, the soil and the climate are both adverse, the quality of the one not correcting the deficiency of the other, for the growth of Beans.

Beans are sometimes grown on Grass layers, when the seed is best deposited by dibbling, on the well harrowed surface of one ploughing. The drills may be wide, on alternate slices, for the grubber, or narrow on single slices for the hand-hoe; and if the firm state of the land does prevent the deep working of the grubber, the weeds will be completely checked by the hand-hoe, either in wide or narrow drills, and assisted by the shallow operation of the drill cultivator.

The shrivelling leaves of the haulm, and the black colour of the pod or legume, with the hardened state of seeds, give notice of the maturity of the Bean plant. The crop is most generally cut by the sickle, tied into sheaves, and built into ricks, thatched with straw, or lodged in barns. The straw and the grain are very easily separated, by flail or by machine, and winnowed for use. The sheaves are tied by straw ropes, or tarred twine, which will last for many seasons, on being kept from year to year. The straw of Beans, when well harvested, is very particularly relished by horses, and the husks of the legumes by sheep, and it forms, in any shape, very useful litter for swine in sties, and for sheep confined in cots. In a good state, it is reckoned equal to the best hay, of any kind or quality.

The chief use of Beans in this country is, to feed horses, for which purpose they are very usefully mixed with Oats, as they contain a large proportion of nitrogenous ingredients, and therefore feed the muscular parts of animals. They are also used in feeding swine, bruised and unbruised; they make the flesh very firm. Bean-meal is used in fattening oxen; mixed with water, and given to cows, it greatly increases both the quantity and quality of the milk. Some Beans are also mixed with new Wheats in grinding, and millers generally contrive to use a due proportion, pretending that the new clammy Wheats will not grind without some such mixture.

On the best Bean lands, which admit the drilling and manuring in the highest perfection, the average produce of Beans per acre may be stated at 4½ qrs., and on the remaining inferior soils at 2½ qrs., making the general average 3½ qrs., which may be fully equal to the truth.

The proportion of nutritive matter in Beans, compared with other grains, is thus given by Einhof:—

| | By weight; or, | by bushel. |
|---|---|---|
| Wheat | 74 per cent. | 47 lbs. |
| Rye | 70 ,, | 39 ,, |
| Barley | 65 ,, | 33 ,, |
| Oats | 58 ,, | 23 ,, |
| Beans | 68 ,, | 45 ,, |
| Peas | 75 ,, | 49 ,, |
| French Beans | 84 ,, | 54 ,, |

The ashes of Beans contain—

| | |
|---|---|
| Phosphate of potash and soda | 63 59 |
| ,, of lime | 9 35 |
| ,, of magnesia | 19.11 |
| Sulphate of potash and common salt | 1.84 |
| Silicate of potash | 1.11 |
| | 100.00 |

The ashes of Bean straw contain—

| | |
|---|---|
| Carbonate of potash | 3.32 |
| ,, of soda | 6 06 |
| Sulphate of potash | 32 04 |
| Common salt | 0 28 |
| Carbonate of lime | 39.50 |
| Magnesia | 1 92 |
| Phosphate of lime | 6 43 |
| ,, of magnesia | 6 66 |
| ,, of iron and alum | 3 49 |
| Silica | 7 97 |

Beans contain in 10,000 parts about 200 parts of potash. *J. D.*

## Home Correspondence.

*Brewing.*—I gladly comply with the request of "A. B." as far as I can, and I do so the more willingly because in reading over the article to which he refers I detect a mistake, not in the receipt itself (for the temperatures are given correctly as far as precept goes), but in the phenomena of the process, viz., the temperature which the mash tun will attain at the commencement of the first mash, if the directions which I then gave are followed. I stated the addition of the second quantities of water at 182° would bring the temperature of the mash up to 165° to 167°. Those figures ought to have been 155° or 157°., which is the temperature which results from the preceding quantities and heats. I find from my notes that this temperature varies from 155° to 157° in cold weather in March, and from 157° to 159° in summer or autumn. The temperature of the second mash is correctly stated, and ranges from 168° to 172°. I do not know that much practical error would occur from this mistake, as any one who followed my directions in other respects would discover that it was a mistake, but I am glad to have the opportunity of correcting it. Thus much premised, I proceed to "A. B.'s" queries. I have no experience of German yeast, and should be afraid to use it, except it were in a small brewing of strong beer, for the purpose of procuring beer yeast for a further process. Rain water I consider best for brewing, and I use none other; but I should hesitate to use it if sooty or otherwise offensive. It will throw off much filth by boiling, and afterwards by fermentation; but if really foul it could not fail to affect the flavour of the beer. That which I use is preserved in a large tank, and is tolerably pure, containing only a little lime, which is derived from the Roman cement. To "A. B.'s" last query I can give no very satisfactory answer. If he possessed a knowledge of chemistry, he would hardly ask such a question; and without such knowledge, he will hardly understand any answer I can give. He probably knows that the same Potato will be waxy, mealy, ropy, and paste-like, according as it is boiled for a longer or a shorter time; somewhat analogous to this fact is the process which produces sugar or gum from the same materials. If "A. B." has some knowledge of chemistry, he will find some of the information he seeks in p. 943 of the seventh edition of "Turner's Elements of Chemistry," by Liebig and Gregory, 1842; and he will collect more by consulting different Cyclopædias on the subjects of Diastase, Gum, Sugar, &c.; but I cannot now exactly recollect or refer to the various sources from which I have picked up the little information which I possess on this subject. Suffice it to say, that as far as it has been investigated, between 158° and 148° appears to be the temperature at which Grape-sugar is formed most freely; and it is not destroyed below 170° or 172°. The best temperatures, therefore, would seem 158° for the first mash, and 168° for the second. Another year's experience has confirmed the excellence of the receipt which I ventured to give in March last; and by the addition of a false bottom to my mash-tun, and the accurate fitting of its wooden cover; my mash seldom loses more than 3° per hour, that is to say, that commencing at 158°, it does not fall to 148° in less than 3¼ hours; so that I can maintain the mash fully 3 hours, between the limits which Payen and Persoz state to be most favourable to saccharification. In conclusion, I will remind "A. B." of Virgil's lines:

"Felix qui potuit rerum cognoscere causas,
Fortunatus at ille Deos qui novit agrestes,
Panaque Sylvanumque senem."

If we cannot attain to the first and highest rank of knowledge, we must be contented and thankful in the second. I wish I could answer his inquiry into the rationale of the process, by which I am converted into a palatable and refreshing beverage; as I cannot, I

resign myself to the tender mercies of Ceres, or which other soever of the rural deities presides over the destinies of a *Barleycorn*.

*Management of Sheep in East Kent.*—Seeing a short account "On the Farming of Sheep," in your *Agricultural Gazette* (of which I am a subscriber) of the 25th ult., I beg to send you "the plan adopted, generally, in the Isle of Thanet, and in many parts of East Kent."—First: We buy the lambs at Romney or Hamstreet fairs, by a salesman or ourselves, or of upland breeders known to us, in the latter part of August or first part of September. Fold them a few days after the journey, on a Saintfoin rowen, (which most of us have), then let them run over the grattens, [Pray tell us what "grattens" and "rowens" are?] attended by a boy, for which he is paid 4*s.* per week. At night they lie in fold on the before-mentioned Saintfoin, changing the fold once a week. As soon the food gets scanty, they are then put on the Cole (after Peas), or white Turnips, changing them every two or three days (lambs are best on a variety), giving them at the same time Pea or Bean straw, and at times Clover hay (second heads). We do not mind wasting a fold or two at first, till they get into the way of eating Turnips as a boy picks them up, and they are carted into the yard for the hogs. In the spring about the beginning of April, they are sent down to the marshes, (Barton Valley, Minster, &c., &c), there remain till October, when they come to the upland again, and are put on Swede Turnips, first having cut Clover hay (second head), with 1½ gallon common salt sprinkled in it; the above quantity is sufficient for a cart-load (to the floats). After a fortnight they are draughted off, the best, about 50 or 60, according to the size of the flock, and feed a little higher than the rest; the refuse having ½ pint of Peas or Oats a day each, the best ¾ to 1 pint each, and one bushel of ground oilcakes to two score. We sell these all out by the time the Turnips are gone (April), and the lambs bought this year are sent to marsh, and return the following autumn to be fattened. When very wet weather during the time of fattening, we litter a corner of the field with straw; those that have pasture land put them upon it for the time. *A Young Agriculturist.*

*On the Culture of the Mangold Wurzel.*—The Mangold Wurzel is probably one of the most useful vegetables ever introduced into the country, particularly the Yellow Globe, and long rooted yellow kinds; and there can be little doubt that, as it becomes better known, it will be more generally cultivated. One great reason that continues to operate against it is, the difficulty, not only of obtaining a crop, but of getting the seed to vegetate. If the following instructions be attended to (the result of three years' practical observation) no one need fear to realise a crop, which, of all others, is the most valuable for feeding stock—namely, beasts, sheep and pigs. *Rules for preparing the Ground for the Seed*:—Let the ground be well ploughed or dug to a good depth in autumn. About the first week in April, let the land be thrown into ridges, as for planting Potatoes; manure it well with good yard manure, say, from 10 to 12 tons per acre. Before covering the manure, sow two hundredweight of the best Peruvian guano broadcast over the whole; then let the ridges be closed, and rolled down with a light roller, just enough to level and press their surface; after which, let the holes be made with a dibble two inches deep, and 12 inches from each other, to receive the seed, which should be prepared as follows: *Preparing the Seed for Sowing*:—For an acre of land, take four pounds of good seed, of the true Yellow Globe, or the New Long Yellow; but this must depend upon the quality of the land. If it be of a light moor or bog kind, I should recommend the Long Yellow; but if otherwise, the Yellow Globe. A few days before the land is ready, place the seed in a pail, then add as much water as will cover it; to which add six ounces of the best Peruvian guano, and stir well together. In this state, let it remain 36 hours, stirring it up well twice a day. After which, take a wet cloth, lay it on a warm place, and spread the seed upon it, to the thickness of about two inches; cover it down with another wet cloth, taking care to keep both cloths damp. Stir up the seed once a day, until it begins to sprout, which it will do in four or five days, if kept warm. You may then commence dibbling the seeds, say, one or two in a hole; after this just close the whole down with the head of a garden rake. When the plants are up two inches high, should any of the seed have missed, draw out from those places where there may be two together, and fill up the vacancies, taking care to leave the best plant undisturbed. Nothing more need be done but to keep the ground clear of weeds, until September, when you may commence gathering the under leaves for your stock, say, about one-third at a time, which may be done once in a month, until the latter end of November, when you may prepare for taking up the roots. *Storing the Roots*:—Much care is requisite in taking up the roots, so as not to cut or wound them with an instrument; but twist off the leaves by hand, and take care to choose a dry day for the purpose. When taken up, they should be led into a ridge, as you would Potatoes, and cover down with a good thickness of straw, and a final covering of about four inches of earth. It is of the utmost importance that all evaporation should pass away; and this may be easily effected by chimneys being placed at distances of three feet apart, and formed of the common drain tile. In this state, they may be kept in perfect preservation until April or May, if required, and will be found really valuable for milch cows during the winter months, for sheep in lambing time, and for feeding pigs in autumn; but in the latter case, I should recommend a small quantity of Peas or Beans to be given with them. *W. Stent, Nursery and Seedsman, Stockwith, Gainsborough.*

*Slipping Calves and Foals.*—Having been entirely free from such occurrences on my farm, I was induced to consider the cause of this exemption, and believe I have arrived at a sound conclusion; but throw out a few remarks, to elicit from your various correspondents some evidence on this important subject. I believe foul water to be a principal cause of these mishaps, having observed that where pure water is given there is an almost total exemption, whilst the most numerous cases occur (particularly in Herefordshire) where the animals drink at ponds receiving the drainage of the farm-yard. That which is but slightly injurious to the mother, evidently destroys the fœtus. I am not sure that foul air and want of ventilation have not an evil tendency. 'Tis quite certain, I have experienced, that young calves have been destroyed in a night, by a vitiated atmosphere that has not apparently injured the more robust parents. So particular are cattle and sheep about water, that having tarred the joints of a slate cistern, the animals refused the food saturated by the water from this cistern. Although some farmers consider foul ponds non-injurious, I know a case where a mare, unused to such liquid, was nearly destroyed by it. *J. J. Mechi, Feb.* 20, 1851.—[You are probably aware of the pernicious effects of ergot—a disease to which the Grasses are more generally liable than was once supposed.]

## Review.

*What ought Landlords and Farmers to do?* By Ph. Pusey, M.P. for Berkshire. John Murray, Albemarle-street.

The editorship of the "English Agricultural Journal," is not the least of the services which Mr. Pusey has done to English agriculture. The task of preparing the index of its first eight volumes having been confided to us, no one is better able than ourselves to testify of the rich mine of agricultural wealth which those volumes contain. The collection of the valuable papers which make up the contents of the work, has been conducted by intelligence enough to secure to its readers the earliest trustworthy novelties in the agricultural world, and by judgment enough to save them from most of the extravagances with which it abounds. A sound view of the connection between the sciences on which agriculture rests, and the practices of which it consists, has always conducted Mr. Pusey through the duties of his post, so that he has been a safe guide for the large body of readers whom he has influenced; and his journal has, undoubtedly, been the leading agricultural periodical throughout the 10 years of its existence.

The pamphlet named above is the "leading article" of the current volume of this journal. It attempts to concentrate the light of all the past volumes upon the present position of agriculturists. And a very instructive and satisfactory light it gives. The present position of chemistry and meteorology, in relation to agriculture, is described, the present state of agricultural mechanism is pointed out, the means which the landowner possesses of improving the soil are referred to; and the details of farming, under the heads of "Management of Manure," "Foulness of Land," "Winter Cropping," with reference to some of the cultivated plants, are discussed.

The first and second sections of the review are very interesting and useful in guiding to a correct estimate of theory; but it is in the latter and more practical portion of his performance that Mr. Pusey's statements will be most useful. The improvement of the soil, including draining, removal of fences, diminution of four-footed game, the use of burnt clay, marling or claying, liming, boning pastures, chalking, irrigation, breaking up of Grass lands, improvement of buildings and warping, is discussed, of course very generally, when you consider that the whole of this part of the pamphlet occupies only 12 pages, but still usefully as an index to point the attention of agriculturists in the proper directions. On some of the points which are discussed, our own experience is very different from Mr. Pusey's—as for instance on the cost of digging drains, where he finds it possible to dig a 5 feet deep drain for 4½*d.* per perch! and on the amount of capital required in farming, where the sum of 6*l.* per acre, he states, is ample allowance, "with sheep-farming at least," for the highest possible farming; but it is the very leading point in his views of agriculture, and indeed in every sensible view of the subject, that all sorts of experiences are possible, and may each of them be justifiable and compatible with skill and good practice in different parts of this country, which is unmatched by any other in the world for its variations in soil and climate. Mr. Pusey's name is sufficient surety for the wide circulation of this pamphlet among the agricultural readers of England; but we willingly add whatever influence a recommendation of it in these columns may possess in the eyes of our subscribers.

## Miscellaneous.

*Hints on Laying Down Land to Permanent Pasture.*—It is highly important that the land should be cleaned from weeds, and well pulverised by repeated ploughing and harrowing before the seed is sown; and in cases where the soil is particularly loose or sandy it is desirable that it should be also rolled before sowing; if this is not effected, the seeds (many of which are very minute), will some of them be too deeply imbedded in the soil, while others may not be covered at all. It is also desirable that the seeds should be sown when there is not much wind, and that they should be delivered from the machine or the hand, placed rather near to the soil, otherwise the smallest and most valuable of the seeds may be carried by the wind into the adjoining field or hedgerow. The harrows, which should be very light, must be again drawn over after sowing, and, if the soil is very light and dry, the roller also; if the soil is poor, a dressing of Peruvian guano or superphosphate may be harrowed in with the seeds, at the rate of 2 cwt. per acre. The sorts of seeds should, of course, be selected in accordance with the nature of the soil, and the purposes to which the pasture is intended. This and much other useful information may be obtained from "Lowe's Elements of Agriculture," "Stephens' Book of the Farm," "Sinclair's Hortus Graminiensis," and other works; or from seedsmen and agriculturists who have paid especial attention to this part of botany and agriculture. If corn is sown with the Grass seeds, it should not be more than 1 or 1½ bushels to the acre of corn, and for this purpose Oats are preferable to Barley. *On Improving Old Pastures.*—Having as far as possible eradicated the strong growing weeds and coarse Grasses, and improved the condition of the land according to its requirements if any, heavy harrows should be drawn over the old turf early in the spring, to loosen the soil for the admission of seeds of the finest and most nutritive kinds of perennial natural Grasses and Clovers, which, if sown freely, will occupy the numerous small interstices between the plants of Grasses already growing, and thereby prevent the luxuriant growth of coarse Grasses and noxious weeds. It is a good practice to sow these seeds at the same time as the top-dressing is applied, but this is by no means necessary. *From Messrs. Sutton's "Catalogue of Natural Grass Seed," just published.*

### METEOROLOGICAL REPORT.—February.

(*Continued from page* 125.)

[By an accidental oversight, the note at the foot of our last week's report was misplaced; it should have been inserted after the storm marked ‡‡, and have had the date February 10, attached to it.—Ed.]

| Date. | Time. | Max. | Min. | Wind, and Remarks. |
|---|---|---|---|---|
| Tues. 18 | 5 p.m. | 29.97 | ... | SW. Overcast, with a stiff breeze. |
| 19 | 7.15 a.m. | 29.89 | ... | SW. Steady breeze, and overcast the whole day. |
| | midnight. | ... | 29.77 | |
| 20 | 7.20 a.m | 29.70 | ... | SW. Almost calm; dull |
| * | 2.45 p.m. | ... | 29.65 | cloudy day, with alternating dark clouds and sunshine, but not cold. |
| 21 | 2 a.m. | ... | 29.68 | N. all day. Calm, occasional |
| | 10.40 p.m. | 29.80 | ... | gentle breezes, and overcast; but a very pleasant day. |
| 22 | 10.5 a.m. | 29.81 | ... | ESE. Moderate breeze, fine, and sunny. |
| | 4.40 p.m. | 29.79 | ... | SE. Stiff breeze all day (in- |
| | 8.30 p.m. | ... | 29.76 | creasing towards night), and fine. |
| Sun. 23 | 7.45 a.m. | 29.70 | ... | ENE. a.m., gentle. White |
| | 6 p.m. | ... | 29.65 | frost; fine; Noon, E. Stiff breeze, dark clouds; p.m. E. less wind; overcast. |
| 24 | 7.40 a.m. | 29.62 | ... | ENE. to ESE. with gentle |
| † | 11.40 p.m. | ... | 29.61 | breezes, and fine sunny day; barometer steady. |
| 25 | 7 a.m. | ... | 29.61 | NNE. to ENE. a.m. Brisk |
| | 11.25 p.m. | 29.83 | ... | breezes. E. noon, and p.m. Although it rained the whole day, more or less, the barometer rose steadily, and towards night the wind drew round towards N., and went down to calm. |
| 26 | 7 a.m. | ... | 30.04 | NNE. all day; brisk. Bright |
| | 11 p.m. | 30.25 | ... | day and fine, but *very cold*, with dry clouds (as of snow) floating by; Even. N. Clear bright night and hard frost. |
| 27 | 7.15 a.m. | 30.26 | ... | N. and NNW. Gentle breeze; white frost, clear and fine. |

* On the afternoon of Tuesday, the 18th, whilst watching the last storm moving away slowly to the Eastward and Northward from the Island of Portland, I observed a heavy bank of clouds collecting in the South West, and on my return home the barometer had begun to fall. This storm travelled across England from SW. to East.

† It is with a certain degree of hesitation that I offer this explanation of the weather from February 22, to this moment of writing; partly because no storm which I have yet noticed has taken this route, and partly because I venture to infer from it the future; and hitherto I have only offered explanation of that which has already occurred, but whereas all the storms I have hitherto observed either travel from West to East, or from South to North, having the Continent to the right of their central track; this storm is travelling from South to North over the Continent of Europe, having come from the Westward over Spain, and passed up the Gulf of Lyons, over Germany, and up the Baltic. Until the barometer falls, from the approach of another storm, continued frost may be expected.

Dorchester, Feb. 27th. *F. P. B. M.*

(*To be continued.*)

## Calendar of Operations.

### FEBRUARY.

"An Essex Farm, *Feb.* 18.—The fine weather last week has set every one to getting in their spring corn, Peas, Beans, &c.; and we have nearly finished dibbing Beans, not growing more than half the quantity of spring-sown since we have tried the winter sort, finding them a more average crop one year with another, though they do not yield near so many in a good season as the Long-pods, the only other kind grown here; the Long-pods are dibbled with a common dib, the land being previously marked out with the drill. This gives the Beans an additional 2 inches in depth, the distance being about a foot each way, thus giving you a good chance to hoe them well. They require going over three times at least (a man dibbing from one-half to three-quarters of an acre a day), and are then covered with light harrows. The Barley is all drilled on this farm 4½ inches. We have tried it at a greater distance, but found it did not yield so well, nor was it of so fine a sample; this led to a return to the old way. The only kind grown is the Chevalier; it is liked most

by the maltsters, and yields well. We shall finish drilling Barley next week, if fine weather, then begin sowing Oats, having a large breadth this year from breaking up a quantity of old pasture; and the Oat crop is generally very good on this kind of land when burnt. We grow the white Tartarian; it is a sort that yields well, and improves so much on this land that you would hardly know it was the same kind, with the seed; we always have it from the Fens, where it is a long thick-skinned Oat, nearly all husk. The ewes have nearly all dropped their lambs, and we have been tolerably fortunate, having only lost two ewes out of a flock of 200; and there are more twins than generally—quite one-third of them. The ewes now have Mangold Wurzel and half Swede Turnips, with as much chaff (half Clover hay and half straw) as they will eat. The Turnips and Mangold Wurzel are given on the pasture, which is much barer than it was a month ago. The ewes are put into the yard every night, a man being engaged to get up once or twice during that time to attend upon those lambing. We have had a lot of two-year old wethers fatted in a barn this winter, which we have sold; and the plan has given much satisfaction, for they gained much more fat than when on the land, and appeared to enjoy the shelter given them greatly. We put down about 9 inches of burnt earth on the floor before putting them in, and a sprinkling of straw over it; this, with the addition of a barrowful or two spread morning and evening with the other straw, has kept them very clean, and has made a large quantity of excellent manure, fit to drill in with anything. *E X., near Braintree, Essex.*—[Please send us the rest of your poultry article.]

Lammermuir Sheep Farm.—Another month has passed away—so mildly, too, that one can hardly persuade oneself that winter is now about half over, if, indeed, it is to be restricted to a definite number of months and weeks. True, we have very variable weather, and much rain—though we hear there has been a very moderate fall in the lowland districts—so much so, that some stock-masters, whose grazings are naturally wet, are longing for frost, being afraid of rot. Fortunately, there has been no appearance of this scourge as yet, though it may show itself in some few cases in spring. In the meantime our flocks are unusually healthy; indeed, we do not remember seeing them more so at this particular season. Still we believe that a moderate frost, and slight covering of snow, to preserve vegetation, would be useful. "Everything is beautiful in its season." And as our sheep cannot expect to live their usual time, without encountering some hard winters, the sooner they are inured to them the better. As mentioned in our last, the rams were removed from the ewes at the new year. We have taken Turnips elsewhere, for such as we do not intend using again, to be sold as soon as fat. The rest are receiving as many at home as will suffice to keep them in good health and spirits. As a general rule, we are averse to using rams above two or three seasons; being satisfied that the produce of young sheep are most vigorous. Still, when about 50 rams are required on the farm every year, it is no easy matter to procure such a number of really good shearlings, especially of Cheviots and Blackfaces, which are difficult to obtain at all, and not except at a high figure, being actually higher priced than average Leicesters of the same age. It may be accounted for in this way: From a given number of lambs retained, there is always a much smaller proportion of *good* sheep from the two former than from the latter breed, most probably because, unfortunately, until of comparatively late years, the same attention has not been bestowed upon the breeding of mountain sheep, and also because there are seldom the same facilities, in the shape of enclosures, for making a careful selection of ewes to be put to the first-class rams, which are to be found on all lowland farms. Consequently, though the best male lambs from the best ewes have been retained, still, from the latter never having been separated from the rest of the flock, the sire may not have been suitable in every respect. The necessity for a frequent change of rams will also be apparent, when we remember that hardiness is a *sine qua non* in mountain sheep; and hence, though a breeder may have first-rate stock himself, all in and in breeding must be avoided as much as possible. The late open weather has certainly forwarded ploughing operations greatly. We have finished the lea for Oats, and have begun to ridge up for Oats after Turnips. The latter we purpose stirring with Scouler's two-horse grubber when sown. Oats twice in a four-course rotation may seem hard work, but having repeatedly tried Barley, we find the elevation too high (700 feet) for this crop. Besides, most of the straw being consumed by the cattle and horses, that of the latter grain makes very poor fodder. The carting out of manure for Turnips progresses very slowly. The greater part of the field for which it is intended being very steep, renders it next to impossible to cart up heavy stuff, except during frost. Still, as the work at sowing time is better and more expeditiously got through when the manure is to carry over the hill at that time, we will wait yet a little longer for frost. Besides straw, all the cattle are now getting a moderate allowance of Turnips. We have a few calves, which receive about seven quarts of new milk daily, with Swedes and Clover hay *ad libitum*. *A Lammermuir Farmer.*

## Notices to Correspondents.

Beer: *S Dynes.* Will any correspondent state if he has found any prejudicial effect to be produced either on the article or its consumer by cooling or working beer in vessels lined with zinc. [We should not expect any harm.]

Beans: *C C.* They need not be boiled at all. Soak them in cold water long enough.

Drainage Acts: *A Poor Landlord.* It will be quite competent for you to back out of the whole affair, at any time, on paying the expenses incurred. The business of the inspectors is not so much to lay down plans of drainage, as to see that those selected by applicants are economical and efficient. Inspectors but too often find that neither landlord nor tenant know anything of draining, and then, of course, they have to explain the plans which they conceive best under the circumstances. The inspectors are generally men of the greatest practical experience, and we firmly believe, that so far from your having occasion to grumble at their proceedings, as you appear to anticipate, you will, upon trial, derive the greatest benefit from their advice.

Eggs: *E A R.* An Irish correspondent suggests that the best way of preserving eggs is to have pullets hatched in February that will begin laying in December. Fuller information will be found in the chapter on eggs in Dixon's "Ornamental Poultry."

Fences: *J C.* Quicks should be cut at the time of planting and put into the ground, leaving an inch or two only above the surface. On inspection you will perceive by the colour how far up the stem the soil has covered it whilst growing in the nursery-bed. The tops of the Quicks should all be cut off about two inches above this point, previously to being inserted in the soil. See Morton's "Cyclopedia of Agriculture," article "Fences," for the mode of raising and planting Quick. *B.*

Flax: *X Y.* See report of M. Claussen's statement before the English Agricultural Society.

Grasses: *Street.* Will any one tell us what mixture of Grasses is generally sown for permanent pasture on the fen soil of Lincolnshire.—*An Old Subscriber.* You should state the soil. If it be a light, gravelly, Barley soil, the following is a list of seeds:—Alopecurus pratensis, 1 lb.; Avena flavescens, 1; Dactylis glomerata, 2; Festuca duriuscula, 2; F. heterophylla, 1; F. rubra, 2; Lolium italicum, 3; L. perenne, 5; Poa nemoralis, 2; P. pratensis, 1; Medicago lupulina, 1; Trifolium pratensis perenne, 3; T. repens, 4 lbs.; in all 28 lbs. per acre.

Harrows: *T L.* The teeth of iron harrows need not be screwed in; they may be wedged in, as they are in wooden frames, and may be just as easily removable. If they wear more that proves their greater efficiency. In every respect we should prefer the iron implement.

Lazy-bed Planting: *W Keith.* The system is to dig the land; planting the Potatoes on the surface in narrow beds, and covering them with the earth taken out in forming alleys between the beds. The advantages are the furrow drainage and the depth of good soil. See Richardson's shilling book on the pig.

Oil-cake: *Oxford.* It will take nearly 50 bushels of Linseed, weighing 60 lbs. a bushel, to make a ton of oil-cake.

Paint: *M B* says, "I have been making a large outlay in farm buildings, and they are just come to a conclusion; I am at a loss what paint or other material to make use of for all the wood work—doors, windows, shutters, &c., for outside work, and in a county where as much rain falls as any part of the United Kingdom. I wish for the most durable, at the same time with a due regard to economy. Can any of your correspondents with their experience in these matters assist me?"

Poison: *Anon.* In Australia and New Zealand the wild dogs commit great ravages upon the sheep; if with the poison (strychnine), which the settlers place for their dogs in the sheep walks, there were anything which would attract them to it, it would be a great benefit. Can any of our correspondents say what dog stealers and others are supposed to use to attract dogs to them?

Poultry: *A H.* We know of no other way of preventing fowls from eating eggs, except to supply them liberally with crushed egg-shells, calcined oyster shells, &c., besides a sufficiency of insect or animal food. Hens, that are set on too many eggs, will often eat as many as they think above the due number, and carefully hatch the rest.—*C E C.* The black spots on the combs of the Dorking fowls *may* be frost-bites and chilblains only, or they *may* be symptoms of severe organic disease within. In the first case, good keep and comfortable housing will check the complaint, in the latter, the patients are in a bad way. What a pity it is that ladies and gentlemen who send us inquiries do not indicate whether the answer is to apply to Caithness or to Cornwall.—*A F.* Your bantams are evidently all out of health from being "brought up in a small inclosure under a net," or they would not all have the same difficulty in laying eggs, which, when laid, prove defective. Send them out for a week or two to a country walk. Beware of giving them salt, or you will soon poison them.

Tullian System: *G T W.* By trenching half the ground in the way described, the surface of the fallowed space is getting the benefit of aeration and the mechanical action of frost, at the same time that it is affording space underneath for the roots of the Wheat to extend into, and draw nutriment from, and in this way it is being prepared for the next year's planting. I believe it will be an improvement on the practice, to begin with trenching all the land, and to sow the Wheat 21 inches apart, and to trench the intervals, and this I am going to try; but this is neither the plan of Jethro Tull nor of Mr. Smith. I am sowing all my Oats and Barley and spring Tares at these intervals, to be able to cultivate between them, such is my confidence of the value of moving the soil between the young corn. I advise every one disposed to try the effect to begin with reading Jethro Tull, and a visit to Mr. Smith. *Hewitt Davis.*

Youatt on the Horse. We have the two editions, and should greatly prefer the 10*s.* copy.

# Markets.

COVENT GARDEN, March 1.

Hothouse Grapes are now over for a season. Pine-apples are still dear, and the supply of good dessert Pears is limited. English Apples are scarce. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. Vegetables of all kinds are abundant and good. The trade for French Beans and Cucumbers is improving. Carrots and Turnips are good in quality, and so are Potatoes. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1*s.* 6*d.* per pottle. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Tulips, Double Primroses, Cinerarias, Moss and Provins Roses, and the different kinds of spring bulbs.

### FRUIT.

Pine-apples, per lb., 6*s* to 8*s*
Grapes, Portugal, p. lb., 8*d* to 1*s*
Pears, per doz., 2*s* to 5*s*
— per half sieve, 6*s* to 15*s*
Apples, dessert, per bushel, 6*s* to 10*s*
— kitchen do., 5*s* to 8*s*
Lemons, per doz., 1*s* to 2*s*
Almonds, per peck, 6*s*
— sweet, per lb., 2*s* to 3*s*
Oranges, per doz., 9*d* to 2*s*
— per 100, 6*s* to 10*s*
— Seville, p. 100, 7*s* to 14*s*
— — p. doz., 1*s* to 2*s* 6*d*
Chestnuts, per peck, 2*s* to 5*s*
— per 100, 9*d* to 1*s* 6*d*
Nuts, Barcelona, per bush, 20 to 22*s*
— Brazil, p. bsh., 12*s* to 14*s*
Cobs, per 100 lbs., 70*s* to 75*s*

### VEGETABLES.

Brussels Sprouts, p. hf. sieve, 1*s* to 1*s* 6*d*
Cabbages, per doz., 6*d* to 1*s*
Greens, p. doz. bun., 1*s* 6*d* to 2*s* 6*d*
Cauliflowers, p. doz., 1*s* 6*d* to 4*s*
Broccoli, p. doz. bundl., 7*s* to 12*s*
Seakale, per punnet, 6*d* to 2*s*
Asparagus, per 100, 2*s* to 8*s*
Rhubarb, p. bundl., 6*d* to 1*s* 6*d*
Potatoes, per ton, 60*s* to 100
— per cwt., 3*s* to 6*s*
— per bush., 1*s* 6*d* to 3*s*
Turnips, p. doz. bundl., 1*s* to 2*s*
Cucumbers, each, 1*s* 6*d* to 4*s*
Radishes, per doz., 1*s* to 1*s* 6*d*
Celery, p. bundle, 6*d* to 1*s* 6*d*
Carrots, per doz, 2*s* to 5*s*
Spinach, per sieve, 1*s* to 1*s* 6*d*
Onions, p. bunch, 3*d* to 4*d*
— Spanish, p. doz., 1*s* 6*d* to 4*s*
Leeks, per doz., 9*d* to 1*s*
Shallots, per lb., 6*d* to 8*d*
Garlic, per lb., 4*d* to 8*d*
Artichokes, Jerusalem, p. half sieve, 1*s* to 1*s* 6*d*
Lettuce, Cab., p. score, 6*d* to 9*d*
— Cos, per score, 1*s* to 1*s* 6*d*
Endive, per score, 1*s* to 1*s* 6*d*
Small Salads, p. punn., 2*d* to 3*d*
Horse Radish, p. bundl., 1*s* to 4*s*
Red Beet, per doz., 6*d* to 1*s*
Mushrooms, p. pot., 6*d* to 9*d*
Sorrel, per hf. sieve, 6*d* to 9*d*
Fennel, per bunch, 2*d* to 3*d*
Savory, per bunch, 2*d* to 3*d*
Thyme, per bunch, 2*d* to 3*d*
Parsley, per doz. bun., 2*s* to 3*s*
— Roots, p. bundl. 9*d* to 1*s*
Marjoram, per bunch, 2*d* to 4*d*
Mint, green, per bunch, 6*d* to 9*d*
Watercress, p. 12 bunch., 6*d* to 9*d*
Corn Salad, p. hf. sieve, 1*s* to 1*s* 6*d*

POTATOES.—Southwark, Feb. 24.

The Committee report that the market continues to be well supplied from Yorkshire and Scotland; the weather being so mild, this has been the worst week for trade we have had for the season, and it is with difficulty our highest quotations are realised. The following are the prices:—York Regents, per ton, 70*s.* to 90*s.*; Scotch do., 60*s.* to 70*s.*; ditto Cups, 50*s.* to 70*s.*; Cambridgeshire and Lincoln Regents, 60*s.* to 75*s.*; French whites, 50*s.* to 60*s.*

HAY.—Per Load of 36 Trusses.

Smithfield, Feb. 27.

COAL MARKET.—Friday, Feb. 28.

Hollywell, 15*s.*; Carr's Hartley, 14*s.*; Eden Main, 14*s.* 6*d.*; Davison's West Hartley, 14*s.*; Wallsend Haswell, 15*s.* 9*d.*; Wallsend Stewarts, 15*s.* 6*d.*; Wallsend Tees, 15*s.* 6*d.*—Ships at market, 249.

HOPS.—Friday, Feb. 28.

Messrs. Pattenden and Smith report that fine Sussex Hops are in great request, at an advance in prices.

SMITHFIELD, Monday, Feb. 24.

The supply of Beasts is again large; trade is, however, somewhat more active, and prices have recovered from the depression of Friday. The number of Sheep, although small, is sufficient for the demand. Best Downs are fully as dear as of late, but other kinds are on the average lower. There are but few Calves on offer; choice ones are readily disposed of, but it is difficult to obtain higher prices. From Holland and Germany there are 350 Beasts, 640 Sheep, and 26 Calves; from Norfolk and Suffolk, 2300 Beasts; from Scotland, 400; and 200 from the northern and midland counties.

| Per st. of 8 lbs.— | s | d | s | d | Per st. of 8 lbs.— | s | d | s | d |

| Ditto Shorn ... | ... | | | | Pigs ... ... | 2 | 8 | — 3 | 8 |

Beasts, 3713; Sheep and Lambs, 19,000; Calves, 70; Pigs, 380.

Friday, Feb. 28.

The number of Beasts is small, but fully adequate to the demand; we retain Monday's quotations, they are not, however, so readily obtained. The supply of Sheep is very short, but we cannot quote any advance, trade being rather worse at the dead markets. Trade is active for choice Calves; prices on the average are no better. Our foreign supply consists of 85 Beasts, 750 Sheep, and 158 Calves; we have 85 milch cows.

Beasts, 561; Sheep and Lambs, 2920; Calves, 257; Pigs, 350.

MARK LANE.

Monday, Feb. 24.—The supply of English Wheat continues small, and the condition generally bad, in consequence of which the greater part could only be disposed of at a reduction of 1*s.* per qr. upon the prices of this day s'ennight. Low priced foreign was taken slowly in retail, but the better descriptions are entirely neglected.—Barley of all kinds is firm at our quotations.—There is no alteration in the value of Beans or Peas.—The Oat trade continues firm, but the sale is limited.—Flour remains dull and neglected.

Friday, Feb. 28.—The arrivals of English grain into London this week have been moderate, those of foreign small. The attendance at market this morning was small, and the demand for Wheat exceedingly limited, so much so that we are unable to make any alteration in quotations. The same will apply to Barley, Beans, and Peas.—The Oat trade is firm, and prices of foreign fully supported.—Foreign and country Flour is offered on easier terms.

Liverpool, Tuesday, Feb. 25.—Our supplies of grain and Flour are this week upon a smaller scale than of late. The trade during the week has been without activity, and no change observable in the general quotations. We had another dull market to-day, and Wheat was taken sparingly by the millers, at prices for both English and foreign barely equal to those of Tuesday last. Flour also was difficult to quit, and French sacks declined 1*s.* per 280 lbs., and American barrels 6*d.* per 196 lbs. Oats were ½*d.* per bushel, and Oatmeal 3*d.* per load lower. Barley, Beans, and Peas were unchanged in value. There was rather more inquiry after Indian Corn, and prices were tolerably well maintained.—Friday, Feb 21.—At this morning's market we had a poor attendance of either local or country buyers; the trade ruled exceedingly dull for Wheats of all descriptions, the sales effected being altogether of retail extent, at nominally unaltered rates. The quantity of French Flour still pressing for sale, much of which is short of strength, causes continued difficulty in promoting transactions in such, even at 6*d.* to 1*s.* per sack decline, neither do the best marks support their late value. Fine malting Barley is now less valuable, and firm, and grinding parcels are steadily retailed at the quotations of our last. Oats and Oatmeal in limited demand, without change in prices. Beans and Peas unaltered.

TO THE TRADE.

THE Subscriber has now ready a LIST OF SURPLUS STOCK of many New and In eresting Plants, in every department. He will be happy to correspond with parties who have anything desirable to offer, and may be disposed to exchange. — ROBERT M. STARK, Nurseryman, Florist, and Botanist, Edinburgh, March 1.

STRONG TRANSPLANTED THORNS.

JOHN STEWART AND SONS, NURSERYMEN and SEED-MEN, Dundee, N.B., have 200,000 or 300,000 2 and 3 years TRANSPLANTED THORNS, which they offer at 5s. 6d. per 1000.—Dundee, March 1.

SEED AND HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

BASS AND BROWN'S SEED and PLANT LIST for 1851 is now complete, and stamped as a newspaper, to go free by post. It is prefaced with a page of Instructions for SOWING and RAISING SEEDS, with allusions to Sorts requiring peculiar treatment, and contains the following:

PART I.—FLOWER SEEDS, consisting of lists of 422 new and most showy sorts, with colour, height, hardiness, duration of each, price per packet, and other useful information.

PART II.—VEGETABLE SEEDS, with time of sowing each kind, prices of each, and other descriptive information.

PART III.—AGRICULTURAL SEEDS, containing also much useful information.

PART IV.—ROOTS, FRUITS, BULBS, &c. for early planting.

PART V.—Contains our Descriptive Priced Catalogue Lists of Show, Fancy, Scarlet, and other Geraniums; Fuchsias, Dahlias, Petunias, Verbenas, Chrysanthemums, Cinerarias, Achimenes, Gloxinias, Azalea indica; Greenhouse, Stove, and Miscellaneous Select Plants.

PART VI.—Contains NEW PLANTS of 1851.

The following Collection will be highly approved:

| VEGETABLE SEEDS. | £ | s. | d. |
|---|---|---|---|
| A collection in full proportion, one year's supply, for a large garden, of first-rate sorts, including 24 quarts of Peas, 6 quarts Broad Beans, 10 sorts Broccoli, 6 of Cabbage, 3 of Cauliflower, 8 of Lettuce, 5 of Onion, 5 of Radish, and all other sorts in proportion | 3 | 0 | 0 |
| The same collection, in smaller quantities ... ... | 2 | 0 | 0 |
| Collection, in reduced proportion ... ... ... | 1 | 0 | 0 |
| Collection, for a small garden, of good sorts ... ... | 0 | 10 | 6 |

If any vegetables not required, enlarged quantities of others sent to make up the amount. A list of the sorts furnished if required.

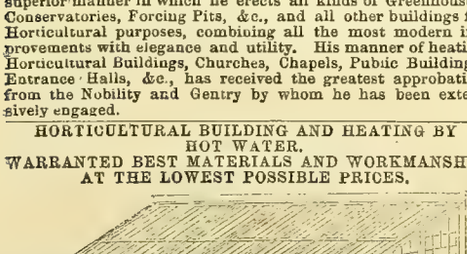
GREENHOUSES.



HENRY FREEMAN, HOTHOUSE BUILDER and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney, London, begs to solicit the attention of the gentry to his low prices for cash. Good substantial-built Greenhouses, fixed complete, 42 feet long by 13 feet wide, 90l.; 21 feet long by 13 feet wide, 50l.; 12½ feet long by 10 feet wide, 30l. A large assortment of Conservatories, Hothouses, Pits, Melon and Cucumber Boxes, Iron Hand-lights, Summer-houses, Seats, &c. Estimates in the above line, either in wood or iron.

GREENHOUSE AND CONSERVATORY BUILDING ESTABLISHMENT, HOT-WATER APPARATUS MANUFACTORY, KENSALL-GREEN, HARROW-ROAD, LONDON.

JOHN TAYLOR begs most respectfully to call the attention of the Nobility, Gentry, and Gardeners, to the very superior manner in which he erects all kinds of Greenhouses, Conservatories, Forcing Pits, &c., and all other buildings for Horticultural purposes, combining all the most modern improvements with elegance and utility. His manner of heating Horticultural Buildings, Churches, Chapels, Public Buildings, Entrance Halls, &c., has received the greatest approbation from the Nobility and Gentry by whom he has been extensively engaged.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—In consequence of a very inferior article being now too frequently sold under the name of these favourite Ales, the public are respectfully requested to apply at the respective stores, where a list of bottlers will be furnished, from whom these ales may be obtained genuine, and where also they may be had in casks of 18 gallons and upwards, either singly or in any quantity. Apply to Messrs. SAMUEL ALLSOPP and SONS, The Brewery, Burton-on-Trent, or their Stores, at 61, King-William-street, City; Cork-street, Liverpool; High-street, Birmingham; the Exchange, Manchester; and 33, Virginia-street, Glasgow.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton in dock. Sulphate of Ammonia, &c.

PHOSPHATE NODULES, OR COPROLITES AND FOSSIL BONES (from the Suffolk Crag).—Manufacturers of Superphosphate of Lime can be supplied with the above, either in their natural form or finely pulverised, on the best terms, f. o. b. or delivered in the Thames.

Applications to EDWARD PACKARD, Chemist, Saxmundham, Suffolk, will receive prompt attention.

IRISH PEAT CHARCOAL.

TO FARMERS, AGRICULTURISTS, AND OTHERS.

MESSRS. ODAMS AND PICKFORD, 35, Leadenhall-street, having been appointed by the IRISH AMELIORATION SOCIETY sole Agents, for London, for the sale of their PEAT CHARCOAL, beg to say full particulars of prices, &c., may be obtained on application to them.

ODAMS and PICKFORD, 35, Leadenhall-street, City.

DESICCATED ANIMAL MANURE.—This Manure, which has proved so eminently successful in the culture of both Cereal and Green Crops, can now be had of the Manufacturers, J. M'CALL and Co., 60, Spring Gardens, Manchester; RITCHIE and M'CALL, 137, Houndsditch, London; and of all Agents Price 7l. per ton.—Copies of Analysis and Testimonials forwarded post free on application.

PATENT CREOSOTED FISH FOR MANURE.—This manure is composed entirely of animal matter. The analysis of an eminent chemist states that one ton of the prepared fish contains 263 lbs. of ammonia, 1501bs. of phosphate of lime, and 39 lbs. of potash. It will be seen that they contain all the manuring properties of the best guano, and as they cannot be adulterated, they will be found to be a most useful manure for Potatoes, Wheat, Oats, Carrots, and all root crops. They also have the property of preventing the Potato disease. All the Potatoes planted with them last year, produced good crops, and were entirely preserved from the disease, although the neighbouring fields greatly suffered. See Report of the Royal Agricultural Society of Dec. 11, 1850. Price 5l. per ton. Orders received by Mr. HENRY HILL, Corn Exchange, Mark-lane; Mr. GEORGE BUSH, 22, Abchurch-lane; and Mr. BENNETT, 73, Mark-lane.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

IRON GATES, HURDLES, &c.

THOMAS PERRY AND SONS, 252, OXFORD-STREET (NEAR HYDE-PARK), And Highfields Wrought and Cast-iron Works, Bilston, Staffordshire, Manufacturers of every description of Park Entrance, Carriage and Field Gates, Wickets, &c.; Plain and Ornamental Fencing and Palisading; Ox, Cattle, Sheep and other Hurdles; Tree Guards, Garden Seats, Hay Racks, Wheelbarrows; Land and Garden Rollers, Stable Fittings, &c. &c.

The works being situated in the centre of the Staffordshire Iron district, THOMAS PERRY AND SONS are enabled to execute promptly orders to any extent with the greatest facility, of the best quality, and most moderate terms. A great variety of the above articles always kept in Stock at the London Warehouse, and at the Works. Drawings and prices may be obtained on application, or furnished free by post.

THE HIPPOPOTAMUS, presented to the ZOOLOGICAL SOCIETY by H.H. the Viceroy of Egypt, is Exhibited daily at their Gardens, in the Regent's Park, from 11 to 4 o'clock. Visitors desirous of seeing the Animal in the water are recommended to go early.

Admission, One Shilling; on Mondays, Sixpence.

TO THE NOBILITY AND AMATEURS OF USEFUL INVENTIONS.

INVENTION FOR SALE.—Owing to the great expense of the EXISTING PATENT LAWS and delay in the amendment thereof, the Inventor of a most useful and valuable portable Apparatus for HATCHING AND REARING GAME AND POULTRY at all Seasons, for the MILLION, and which has been successfully tested, being unable in consequence to bring out the Invention, and deterred from exhibiting at the Exhibition, determines on parting with it to any Person or Company for a certain sum. This Invention is decidedly one of a more than ordinary promising character, nothing of the kind having yet been discovered on so simple and economical a plan, with every requisite for Hatching and Rearing Poultry, and full directions for use. Within the comprehension of the most inexperienced person; the machines may be made and sold for 5l., to contain 200 Eggs. By this compendious and portable apparatus, Poultry may be Hatched in any department without additional buildings or expence. It must be evident to all that an invention of such simplicity and world-wide utility, when once brought before the public, cannot fail to bring in profits to an unlimited extent, bringing within the reach of all grades of society a hitherto unattainable and nutritious food. It is particularly adapted for Private Families and Game Preserves.—Direct to R. S. T., Mr. Dobson's, Goat-lane, Norwich.

TO BE LET, A SUPERIOR SHEEP FARM, pleasantly situated under the South Downs, near to Arundel, Sussex, consisting of about 170 Acres of Arable, 9 of Grass, and 190 of Down Pasture, with superior Farm, Residential, and Homestead accommodation. The Land lies compact and Dry, and the fields are open and of good size. The Cultivation is light, and the soil well suited to Sheep Grazing, and the alternate growth of Roots and Grain. Immediate possession to be had.—For particulars, apply to Messrs. DAVIS and VIGERS, Land Agents, 3, Frederick's-place, Old Jewry, London.

HOSE FOR LIQUID MANURE, FIRE ENGINES AND AGRICULTURAL PURPOSES, made of Canvas lined and coated with Gutta Percha. It is about one-third the price of Leather or India-rubber; it will convey liquids of all kinds under a heavy pressure; is extensively used at the Government Public Works by the Navy, and amongst Agriculturists, giving universal satisfaction. Testimonials and Prices may be obtained at Messrs. BURGESS and KEY'S, 103, Newgate-street, sole Manufacturers.

London Agents:—Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.

Country Agents:—Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. Samuel Wilson, Glasgow, agent for Scotland.

HARTLEY'S PATENT ROUGH PLATE-GLASS FOR CONSERVATORIES, &c.

See Article in the GARDENERS' CHRONICLE of Saturday, December 8, 1849.

"Continued experience leaves us no room to doubt that this is the best material yet produced, and that it will in time supersede glass of all other kinds for the greater part of Gardening purposes." . . . "As for the article substituted for Rough Plate . . . it is wholly unfit for any horticultural purpose." . . . "The best sample of it which we have yet seen was Manufactured by Messrs. HARTLEYS, AND SOLD BY MESSRS. JAMES PHILLIPS & CO., 116, BISHOPSGATE STREET."

Supplied Wholesale, Retail, and for Exportation; cut to order in panes of

## *SALES BY AUCTION.*

HIGHBURY NURSERY.

To Gentlemen, Nurserymen, Proprietors of Tea Gardens, &c.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, on the Premises, Highbury Nursery, opposite Highbury Barn Tavern, Islington, on MONDAY, March 3d, 1851, and following day, at 11 o'clock each day, by order of the Proprietor, in consequence of the land being let for building, the whole of the CHOICE NURSERY STOCK, consisting of fine Evergreens, Deciduous Shrubs, and Ornamental Trees; also, the selected Greenhouse Plants, comprising large Camellias, Azalea indica, large Araucaria, Rhododendron Arborea, Oranges, Myrtles, Ficus elastica, Geraniums, Fuchsias, Cyclamen, &c.; together with the Pits, Frames, and Lights, Hand-glasses, Wheelbarrows, a quantity of well-seasoned Bog, Potting Mould, &c.; a Summer House; an Erection for Tea Booth, 36 feet by 18; Tables, Forms, Tea Trays, Crockery; 2 Coppers; a Swinging Boat; Utensils in Trade, &c. May be viewed prior to the Sale; Catalogues had, 6*d.* each (returnable to Purchasers), on the Premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on THURSDAY, March 6th, about 200 choice DOUBLE CAMELLIAS, from 18 inches to 5 feet, beautifully furnished with bloom buds, and in the finest state of cultivation; strong Camellia Stocks; also a choice assortment of Standard and Dwarf Roses, consisting of Noisettes, Hybrids, Bourbons, Perpetuals, &c.; a fine collection of American Plants, comprising Gheut and other Azaleas, Andromeda floribunda, Kalmias, Ledum, &c.; choice Dahlias in dry roots, Pæonies, Fuchsias, Verbenas, &c. —May be viewed the morning of sale. Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

FINAL SALE.—SOUTHAMPTON.

TO GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS ENGAGED IN PLANTING.

MESSRS. PROTHEROE AND MORRIS are instructed to submit to an unreserved sale, by Auction, on the premises, Page's-hill and Sidford and Above-bar Nurseries, Southampton, on TUESDAY, March 11th; and following day, at 11 o'clock, the whole of the remaining NURSERY STOCK, consisting of Evergreens, Ornamental Fruit and Forest Trees, Stove and Greenhouse Plants; together with six 2 and 3-light Boxes, Chaise Harness, Garden Pots, Flower Seeds, &c.—May be viewed, and Catalogues had, one week prior to the sale, on the premises; of Mr. BROOKS, 24, Portland-street, Southampton; at the principal Inns in the neighbourhood; Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

MR. HASLAM begs to inform the Public that he will sell, at the Auction Mart, on WEDNESDAY, March 5, and two following days, an extensive importation of DUTCH FRUIT TREES, in Standard and Trained; also a large assortment of Double Camellias, well set with opening bloom, Perpetual Standard Roses, Azalea Indica, Evergreen Shrubs, Ranunculus, Anemones, Gladiolus, &c. To be described in Catalogues, to be had at the Mart, and of the Auctioneer, South Essex Nurseries, Epping, Essex.

IRISH PEAT CHARCOAL.

TO FARMERS, AGRICULTURISTS, AND OTHERS.

THE IRISH AMELIORATION SOCIETY beg to draw the attention of the public generally to the fertilising and deodorising properties of Irish Peat Charcoal. Mixed with night-soil or sewage matter it instantly and wholly destroys all offensive smell, renders it easy of manipulation, adapts the fertilising properties as a ready food for plants, and enables it to be transported by Railway or any other conveyance without the slightest inconvenience.

The extent to which Charcoal (carbon) enters into the composition of every article of agricultural produce, and the value of night-soil as a manure, render any observations on these points unnecessary. Mixed with night-soil, in about equal weights, a most efficacious manure is produced at a very small cost.

Price of the Charcoal, ready for use, at Dublin, 47*s.* per ton; in London, Liverpool, Bristol, and other seaports in England, 60*s.* per ton, sacks included.—Agents for the sale of the Society's Charcoal have been appointed at several of the principal seaports and Inland towns, a list of whom, together with all other information, may be had on application at this office.

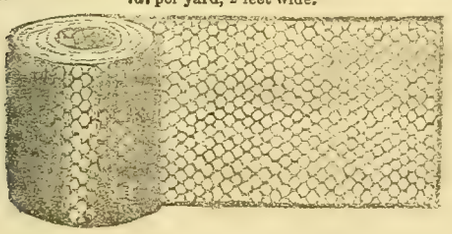
By order of the Court,

March 1, 1851. GEORGE L. PARROTT, Secretary.

Head Office, 9, Waterloo-place, London.

MANURE DEPOT.—PEAT CHARCOAL.

TO FARMERS, AGRICULTURISTS, AND OTHERS.



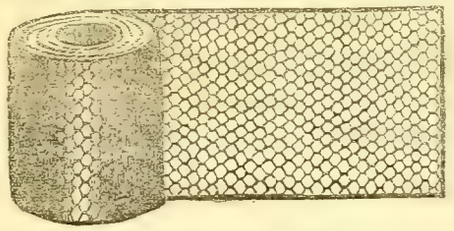
G. H. FOLEY, Essex Coal Wharf, Lea-bridge, Middlesex, Agent by appointment to the Irish Amelioration Society, for the sale of the above. All needful particulars will be given on application at the above address.

Price of the unmixed Charcoal, 60*s.* per ton, sacks included. Mixed with Nightsoil, 45*s.* per ton, sacks included.

ART UNION OF LONDON.—In consequence of numerous enquiries, the Council think it necessary to state that the Pair of Prints, "The Smile" and "The Frown," may be had for a subscription of the current year, with a series of outlines, and a chance in the distribution of obtaining the right to select a work of art.—No. 444, West Strand, March 1.

GEORGE GODWIN and LEWIS POCOCK, Hon. Secretaries.

GALVANISED WIRE GAME NETTING.—*7d.* per yard, 2 feet wide.



| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24-inch wide ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch " strong " ... | 9 " | 6½ " |
| 2-inch " extra strong " ... | 12 " | 9 " |
| ¾-inch " light " ... | 8 " | 6 " |
| 1½-inch " strong " ... | 10 " | 8 " |
| 1½-inch " extra strong " ... | 14 " | 11 " |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | | | |
|---|---|---|---|---|---|
| 12 inches wide | 3*d.* | per yard. | 30 inches wide | 7½*d.* | per yard. |
| 18 " | 4½*d.* | " | 36 " | 9*d.* | " |
| 14 " | 6*d.* | " | 48 " | 1*s.* | " |

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are F. M'NEILL AND CO.'S Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

FARMS AT STANTON FITZWARREN, NEAR HIGHWORTH, WILTS,

And within about four miles of the Swindon and Shrivenham Stations, on the Line of the Great Western Railway.

TO BE LET BY TENDER, from MICHAELMAS, 1851,

PARSONAGE FARM, comprising a Farm-house and requisite Outbuildings, with

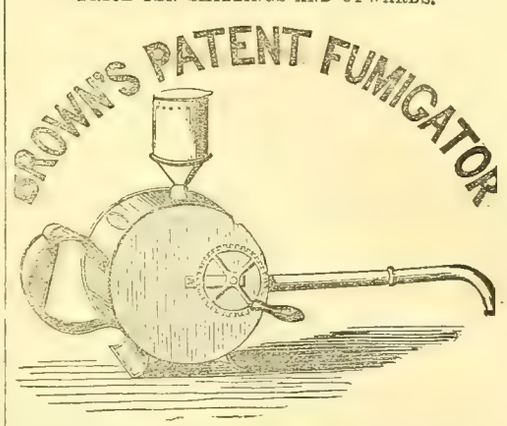
| A. | R. | P. | |
|---|---|---|---|
| 183 | 1 | 19 | of Arable Land, and |
| 38 | 1 | 12 | of Meadow, Pasture, and Homestead. |
| Total 221 | 2 | 31 | |

AKER'S FARM, comprising a Farm-house and requisite Outbuildings, with

| A. | R. | P. | |
|---|---|---|---|
| 225 | 3 | 32 | of Arable Land, and |
| 75 | 0 | 28 | of Meadow, Pasture, and Homestead. |
| Total 301 | 0 | 20 | |

HUNTER'S FARM, with a Farm-house and Outbuildings, and

| A. | R. | P. | |
|---|---|---|---|
| 50 | 2 | 37 | of Arable Land, and |
| 53 | 1 | 29 | of Meadow, Pasture, and Homestead. |
| Total 104 | 0 | 26 | |

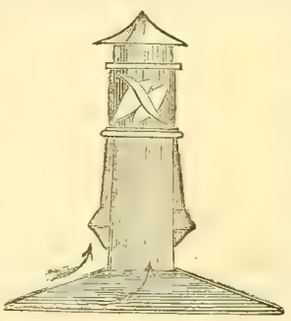


MATTHEW'S FARM, with a Farm-house and Outbuildings, and

| A. | R. | P. | |
|---|---|---|---|
| 18 | 3 | 10 | of Arable, and |
| 57 | 3 | 30 | of Meadow, Pasture, and Homestead. |
| Total 76 | 3 | 0 | |

To view the Farms, and for further particulars, apply at Stanton House, near Highworth, Wilts. Sealed Tenders to be sent, addressed to the Rev. J. A. TRENCHARD, at the same place, on or before the 25th March next.

March 1.



PRICE TEN SHILLINGS AND UPWARDS.

A PORTABLE INSTRUMENT for Fumigating Greenhouses, Stoves, and Frames, or Shrubs and Flowers, in the open air, without injuring the most delicate plant; delivering the smoke cool, in a dense mass, and effecting a great saving of Tobacco.

Manufactured and supplied to the Trade by Messrs BARBER and GROOM, London; and may be had of all Ironmongers, Seedsmen, and Florists.

PASCAL'S PATENT FUMIVORE AND SELF-ACTING VENTILATOR.—The attention of the public is respectfully directed to this truly valuable invention. The scientific arrangement of this apparatus entirely obviates the inconvenience and annoyance of Smoky Chimneys, arising from any cause whatever. It is also adapted to all purposes of sanitory ventilation, particularly in places of public resort. Schools, Chapels, Barracks, Banks, large retail Shops, Hospitals, Taverns, and Ships' cabins, and such other places where gas is consumed or close stoves are in use. The three vanes or fans, as shown in the section, are set in rapid motion by the ascensive force of the heated air or smoke, causing a powerful exhaustion or withdrawal of the smoke from the chimney or vitiated air generated in close rooms. It obviates the necessity of all chimney stacks or high tubes.

For particulars apply to Mr. SEPTIMUS BRAITHWAITE, 108, Great Russell-street, Bloomsbury, where contracts may be entered into for the warming by improved methods, and ventilating of any building.

DEPARTURE OF THE MAIN BODY OF CANTERBURY COLONISTS, for 1851. Under the Management of the Canterbury Association (Incorporated by Royal Charter, 13th November, 1849).

The ARCHBISHOP OF CANTERBURY, PRESIDENT.

The COUNCIL of CANTERBURY COLONISTS, forming the Main Body for 1851, hereby give notice that their first ships will sail from the Port of London for Port Lyttelton on Thursday, the 8th of May.

The First-class Ship DOMINION, already Chartered, may be inspected at her berth in the East India Dock. Information concerning freight and passage in the chief cabin, second cabin, steerage cabin, and steerage of these vessels, will be given on board the Dominion, and at the Shipping Office of the Canterbury Association, 74, Cornhill.

A limited number of Assisted Passages in the Steerage will be granted to persons of the Working Classes, being gardeners, shepherds, farm servants, labourers, and country mechanics, for which application should be made at the Emigration Office of the Canterbury Association, 9, Adelphi-terrace, Strand.

For the Council of Colonists,

CHARLES SIMEON, Chairman.

The First-class Ship, Labuan, now in berth alongside the Dominion, will sail from the Port of London on Tuesday, the 8th April.

**GREAT WESTERN, SOUTH-WESTERN, AND SOUTH-EASTERN RAILWAY SEED ESTABLISHMENT, READING, BERKS.**

*FOR SUPPLYING HOME-GROWN SEEDS, CARRIAGE FREE, to any Railway or Packet Office in London, Bristol, Oxford, Gloucester, Exeter, Southampton, Portsmouth, Dover, or to any other Station on the above-named Railways.*

PRESENT CASH PRICES OF

# Natural Grass Seeds, Clovers, Turnips, Mangolds,

**AND OTHER AGRICULTURAL SEEDS, CARRIAGE FREE.**

## GROWN AND SOLD BY JOHN SUTTON & SONS, SEED GROWERS, READING, BERKS.

Under the Patronage and Recommendation of Several of the Leading Members of the Royal Agricultural Society.

Having various kinds of Land, situate in different localities, which we occupy for the purpose of GROWING SEEDS TRUE TO THEIR KINDS, and proving the comparative merits of each sort, we are enabled to supply our customers with Seeds of the best kinds in cultivation, and of such quality as to prevent disappointment, which system has gained us an increasing connection during upwards of 40 years.

*In proving the germinating qualities of Seeds, we do not trust to experiments made under glass, but subject them also to the trial of open ground sowing; and when, on a recent occasion of considerable interest in the Seed Trade, one of our Firm was subpœnaed to give evidence before* LORD CHIEF JUSTICE CAMPBELL *and a Jury of Agriculturists, as to the most certain test of the vegetative properties of Seeds, his Lordship highly complimented us upon our system of conducting our business, and further said—"Well,* Mr. SUTTON, *if I should have occasion for Seeds, I shall certainly apply to you, because you appear to act so fairly."*—See "Times" of July 22, and other Daily Papers.

# NATURAL GRASSES, PERENNIAL CLOVERS, &c.

The following sorts of NATURAL AND ARTIFICIAL GRASS MAY BE HAD SEPARATE, at the low prices annexed to each. All the best and most suitable of them are contained in Messrs. SUTTON'S Mixtures for the several purposes described below :—

| | Per lb.—s. d. |
|---|---|
| Achillea millefolium (Yarrow) | 2 6 |
| Agrostis stolonifera (Creeping Bent Grass) | 1 3 |
| Anthoxanthum odoratum (Sweet Vernal) | 1 9 |
| Alopecurus pratensis (Meadow Foxtail) | 1 0 |
| Avena flavescens (yellow Oat Grass) | 2 0 |
| Aira cæspitosa (Tufted Hair Grass) | 1 3 |
| Aira lutescens (yellow Hair Grass) | 2 0 |
| Agrostis alba (white Bent Grass) | 1 3 |
| Agrostis canina (Dog Bent Grass) | 1 6 |
| Agrostis vulgaris (common Bent Grass) | 1 3 |
| Bromus arvensis (Field Brome Grass) | 1 0 |
| Cynosurus cristatus (Crested Dogstail) | 1 0 |
| Dactylis glomerata (round-headed Cocksfoot) | 0 9 |
| Festuca duriuscula (hard Fescue) | 1 0 |

| | Per lb.—s. d. |
|---|---|
| Festuca loliacea (Darnel Fescue) | 1 0 |
| Festuca ovina (Sheep's Fescue) | 1 0 |
| Festuca rubra (Red Fescue) | 1 3 |
| Festuca pratensis (Meadow Fescue) | 0 10 |
| Festuca elatior (Tall Fescue) | 1 0 |
| Festuca heterophylla, various leaved | 1 3 |
| Festuca tenuifolia (fine-leaved Fescue) | 1 3 |
| Glyceria fluitans (floating sweet Grass) | 1 6 |
| Glyceria aquatica (water sweet Grass) | 2 0 |
| Holcus avenaceus (tall Oat like Grass) | 0 9 |
| Holcus lanatus (Woolly Grass) | 0 9 |
| Hordeum bulbosum (Bulbous Barley Grass) | 3 6 |
| Lolium perenne (Perennial Rye-grass) | 0 5 |
| Lolium perenne sempervirens | 0 6 |
| Lolium perenne Paceyanum | 0 6 |

| | Per lb.—s. d. |
|---|---|
| Lolium perenne Stickneyanum | 0 6 |
| Lolium perenne tenue | 0 8 |
| Lolium Italicum (Italian Rye-grass) | 0 9 |
| Lotus corniculatus (Bird's-foot Trefoil) | 3 6 |
| Medicago lupulina (Black Medick Grass; or yellow Trefoil) | 0 4 |
| Milium effusum (Wood Millet Grass) | 2 6 |
| Phleum pratense (Timothy) | 0 10 |
| Poa nervosa (Nerved Meadow Grass) | 2 0 |
| Poa nemoralis (Wood Meadow Grass) | 1 6 |
| Poa pratensis (Smooth Meadow Grass) | 1 0 |
| Poa trivialis (Rough Meadow Grass) | 1 0 |
| Poa angustifolius (Narrow-leaved) | 1 9 |
| Poa fertilis (Fertile Meadow Grass) | 1 9 |
| Poa sempervirens (Evergreen) | 2 0 |
| Trifolium minus (Red Suckling) | 0 10 |

| | Per lb.—s. d. |
|---|---|
| Trifolium pratense perenne (Perennial Red Clover) | 0 9 |
| Trifolium repens (White Clover) best | 0 8 |
| Trifolium hybridum (Alsike Clover) | 1 6 |
| And many others. | |
| The following kinds are also sold by measure, at the prices affixed. | |
| | Per bushel.—s. d. |
| Cocksfoot | 6 0 |
| Meadow Fescue | 9 0 |
| Hard Fescue | 9 0 |
| Sheep's Fescue | 10 0 |
| Italian Rye-grass | 7 0 |
| True Perennial Rye-grass | 7 0 |
| Common Rye-grass | 0 0 |
| Holcus avenaceus | 5 0 |

*As some Agriculturists feel a pleasure in making their own selection of Grass Seeds, the above List is presented with their lowest Market Prices (much lower than is usually charged,) but the greatest economy and certainty of success will be obtained by procuring* Messrs. SUTTON'S *Mixtures as under. In these Mixtures the large and small Seeds are thoroughly incorporated, so as to insure proper combinations of sorts throughout the land sown; but, if it should be preferred, the large Seed may be had in one Mixture, and the small in another, to be sown at two casts.*

## Mixtures for laying down to Permanent Meadow or Pasture.

The sorts contained in these Mixtures are grown in different localities, and gathered separately, by the hand, expressly for this purpose, by which means all noxious weeds are excluded, and each sort being kept separate, they are subsequently mixed in such sorts and proportions as are most natural to the soil to be laid down. The annually increasing demand for Messrs. SUTTON'S Seeds has enabled them on a larger scale to grow and collect the Seeds at much less expense than formerly; so that a mixture which *a few years since* would have cost 45*s.* or 50*s.* per acre, *can now be supplied for* **24s.** *to* **28s.** *per acre,* according to the sorts which the soil may require.

### Mixtures for Reclaimed Marshes and Heath Lands.

Many acres of Land of this description have been successfully laid down to Permanent Pasture by Messrs. SUTTON, with Seeds which they have found invariably to thrive on such soil; and *the cost for this purpose will be but* **22s. 6d.** *per acre.*

### Mixtures for laying down Chalky or Gravelly Uplands and Sheep Downs.

For this purpose Grass Seeds are annually collected from dry and hilly districts, where they are found growing spontaneously; and, after many years' experience, Messrs. SUTTON can confidently assure their friends that a *good and permanent* Sward may be obtained on *any* upland, however dry or poor the soil. Cost of Seeds, **28s.** per acre.

## Mixtures for Irrigation or Water Meadows.

In this department also Messrs. SUTTON have been very successful, many customers having expressed their great gratification at the effect of these Seeds; one of these, an eminent Agriculturist, and MEMBER OF THE COUNCIL OF THE ROYAL AGRICULTURAL SOCIETY, has contributed A VALUABLE ESSAY ON THIS SUBJECT, which has recently been published by that Society in their Journal (Vol. X., Part II., page 462.) COST OF SEED NOW REDUCED TO **26s.** PER ACRE.

### Mixtures to lay down New Park Lawns.

For this purpose all coarse-growing kinds are carefully excluded, and the Sward will at all seasons present a luxuriant verdure so desirable in Parks contiguous to the Mansion. The cost of Seeds for this purpose will vary according to the nature of the soil, and other circumstances.

## Renovating Mixture for Improving Old Pastures.

Many old Upland Pastures, Parks and Meadows, are nearly destitute of Clovers, and the finer and more nutritious sorts of Grasses, in which case Messrs. SUTTON are in the practice of furnishing such sorts only as are wanting; if these Seeds are SOWN EARLY IN THE SEASON, the improvement in the Pasture will be very considerable, and at a small expense. Quantity of Seed required, 6 to 8 lbs. per acre **Price reduced to 10d. per pound.**

### Fine Grass Lawns in Flower Gardens, &c.

The great expense of cutting and carting turves from a distance may be avoided, and a SUPERIOR turf produced in a few months, by sowing Messrs. SUTTON'S LAWN GRASS SEEDS, which consist solely of the finest and shortest growing kinds, perfectly free from moss and other weeds. Price **3s.** per Gallon, or **21s.** per Bushel, or **1s. 3d.** per pound.

Goods Delivered Free of Carriage to London, Bristol, Bath, Exeter, Gloucester, Oxford, Southampton, &c.—Sacks and Bags are charged at cost price only, and the full amount allowed if they are returned.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex. Printers at their Office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said County, where all Advertisements and Commmunications are to be ADDRESSED TO THE EDITOR.—SATURDAY, MARCH 1, 1856.

The above will be forwarded to any part on receipt of a post-office order, payable at Richmond.

A Descriptive Catalogue of Fuchsias and Verbenas, Geraniums, Dahlias, Pansies, Cinerarias, Petunias, Chrysanthemums, Stove, Greenhouse, Bedding Plants, &c., may be had on application.—Gilling, Richmond, Yorkshire.

ESTABLISHED 1786.

WILLIAM E. RENDLE AND CO., SEED MERCHANTS by special appointment to the SOUTH DEVON AGRICULTURAL ASSOCIATION, and several influential Members of the Royal Agricultural Society, Union Road, Plymouth.

We have this season a choice and well assorted Stock of all the best FARM SEEDS. They have been grown and selected with the greatest care, and can be highly recommended as being of the most genuine quality. Our sale of Turnip Seeds alone last season exceeded *one thousand bushels*; our extensive dealings therefore enable us to sell at the lowest remunerating prices, and at the same time is the strongest evidence we can offer of the large and increasing patronage bestowed upon us, for which we have to return our most grateful acknowledgments.

OUR DESCRIPTIVE CATALOGUE OF FARM SEEDS *is just published, and can be had in exchange for One Penny Stamp. It contains a description of all the best varieties of Turnips, Carrots, and Mangold Wurzel, with prices affixed to every article. The list of Grasses is peculiarly comprehensive, and contains short descriptions of all the leading kinds. There is also some useful advice relative to the sowing of Grass Seeds for permanent pasture, concerning which* Mr. KEMP, *of Birkenhead Park, in a letter to us says:—"I am glad that you repudiate the practice of sowing Corn with Grass Seeds, a custom I have often had to combat."*

All Orders above 2*l*. Carriage Free. (See Catalogue.)

Apply to WILLIAM E. RENDLE and Co., Seed Merchants, Plymouth.

TO THE TRADE.

THE Subscriber has now ready a LIST OF SURPLUS STOCK of many New and Interesting Plants, in every department. He will be happy to correspond with parties who have anything desirable to offer, and may be disposed to exchange.—ROBERT M. STARK, Nurseryman, Florist, and Botanist, Edinburgh, March 8.

EARLY ALBION KIDNEY POTATO.

EDWARD MITCHELL having a surplus stock of SEED POTATOES of this first-rate early variety, begs most respectfully to offer them to the public, and the trade generally, as being one of the very best and earliest varieties grown, it being full three weeks earlier than the Ash-leaf or Walnut-leaf Kidney Potatoes; also a greater cropper, and far superior in flavour, than any other variety grown. Price, per bushel, 8*s*., with the usual discount to the trade.

EARLY COLCHESTER.—A round variety, of superior quality, as early as the Early Frame, but a more prolific cropper, and of first-rate flavour. Price 6*s*. per bushel, with the usual discount to the trade.

Post-office orders are expected from unknown correspondents.

Bristol Gardens, Kemp-town; and 55, Marine Parade, Brighton.

ROSES.

ADAM PAUL AND SON beg to inform their friends and the public in general that they have still a good stock of most of the leading kinds of ROSES, which, when the selection is left to them, they offer on the following advantageous terms:

| | |
|---|---|
| Standard Roses, in 12 superior vars., | 18*s*. to 24*s*. per doz. |
| Dwarf Standard do. do. | 12*s*. to 18*s*. ,, |
| Climbing Roses do. | 9*s*. to 12*s*. ,, |

A priced descriptive Catalogue forwarded on receipt of one postage stamp.

All packages delivered free of carriage to London.

Nurseries, Cheshunt, Herts, March 8.

THE PLANTING SEASON.—WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WM. WOOD AND SON having still on hand a very extensive and superior stock of ROSES, will be happy to supply collections as under (the selection of sorts being left to themselves). The plants are remarkably strong and healthy, and none but first-rate kinds will be sent.

| ROSES. | Per dozen. |
|---|---|
| Extra tall Standards, budded with from 3 to 6 best varieties on a stem | 42*s*. to 60*s*. |
| Extra superior selected Standards | 18*s*. to 24*s*. |
| Fine Dwarfs and Dwarf Standards | 10*s*. to 16*s*. |
| Superb do. do. (for exhibition) | 18*s*. |
| Fine Dwarfs, on own roots, in 50 varieties, per 100 | 50*s*. |
| Good do. do. without names, per 100 | 30*s*. |

N.B. A liberal quantity of plants will be given over with each order. Catalogues free on application.

Rose Nippers, of various sizes, for pruning, 2*s* 6*d*. to 4*s* each. The Nippers are of an improved shape, being made so as to remove a shoot without bruising the part left; they are highly recommended as a useful addition to the implements of amateurs. Metallic Labels for pot Roses 2*s* per 100.

NEW AND CHOICE FLOWER SEEDS, GERMAN STOCKS, GERMAN ASTERS, &c.

J. C. WHEELER AND SON, NURSERYMEN and SEEDSMEN, by Official Appointment, to the Gloucestershire Agricultural Association, 99, Northgate-street, Gloucester, have selected, out of a large collection of Flower Seeds, 20 of the most beautiful and showy varieties, each sort distinct in colour, and calculated to produce a fine effect when planted out in beds or groups in the flower border. Each variety is distinctly marked with its Botanical and English name, height, time of flowering, colour of the flower, manner of growing, whether erect or trailing, &c., &c., the time it should be sown, and other valuable hints as to its cultivation. In selecting these 20 varieties, care has been taken to exclude all which are shy-bloomers, or have an insignificant appearance; so that the collection will comprise only those which are really showy and handsome, and which, it is believed, would prove to the entire satisfaction of any lady or gentleman who might be disposed to order them. The German Stocks and Asters especially are most superb.—The 20 Packets are neatly packed up in one paper, and will be sent free by post, to any part of the Kingdom, for 5*s*.

# PRICE LIST OF GENUINE SEEDS FOR 1851.

GEORGE BAKER begs most respectfully to tender his sincere thanks to his numerous Patrons, who, for so many years, have favoured him with their orders; and to assure those who have not yet given him a trial, that all orders entrusted to his care shall meet with prompt attention, every article shall be of the best quality, and care ully proved before sent out. The following choice collection of Garden Seeds are now ready for sending out, carefully packed in cases, for 1*l.* 1*s.*; cases not charged.

Anemones free by post, 8*d.* per dozen extra, or 3*s.* per 100.

Bass and Brown, Seed and Horticultural Establishment Sudbury, Suffolk.

---

CAMELLIA STOCKS FIT FOR IMMEDIATE WORK.

RENE LANGELIER, Clarendon Nursery, St. Helier, Jersey, begs to inform the Public that he has a very extensive stock of the above, fit for immediate grafting, very clean and healthy, well rooted, so as to leave without the pot, consequently much less expense in conveying to any distant place. Price 36*s.*, 40*s.*, and 50*s.* per 100.

The Stock is such as has never before been offered to the Public by any grower.

R. L. has a most extensive collection of Double Camellias at a very moderate rate and reduced price, as will be seen by a Catalogue recently published, in which it is proved that they can stand the climate out-of-doors without protection. The Catalogue can be had of R. L. by inclosing four penny stamps Remittance or reference from unknown correspondents

---

"HERO OF SURREY" CUCUMBER.

J. BURLEY begs to inform the public that he has the pleasure of offering the above new Cucumbers with confidence, as a first-rate one for Ridge or Frame, he having grown it from 20 to 24 inches on the ridge last season, without any bottom heat. It can be had in 2*s.* packets, of Eight Seeds, of the following Nurserymen and Seedsmen, who have kindly offered to be Agents:—Mr. John Kernan, Covent-garden; Messrs J. A. Henderson & Co., Pine Apple-place; Messrs. Clark, Borough; Mr. Edward Tiley, Bath; Mr. W. J. Epps, Maidstone; Mr. J. Smith, Westerham, Kent; Messrs. Rendle, Plymouth.—A reference, or the amount in Postage Stamps, will oblige.—Limpsfield, Godstone, Surrey.

---

HOLLYHOCK SEED.

EDWARD TILEY begs to inform the lovers of that beautiful flower that he has been successful in procuring a quantity of good sound SEED of the above from an Amateur Gentleman who has one of the most superb and choice collections in cultivation, the seed having been selected with every care and attention; he can confidently recommend it. Sold at 2*s.* 6*d.* per packet, containing 150 seeds, or 5*s.* for a packet of 400 seeds.

GERMAN ASTER SEED.

Unequalled for the superiority of flower, the shape of which forms that of half a globe, and has been admired by thousands of spectators at numberless exhibitions. There are from 20 to 30 varieties, 1*s.* per packet.

SWEET-WILLIAM SEED.

Saved from 24 superb varieties. The flowers are very large, and of dwarf habit. They were much admired when in bloom, by countless spectators, and the Seed numerously ordered by them; 1*s.* per packet.

ANTIRRHINUM SEED.

E. T. being a most extensive grower of all the choicest sorts known in cultivation, has selected the Seed with great care from the finest varieties, as to colour, shape and habit of plant. There are more than 50 distinct varieties; 1*s.* per packet.

DWARF ORANGE AFRICAN MARIGOLD SEED.

Unrivalled for its superior size and darkness of colour, many of the flowers last season measuring 5 inches over, and not more than 1 foot high; 6*d.* per packet.

Or, if preferred, a 5*s.* packet of Hollyhock and a packet of each of the above varieties for 7*s.*

| | | |
|---|---|---|
| Walcheren Cauliflower Broccoli (as imported) | 1*s.* 0*d.* | p. packet. |
| Tamworth Broccoli ... ... ... ... | 1 0 | ,, |
| Wilcove Broccoli ... ... ... ... | 1 0 | ,, |
| Cole's Superb Solid Celery ... ... ... | 0 6 | ,, |

A remittance must accompany the order, either in cash or penny postage stamps for the amount.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath.

---

VERY FINE TWICE TRANSPLANTED SPRUCE FIRS AND BRITISH OAKS.

MESSRS. WOOD AND INGRAM beg to offer SPRUCE FIRS as above, 2 to 3 feet, 3*s.*, and 3 to 4 feet, 35*s.* per 1000. These are very fine stuff, well feathered to the ground. British Oaks, 6 to 8 feet high (raised from very fine trees in Brampston Park, the seat of Lad O. B. Sparrow), at 60*s.* per 1000. These are admirably adapted for filling up old plantations, being stout in proportion to the height. If 10,000 are taken a reduction will be made.

Huntingdon Nurseries, March 8.

---

JOHN WILMOT (late WILMOT and SON), begs to inform the Nobility, Gentry, and the Trade, that any orders they may honour him with will be attended to with the same punctuality as during his father's life-time.

Isleworth, March 8

---

THE BLACK AUSTRIAN PINE.—"PINUS AUSTRIACA."

LUCOMBE, PINCE, AND Co. have a large and healthy stock of this most desirable Pine, exceeding 300,000, from 9 inches to 3 feet high, which having been frequently transplanted, are well rooted and safe to remove; they can offer them, varying according to age and quality, from 20*s.*, 40*s.*, to 60*s.* per 1000. This Pine has been proved to thrive in bleak and exposed places, and in the poorest soils; growing rapidly and producing dense shelter in places where other trees will not grow; it also thrives well close to the sea, resisting the spray and roughest winds.

Exeter Nursery, March 8

---

AMERICAN PLANTS.

C. LODDIGES AND SONS, in consequence of part of their Nursery being given up for building, are enabled to offer for cash—

Finest Ghent Azaleas, strong bushy plants named, and being well set with buds, are peculiarly adapted for forcing, 18*s.* per doz.

Azalea pontica, large, 12*s.* per doz.
Andromeda floribunda, 3 to 4 feet across, 10*s.* each.
Vaccinium, 30 species, 12*s.* per doz.
Andromeda Ditto 24*s.* per doz.

Post-office Orders to be made payable at Hackney, near London.

---

MITCHELL'S ROYAL ALBERT RHUBARB has proved itself to be the earliest, finest flavoured, and most productive kind, as well as the best for early forcing, ever yet grown. Strong roots, 12*s.* per dozen. Also Myatt's Linnæus, 12*s.* per dozen; and Victoria, 9*s.* per dozen; with usual allowance to the trade Post-office orders are requested to be made payable to WILLIAM MITCHELL, Enfield Highway, Post-office, Enfield, Middlesex.

---

| Brachyseras ... | 1 6 | Tricolorum ... | 1 6 |

Prices to the Trade on application.—Clapton Nursery, London.

---

MESSRS. HAY, SANGSTER, AND CO. will be ready to supply their prepared POTATO CUTTINGS about the middle of April next, the produce of which proved so highly satisfactory last, as well as the experimental trials of the three former years, as to QUALITY, QUANTITY, and SIZE, being more than double the crop this year of those planted in the usual way, and containing a much larger quantity of starch, which is so essentially necessary to the preservation of that valuable root. A report of the analysis will be found below. Our own experiments give about one-third more saccharine matter than the best we could procure grown under the old system. All orders must be to hand on or before the end of the second week in April, as H. S. and Co. are preparing to plant a large breadth, and will only provide for what may be ordered up to that time. Post-office orders to be made payable to JOHN SANGSTER, at the Borough Post-office, Southwark. Printed instructions for planting and management will be sent with the plants ordered.

Package and delivering to any Carriers' Office in London, 1000 to 5000, 1*s.*—Newington Butts, London, Feb. 22.

*** We have examined a sample of Potatoes, called York Regents, grown by Messrs. HAY, SANGSTER, and Co., in comparison with two other samples of Potatoes of the same denomination, obtained by ourselves from a highly respectable Potato Salesman, with a view to ascertain the amount of starch contained in each, with the following results—viz.,

| | Starch. |

MAURICE SCANLAN, F.C.S., Chemical Works, George-street, Bermondsey; ALFRED ANDERSON, F.C.S., Experimental Chemist, Great Suffolk-street, Southwark.

---

RARE AND BEAUTIFUL COLUMBINE.—The Subscribers have for Sale strong Roots of AQUILEGIA GLANDULOSA, sent free by post at 2*s.* 6*d.* per pair, or 9*s.* per dozen, and Seeds at 1*s.* per packet, or for stamps of that value. Respecting this beautiful flower, Dr. LINDLEY, in the *Gardeners' Chronicle*, says, "This plant is perhaps the handsomest hardy perennial in cultivation;" and having described it he adds, "No description that we have formerly given of it has done justice to its exquisite appearance." The trade supplied at the wholesale rate.

JOHN GIBSON and Co., Nurseries, Forres, N.B.

---

NORMAN'S "LORD NELSON" NEW PICOTEE. The best-edged purple-rayed, quite free from spot or bar, and good pod, with superb white and large petals, 10*s.* 6*d.* per pair, warranted a fine show variety. Catalogues on pre-paid application to BENJAMIN NORMAN, Florist, Bull Fields, Woolwich.

---

PINES.—TO BE SOLD, a Quantity of Fruiting and Succession Pines. The Plants are perfectly clean and healthy, and may be seen on application to Mr. PHILLIPS, Stamford, Lincolnshire.

---

MORGAN'S KING OF THE DAHLIAS.—The entire Stock will be sold to any one making early application; or otherwise, in ground roots at five guineas each, or pot roots at two guineas each; Plants first week in May, 10*s.* 6*d.* each. The usual allowance to be made to the trade where a dozen are ordered. The roots are now beautifully broke. This Dahlia was named by Mr. Glenny; and for further particulars see "Glenny's Garden Almanac," page 94; and also "Glenny's Journal," Dec 14th, 1850. In his answers to Correspondents he says, "We will never give another opinion of a Dahlia publicly, if 'The King of the Dahlias' does not prove the best of all the Crimsons; and we shall be dreadfully disappointed if it be not the best of all the Dahlias, not barring colour. We may be wrong, but if so we will never be wrong any more; and we are quite sure of its being the most extensively grown of any." A remittance will be required from unknown correspondents.

A MORGAN, Cross-street, Oswestry, Shropshire.

---

STANWICK NECTARINE—SALE OF, IN AID OF THE FUNDS OF THE GARDENERS' BENEVOLENT SOCIETY.

Circumstances have rendered it necessary to modify the intentions expressed at p. 676 of the *Gardeners' Chronicle*, respecting the STANWICK NECTARINE. Upon examining the young plants in Mr. RIVERS's hands, it turns out that the number fit for sale is much smaller than was anticipated, and that there is a considerable difference in their quality. Applicants are moreover anxious to obtain their plants without loss of time, and without waiting for the chance of an auction which cannot take place, to the advantage of the charity, sooner than next spring. It has therefore been resolved to set aside the finest plants for sale at from 4 to 5 guineas each, and to dispose of others at 3 guineas each. Such as are unsold in the spring, if there should be any left, will be brought to the hammer as at first proposed.

Of the selected specimens, some are beautiful plants in pots, budded on the Peach stock, and covered with blossom-buds, so that they will fruit next year if repotted; for these five guineas will be charged. The remainder are very fine maiden plants in the open quarter, budded on Plum stocks, and with fruit blossom-buds; for these 4 guineas are required. Gentlemen desirous of aiding the excellent charity to whose funds the produce of the sale of these plants will be applied, by order of his Grace the Duke of Northumberland, are requested to apply to Mr. WILLIAM BRAILSFORD, 21, Regent-street, London, giving their exact addresses, and stating by what conveyance the plants are to be transmitted from the station at Harlow, on the Cambridge line of the Eastern Counties Railway, where they will be delivered without further charge. It is requested that Post-office orders may be made payable to Mr. WILLIAM BRAILSFORD, who, upon their receipt, will return an order upon Mr. RIVERS for the transmission of the plants.

Applications will be complied with in the *exact order* in which they are received, and due notice will be given when the five guinea and four guinea plants are exhausted.

May we be permitted to express a hope, that although no pecuniary profit can be derived by nurserymen from a sale whose proceeds go to a charitable use, yet that they will, nevertheless, endeavour to make known, within the circle of their customers, the terms on which the Stanwick Nectarine may now be procured.

VERBENAS.—A Set of Twelve of the most extraordinary Seedling Verbenas ever offered. As a proof of their excellence, they have been awarded 30 first-class certificates; three of them will be figured in the "Gardener's Magazine of Botany," April 1. G. S. begs to say that they are very distinct, and far surpass any previously raised. The set in strong plants, the third week in April, at 21., or 5s. per plant. For descriptions, see Catalogue, which will be forwarded on the receipt of one postage stamp, with the description of the beautiful Fuchsia Sedonia, figured in the "Gardener's Magazine of Botany," for March. Also his new Petunias and Heliotropes. Selections, with prices of Verbenas, Fuchsias, Dahlias, Chrysanthemums, Geraniums, &c., at moderate prices.—GEORGE SMITH, Tollington Nursery, Hornsey-road, Islington, London.

THE "BLACK BARBAROSSA" GRAPE.

JOHN BUTCHER begs to call the attention of Grape Growers to the above truly valuable late Grape, introduced from the Continent by C. S. Ward, Esq., and was exhibited at the Horticultural Society's Rooms, Regent-street, London, in January, 1849, for which a Certificate was granted; and again on the 19th February, 1850, when a Banksian Medal was awarded it. In the Covent Garden Market Report of 9th March, it is stated that "Hothouse Grapes, excepting the Barbarossa, are over."

It has the following good properties:—The Vine a most luxuriant grower, a free bearer, largely and finely shouldered; berries large and globular, flavour equal to the Hamburgh, will hang on the Vine for at least another month to come without sinking in size of berry or losing in flavour; as hardy as the Hamburgh; the average weight of the bunches 4 lbs. each. To those families requiring late Grapes it will prove a valuable acquisition.—Good plants, from eyes, 10s. 6d. each, including package. London Agent—Mr. FREDERICK WARNER, Seed Merchant, 28, Cornhill, London. May be had of JOHN BUTCHER, Nurseryman, Stratford-on-Avon.

Also Butcher's Hybrid Black Spine Cucumber; length from 18 to 30 inches, exhibited at the Royal Botanic Garden, Regent's-park, 1846, for which a Certificate was granted. 1s. per paper.

Butcher's Shakspeare Cabbage, an early splendid variety, 1s. per paper.

Butcher's Early Warwickshire, do., 1s. per paper.

Golden Cos Lettuce, true, undoubtedly the best Lettuce grown. 1s. per paper.

A remittance must accompany the order, either in cash or penny postage stamps, from unknown correspondents.

SUPERIOR GARDEN SEEDS, CARRIAGE FREE.
(All of home growth.)

KITCHEN-GARDEN SEEDS, including all the New Sorts yet introduced, as advertised in previous Numbers of the *Gardeners' Chronicle*; and FLOWER SEEDS as under:—

| | |
|---|---|
| The best sorts of imported Asters, Zinnias, Stocks, Larkspurs, Marigolds, Phloxes, &c., in complete collections for a large garden ... ... ... ... | £1 1 0 |
| Ditto, in smaller quantities... ... ... ... ... | 0 10 6 |
| Ditto, for a small garden ... ... ... ... ... | 0 7 6 |

Instructions for Cultivation will accompany the Flower Seeds.
JOHN SUTTON and SONS, Reading, Berks.

CUCUMBER "PHENOMENA," AND "BROMHAM HALL" MELON.

EDWARD TILEY wishes to inform the Nobility, Clergy, Gentry, and Growers in general, that he has still a Stock of good sound Seeds of the above superb CUCUMBER and MELON, and other varieties, as advertised by him in the *Gardeners' Chronicle* Feb. 22d, 1851. Cucumber Phenomena, 2s. 6d. per packet; Bromham Hall Melon, 1s 6d. ditto; Fleming's Trentham Hybrid Melon, 1s. ditto; and about 20 other good varieties of Cucumbers and Melons, at the prices mentioned in the former Advertisement.

Any quantity will be sent postage free on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 12, Abbey Churchyard, Bath.

TO POTATO AND CUCUMBER GROWERS.

JAMES LAKE, NURSERYMAN, &c., Bridgewater, Somerset, begs to inform the Public that he is now ready to send out his Seedling FIFTY-FOLD KIDNEY POTATO, which has been proved and highly recommended by Dr. Lindley, Messrs. Beck and Henderson, Hurst and M'Mullen, and many others. Price 4s. per peck.

London Agent: Hurst and M'Mullen, 6, Leadenhall-street.

J. L. having grown from 15 to 20 lights of Aban's Conqueror of the West CUCUMBER successfully for three years, can with confidence recommend it to the Public as being one of the best kinds in cultivation. Packets containing 12 seeds, 1s. each.

IMPROVED GIANT ASPARAGUS ROOTS.—Fine Roots may be had of FREDERICK WARNER, Seedsman, 28, Cornhill, at 5s. per 100, with printed particulars for planting. Also the following:—Myatt's Prince Albert Rhubarb, 1s. per root; Myatt's New Victoria Pine-Apple-flavoured Rhubarb, 9d. per root; Myatt's New Linnæus Rhubarb, earliest in cultivation, 1s. 6d. each; Mitchell's Royal Albert Rhubarb, 1s. 6d. each. Fine Seakale Plants, 8s. per 100. Strawberry Plants, all the New Varieties, &c. &c.

GRASS SEEDS.

FINEST LAWN GRASS SEEDS, perfectly free from weeds and coarse Grasses, per bushel, 21s.; or 3s. per gallon (with instructions.)

Also PERMANENT PASTURE GRASSES mixed expressly to suit the soil at 28s. per acre, and all other Agricultural Seeds of home growth at low prices, carriage free.

*As see Messrs. Sutton's Priced List in last Page of the Gardeners' Chronicle of March 1.*

| FLORISTS' FLOWERS. | £. | s. | d. |
|---|---|---|---|
| 25 pairs of Carnations, in 25 varieties ... ... | 1 | 0 | 0 |
| 25 pairs of Picotees do. ... ... | 1 | 0 | 0 |
| 25 pairs of Pinks do. ... ... | 0 | 8 | 0 |
| 25 Pansies do. ... ... | 0 | 12 | 0 |

Packing, Hamper, &c., included.

JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester having a large stock of the above FLORISTS' FLOWERS, begs to offer fine show varieties, in strong well-rooted plants, at the above low prices. Priced Catalogues may be obtained by inclosing a postage stamp.

A large collection of Auriculas, Alpines, Polyanthuses, &c.

Post-office orders to be made payable at Middleton, near Manchester.

NURSERY CATALOGUES.—The following priced Catalogues may be obtained from the Cheshunt Nurseries, free by post, on receipt of one postage stamp.

A. Descriptive Catalogue of Roses.
B. Catalogue of Hardy Ornamental Trees and Shrubs.
C. ,, Fruit Trees.
D. ,, Hardy Herbaceous Plants.
E. ,, Forest Trees.
F. ,, Greenhouse Plants, &c.
G. ,, Agricultural, Garden, and Flower Seeds.

N.B.—The prices are attached to every article. All packages delivered free of carriage to London.

ADAM PAUL and SON, Nurseries, Cheshunt, Herts.

THE CALIFORNIAN HORSE-CHESTNUT (Pavia Californica).—A few fine young trees of this rare Chestnut, collected by Mr. Hartweg for the Horticultural Societies, and described as blooming with long fragrant spikes of flowers, are offered at 21s. each. They are budded on 4 feet stems of the common Horse Chestnut, and are 6 feet or more in height.

CRIMSON BOURSAULT ROSES for pillars. A few dozen of this fine pillar Rose, six years old, with from 15 to 20 shoots 6 feet long, well calculated to form rows or avenues at once, are offered at 18s. per dozen.

THOMAS RIVERS, The Nurseries, Sawbridgeworth, Herts.

VALUABLE VEGETABLES.—CAULIFLOWERS.—Myatt's improved early, much earlier than the old varieties, more compact and heavier, considered by the raiser as most desirable, quantity very limited, 1s packets.

BRUSSELS SPROUTS, improved variety, direct from Brussels; 1s. per oz. 6d. per packet.

CABBAGE, MITCHELL'S ENFIELD.—This has been tried at the Horticultural Society's Garden, and pronounced one of the best; 1s per oz, 6d. per packet.

CABBAGE CHAPPEL'S COLEWORT, excellent for Winter Greens; 6d. per oz.

CARROT, ST. JAMES', one of the best for small gardens, and shallow or heavy soils; 3d per oz.

CELERY, COLES' SUPERB RED, very extensively grown last season, and pronounced first-rate; 1s. per oz., 6d. per packet.

LETTUCE, VICTORIA CABBAGE, but little known, but one of the handsomest grown, and which no gentleman's garden should be without.

DUNCAN HAIRS, in offering the above selection from his general List, begs to inform his friends that he warrants them to be as described.

109, St. Martin's-lane, Charing-cross, London.

NEW VALUABLE FLOWER SEEDS.—Portulaca novarogea, new Rose var., very handsome, 1s. per pkt.

| | | |
|---|---|---|
| Ipomœa Quamoclit alba, half-hardy ... ... | 1s. | ,, |
| ,, Burridgii, splendid hardy ... ... | 6d. | ,, |
| Saponaria Calabrica, var. multiflora ... ... | 6d. | ,, |

No garden should be without this most valuable Annual.

| | | |
|---|---|---|
| Martynia angularis, new and handsome ... | 6d. | ,, |
| Gloxinia, hybridised by a first-rate grower ... | 1s. | ,, |
| Calendrinia umbellata, new and handsome half-hardy Annual ... ... ... ... | 1s. | ,, |
| A few packets of Lisianthus Russellianus ... | 1s. | ,, |
| Tropæolum speciosum, very handsome ... | 1s. | ,, |

DUNCAN HAIRS' object, in selecting the above few Seeds from his collection, is to draw the particular attention of those who are fond of novelty and beauty. Amongst other departments of his business, D. H. prides himself on having some first rate Seeds of Florist Flowers—viz., Calceolaria, Cineraria, Heartsease, Dahlia, Verbena, Carnations, Pink, Cockscombs, and Balsams, &c., in 6d and 1s. packets.

German Stocks and Asters in collections, 2s. to 5s.

109, St. Martin's-lane, Charing Cross, London.

Catalogues per post free.

BEAUTIFUL HARDY CYPRESS, CUPRESSUS GOVENIANA.

ADAM PAUL AND SON beg to offer handsome Seedling Plants of the above new CALIFORNIAN CYPRESS. Well feathered to the base, 1 to 2 feet, 10s. 6d. each; 2 to 3 feet, 15s. each. Package 1s. extra, carriage free to London.

N.B. A large stock of Cedar of Lebanon, Cedrus Deodara, Abies morinda, and Pinus excelsa, handsome seedling Plants, 1, 2, 3 4 and 5 feet high, prices moderate, and furnished on application.—Nurseries, Cheshunt, Herts. March 8.

NEW DAHLIAS, &c. &c.

THOMAS BARNES begs most respectfully to announce that his Spring Catalogue, with description of all the leading novelties for the season, is now ready, and may be had on application.

DANECROFT NURSERIES, Stowmarket, Suffolk.

**The Gardeners' Chronicle.**

WE perceive that the success which has attended the cultivation of the Victoria WATER LILY, at Chatsworth and at Syon, has excited a general desire to follow the example. But as glass-houses of such a magnitude as a plant of the Victoria requires, are much beyond the means of the great majority of the public, the question has been raised whether it and similar aquatics cannot be obtained in open ponds.

The probability of tropical water-plants being cultivable in open ponds, strikes us as precisely equal to that of tropical shrubs being willing to grow in open fields. In neither case can success be anticipated, for this simple reason, that in all plants whatsoever vitality can only exist in the presence of a peculiar temperature—high in tropical productions, low in those from temperate and rigorous climates. This peculiarity is part and parcel of their nature; they cannot lay it aside; they cannot modify it at will, but they stand alike helpless and motionless to abide by the temperature in which accident places them; if high enough they flourish, if too low they are paralysed, become victims of gangrene, and perish limb by limb.

This is so notoriously the case with plants in general that we cannot imagine water plants to form an exception; the reverse may rather be anticipated, considering their highly cellular and delicate fabric, the rapidity of their growth, and the excess of vital power which the latter circumstance seems to indicate. Nor is it the mere temperature of the air or earth which governs water plants; plunged as they are almost wholly below the surface of water, it is indispensable that this fluid should also have a temperature constantly high enough to maintain an active growth. In the hot countries to which tropical aquatics belong, this is always the case; in the climate of England, never. Out of considerations of this kind has arisen the well-known rule of cultivation, that the water in which stove aquatics are planted should stand as nearly as possible at 84° while they are growing. The water in our open ponds cannot average more than 50°.

But while these statements are true in general, it must be admitted that startling exceptions present themselves here and there. For instance, Richardia æthiopica, a Cape plant, will certainly grow vigourously in some places, although merely plunged in the bottom of a pond; and in like manner the beautiful Aponogeton distachyum, from the same country, grows with more than its native vigour in the open pond at Edinburgh and in South Devon. Of these cases we can only say that we are little acquainted with the circumstances under which they are found wild; and that when they do succeed here it is probably in connection with the presence of springs having a higher temperature than that of the surrounding water. We have never ourselves been able to keep Richardia alive in the warmest ditch, although we have seen it in the greatest beauty in a pond at Cheshunt; and the Rev. CHARLES OSMOND, who had hundreds of flowers open last February, informs us that the place where Aponogeton grows is fed by a spring, that the water rarely freezes, and is always clear. We understand, however, that it thrives as well in many Cornish ponds, to which it has been introduced by Sir CHARLES LEMON.

Why then should not Nelumbium speciosum grow likewise? The question was raised in the "Botanical Magazine" many years ago, how this plant could be tender in England, and hardy at Pekin, where the rivers are said to carry waggons on their backs. To this it may seem that there are but two solutions. Either that the plant is not tender (at a due depth) in England; or else, that some other plant, not that, flourishes at Pekin. But we have no reason whatever to suppose that the Nelumbium of Pekin is distinct, if different, from that of the Italian Water-tanks; nor on the other hand is there the smallest evidence that it will grow in the open air in England, although our rivers will not carry waggons on their backs. And here again, we presume that a solution of the enigma is to be found in temperature—not that of winter, but of summer. It is well known that many plants will endure an extraordinarily rigorous winter, if they have passed through a summer of equal fierceness; but that, nevertheless, these hardy species perish in the equable climates of such countries as England and Ireland. That we take it is the case of Nelumbium. MEYEN observed that the temperature of water in the Paddy grounds of China was 113°; and the black sides of the boat that conveyed him stood at 142 50°. When we obtain a long succession of summer weather like this we may hope to see Nelumbiums and Victorias and tropical Nymphæas helping the Nuphars, and Menyanths, and flowering Rush, to decorate our garden ponds; but we greatly fear, not till then. At the same time we admit that experiments will probably teach us more than we anticipate; and to experiments we would therefore confine this interesting question for the present.

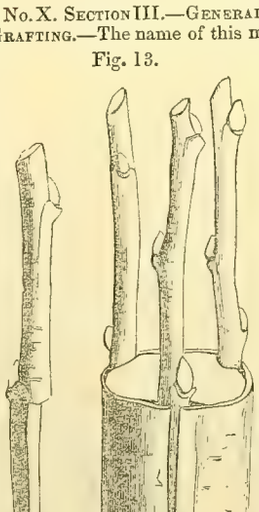
THE experiments of M. VILLE, to which we drew attention five weeks ago, (p. 52) have led to the publication of other researches on the same subject, and we to-day give an abstract of a paper in the *Comptes Rendus*, by MM. CLOEZ and GRATIOLET, on various matters connected with the theory of vegetation, and especially on the direct absorption of nitrogen by plants. These experiments are confessedly in an incomplete state, and the authors are only induced to publish their results at once, in consequence of the recent memoir of M. VILLE. As these gentlemen do little more than state the general conclusions to which they have arrived, and give very little experimental evidence, it would perhaps be premature in us to pronounce any very decided opinion on the accuracy of their conclusions; there are, however, several parts of the memoir which we may at once notice, reserving some other observations till the whole paper, and the full account of the experiments on which these conclusions are founded, is published.

It appears to be the fashion at the present time, in writing an experimental essay on the growth of plants, to commence by stating a number of well-known facts, as if they were newly-discovered phenomena, which the reader had to receive on the simple authority of the author; and, therefore, not

to be quite out of the fashion, MM. CLOEZ and GRATIOLET commence by informing us, with a good deal of ceremony, as one of the conclusions they have arrived at, that plants evolve abundance of oxygen in the sunshine, very little in diffused daylight, and none whatever in the dark; facts which were pretty well known and acknowledged before the breaking out of the first French Revolution. They then go on to state that plants never give out carbonic acid in the dark, in which they revive the favourite belief of SENEBIER. When INGENHOUSZ, somewhere about the year 1782, following in the footsteps of PRIESTLEY, published the results of his experiments, and deduced from them the general conclusion, that in the day-time plants give out oxygen, and that in the night they exhale carbonic acid or fixed air; in the day-time improving the atmosphere, and in the night deteriorating it, by the emission of a poisonous gas; he was loudly assailed by SENEBIER and many others, who accused him of inventing a foul calumny on plants, and of endeavouring to detract from the completeness and perfection of the whole creation! They repeated his experiments, but without success, for they could not observe that any carbonic acid was given out by healthy plants during the night; and hence they came to the conclusion, that the carbonic acid evolved in his experiments was the result of fermentation or disease in the plants. To all this INGENHOUSZ replied with a good deal of warmth; he repeated and confirmed his experiments, and denied that he had in any way calumniated Nature. "I have merely stated what is true," said he, "and if it is true that during the night plants evolve a small portion of carbonic acid gas, surely it is no more calumny to say so, than it is to assert that there are such things as venomous snakes, mad dogs, or arsenic, in the world."

The question thus raised, was, however, not satisfactorily settled, and subsequent writers and experimenters adopted alternately the views of INGENHOUSZ and of SENEBIER; gradually the opinion of SENEBIER gained ground, and at last, when the careful and minute experiments of PEPYS were published, the matter was decided; he found that healthy leaves do not evolve carbonic acid during the night. The present experiments of CLOEZ and GRATIOLET merely confirm that which Mr. PEPYS had already proved.

We pass over for the present altogether the experiments on the influence of temperature; they too do not seem to possess much novelty, though they are probably valuable and trustworthy results. The third series of experiments, those on the influence of the surrounding medium, is that most nearly connected with the experiments of M. VILLE, and the great question of the direct absorption of nitrogen by plants. It is of course impossible to judge correctly of the real value of these experiments, until we know the kind of plants with which they were made; but as far as the preliminary statement goes, it is certainly by no means altogether satisfactory; and the remarks we made when speaking of M. VILLE's results, may with equal propriety be applied to these. We have very little faith in experiments made with land plants, plunged under water, and therefore placed in a most unnatural situation; and on the other hand, it is a very questionable thing to examine the growth of a water plant growing wholly in water, and then assume that land plants growing wholly in the air must feed precisely in the same way. We are told that the plants grew well in river water, which contained common air, and therefore free nitrogen, provided the water was renewed every day, but that they soon became unhealthy if they were kept in water which did not contain air; now if this be true, it may be caused in various ways, and may be quite independent of the assimilation of nitrogen.



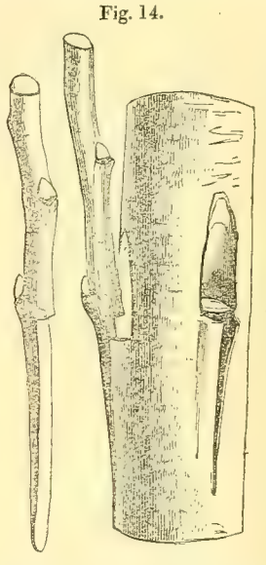
It is stated by M. CLOEZ and GRATIOLET that when a plant is plunged in pure water, which contains nothing but a small portion of carbonic acid, at first it appears remarkably healthy, and abundance of oxygen is evolved, which is contaminated with nitrogen; that after a time the oxygen comes off in less quantity, but is then nearly pure; after which the plant begins to suffer. Now setting aside the very unnatural circumstances in which the plant is thus placed, we do not see how, from such an experiment, it is possible to conclude that the nitrogen which contaminates the first portions of oxygen is produced by the decomposition of the plant itself, that a fresh supply of free nitrogen is necessary to supply this waste, and that the plant suffers because it loses nitrogen on the one hand, and none is supplied to it on the other to counterbalance that loss! We think that if the nitrogen which is at first given off really arises from the decomposition of the plant, it only shows that the conditions of the experiment are so entirely forced and unnatural, that no satisfactory conclusions whatever can be drawn from it. But in truth there is no need to assume that the nitrogen has any such source; at the commencement of the experiment, the plant, it is to be supposed, was in a tolerably healthy state; and if it was, it would naturally contain a considerable bulk of atmospheric air, as most plants do, and this air would be gradually given out, along with the oxygen evolved by the plant, under the influence of the sun's light. Hence the first portions of oxygen would contain a small quantity of nitrogen; but, as there could only be a limited quantity of air in the vessels of the plant, and as it could not absorb any more under the peculiar conditions of the experiment, the oxygen would soon be given off in a nearly pure state; when this was the case, the tissues of the plant, instead of being charged with atmospheric air, would be saturated with nearly pure oxygen, and a fresh unnatural condition would be added. Chemical action would then begin to get the upper hand over the vital powers of the plant, and it would unquestionably soon become unhealthy. The effects observed in this experiment might be explained in other ways, and there does not seem any sufficient reason to assume that plants are subject to this continual waste of nitrogen, which, in fact, might be compared to the respiration of animals. As far as we are yet able to judge, the experiments do not warrant such a conclusion.

The general result, deduced from similar experiments, in which various solutions of ammonia and ammoniacal salts were employed, is, in the same way, by no means satisfactory; and, as a generalisation, could not be admitted. It is stated that water plants are able to obtain the nitrogen which they require from atmospheric air, but not from ammonia. It is quite certain that this does not hold good with common land plants, on the growth of all of which ammonia exerts a most beneficial influence, increasing the formation of vegetable matter, and not merely rendering them richer in nitrogen, but, at the same time, by making them more healthy and vigorous, enabling them to absorb a larger quantity of carbon also from the air. Until all the details of these experiments therefore are published, we cannot but feel rather sceptical as to the results; we doubt whether the authors, any more than M. VILLE, have established on good evidence, and by clear and distinct experiments, the assertion that plants are able to absorb and assimilate the free uncombined nitrogen of the atmosphere.

## GRAFTING.

No. X. SECTION III.—GENERAL OBSERVATIONS ON CROWN GRAFTING.—The name of this mode of grafting indicates sufficiently the manner in which it is usually applied (see Fig. 13), but it is not unique, as will be seen. It is adapted for the regrafting of large old Pear and Apple trees* of bad sorts, or others that are too numerous, or that are placed in situations unfavourable for the variety of fruit which they bear. The stocks ought to be treated in February as the strong trees destined for being cleft-grafted are at that period. It does not make old trees young, as has been stated by many authors; but it gives them a somewhat youthful appearance by the renewal of their branches. It is an advantageous substitute for the lopping in of good sorts, for the shoots from grafts are more proper for training than those are which spring naturally through the old bark.

Fig. 13.



We can know the proper time by the movement of the sap in some reserved shoots, as in the case of cleft grafting; besides this inspection, we may assure ourselves by ascertaining whether the bark of the stock is easily detached from the alburnum, and if so, we proceed with the operation as follows.

Before amputating afresh the branch or trunk, fix upon the most suitable place for the graft, and with a saw shorten back to that point, regulating and smoothing the wound with a knife; then mark out the place for each scion, about $1\frac{2}{10}$ inch apart, always choosing those points where the bark is the most regular; but as the latter is always coarse and tough on such trees, we cut it lengthwise for about an inch in length, taking care that the blade of the grafting-knife does not penetrate the alburnum. As this instrument is frequently insufficient for raising the bark so as to make way for the scion, we make use of a small piece of hard wood, cut in the form of the scion, such as the latter is represented, *fig.* 13; and in introducing the point between the bark and alburnum, we must always be careful to bruise the latter as little as possible. In order to avoid this, the instrument should not go down farther than the end of the cut made in the bark, thus effecting merely a slight entry for the scion, which, it will be observed, is cut with a long slant, and a small shoulder at the upper part of the slope, opposite to an eye. The scion thus prepared is inserted in the opening commenced for it, and gently pushed down till its shoulder rests on the top of the stock. The operation is similar for all the other scions which the stock may require, their number depending upon its size. The whole being placed, they are secured by a split Osier firmly fixed to the stock, and brought two or three times round, and as near to the amputated part as is possible.

We may employ this mode of grafting, in some extraordinary cases, without cutting off the top of the stock, when we would wish to place one or more scions along a stem destitute of lateral branches. This, which M. Thouin has enumerated amongst the varieties of side-grafting, has received some modifications, which we shall here detail, referring, in the first place, to fig. 14. By means of a sharp chisel, three-quarters of an inch broad, make in the stock a transverse cut the whole breadth of the chisel, and about as deep as the thickness of a finger; above this, cut out with the same tool a somewhat triangular notch, of $1\frac{1}{2}$ to 2 inches in length, with its depth almost nothing at the commencement; but increasing progressively as the chisel is made to penetrate towards the bottom of the first cut, as is represented at A. The object of this notch is to stop a small portion of the ascending sap, in order that it may be absorbed by the scion. In putting on the latter, we place it as directed in the preceding case. *Translated from the French of D'Albret.*

Fig. 14.

* Stone-fruit trees cannot be grafted by this proceeding, because their bark will not rise at the time.

## RESEARCHES ON VEGETATION.

(BY MM. CLOEZ AND GRATIOLET.)

ALTHOUGH we have been occupied in researches on vegetation for upwards of three years, we refrained from publishing our results, until they should have attained the greatest degree of accuracy and extent of which they were susceptible. The late publication of M. Ville compels us, however, to make them known, and to state that we have been endeavouring to solve the same question as this gentleman, although by a different method. Our experiments were made in M. Chevreul's laboratory, in the Museum of Natural History, and under his auspices. Our principal conclusions have been laid before M. Decaisne, and have been, to a certain extent, already made public, as they were incorporated by M. Frémy in the lectures given by him at the Museum last spring.

We do not intend to state in this place the details of our experiments; they will be explained at length in a work which we are preparing for the press; we merely lay before the academy such of our results as seem to us to be certain and correct.

It has long been known that the green part of plants decomposes carbonic acid gas, and separates the oxygen from it. This process is performed with great rapidity, by submerged aquatic plants, and they separate more oxygen in a given time than most other plants. This fact induced us to select for our experiments different species of *Potamogeton*, *Ceratophyllum*, *Myriophyllum*, and *Conferva*.

Our conclusions may be stated thus:

1. *Influence of Light.*—Oxygen is disengaged rapidly in solar light, insensibly in diffused light, and not at all in darkness. In the latter case, no carbonic acid whatever is given off by plants; the contrary is generally supposed.

We endeavoured to discover the comparative influence of coloured glass on the decomposition of carbonic acid by the green parts of plants; as well as we could ascertain decomposition is most rapid under colourless, unpolished glass, then comes yellow glass, then colourless transparent glass, then red, green, and lastly, blue glass. We satisfied ourselves that these differences were not caused by differences of temperature.

2. *Influence of Temperature.*—The decomposition of carbonic acid gas by aquatic plants exposed to light in a temperature raised gradually from 39·2° F. does not commence until the temperature is 59° F., and is at its maximum at 86° F. The decomposition of the same gas by plants exposed to light in a temperature which

is lowered from 86° F., continues when the temperature is as low as 57·2°, 55·4°, 53·6°, 51·8°, but ceases when it is as low as 50° F.

These results are in every way conformable to those arrived at by M. Chevreul, from his observations on the circulation and ascension of the sap in plants. ("Journal des Savants;" May, 1822, p. 302.)

3. *Influence of the surrounding medium*—Vegetation of submerged plants can continue for several months in Seine water aerated and renewed every day. In river water deprived of air by boiling, and containing nothing but carbonic acid in the same proportion as Seine water, and also renewed every day, decomposition is at first very active, but soon grows less so, and ceases entirely at the end of 4 or 5 days. After this time the green colour of the plants is singularly reduced in intensity.

The phases of this phenomenon are very remarkable. First of all, the gas wnich is produced is mixed with a certain quantity of nitrogen, which diminishes little by little, so that the last portions of disengaged oxygen are nearly pure. The total quantity of nitrogen disengaged is much more considerable than the volume of the plant; and, if the plant be analysed, it will be found that, taking equal weights, it contains less nitrogen than another portion of the same plant not submitted to the experiment. These facts show that, in the vegetation of submerged plants, nitrogen is produced from the decomposition of their very elements; that a fresh supply is therefore necessary; and that nitrogen, free or combined, is an *article of food* essential to the life of an aquatic plant.

We were led by this to inquire into the influence of ammonia and its salts. We found that ammonia and its salts, dissolved in 10,000 times their weight of water, were always hurtful. The decomposition of carbonic acid diminished, and ceased at the end of a few hours. We therefore think we are justified in concluding that nitrogen, dissolved in water, is directly assimilated by the plants we operated upon.

4. *On the Movements in Plants of the absorbed or exhaled Elements.*—It is a fact, of the truth of which any person may easily satisfy himself, that in whatever position leaves of a Potamogeton may be placed in water, carbonate of lime is constantly deposited on the upper, and never on the lower surface of the leaves (upper and lower being used in their botanical sense). This seems to show that carbonic acid is essentially absorbed by the upper surface of leaves. The oxygen, which is produced by the decomposition of carbonic acid, has a perfectly defined course. It constantly descends from the leaves towards the roots. So that if a piece of Potamogeton, having a few leaves upon it, be placed horizontally in water, the oxygen is exhaled from the section nearest the root end of the plant. *Comptes Rendus.*

## MARKET GARDENING ROUND LONDON.

No. X. The Strawberry.—This most delicious and wholesome fruit is very largely cultivated for the London markets, and more fruit is even consumed in the villages surrounding the metropolis than in the largest provincial town in England. It is difficult to discover the correct acreage devoted to this kind of crop in the different counties surrounding London; but at a rough guess it may be estimated at near 100 acres.

In cultivating Strawberries the runners are generally planted out upon well prepared ground in August, but in the case of dry weather the operation is often deferred until about the 1st of September. They cannot, however, be planted out too soon; and for the British Queen the old-fashioned plan of saving the runners amongst the old plants, or what is better, pricking them out into winter beds 4 inches apart, and planting them out in March between Lettuce or some other dwarf crop answers best; any blossoms that are thrown up afterwards are picked off. Mr. Joseph Myatt, of Deptford, who has been so long justly celebrated for rearing and growing Strawberries, has kindly furnished me with the following answers to questions which I put to him respecting this fruit.

*Q.* What number of acres have you under Strawberries?

*A.* Seven.

*Q.* What sort of soil and manure do you use, and how much?

*A.* Sandy loam, horse and cow-dung, mixed, and applied at the rate of 30 loads to an acre.

*Q.* How many years do you allow the plants to bear?

*A.* Two, but if the sorts are very productive, three.

*Q.* What distance apart do you plant?

*A.* My beds contain three rows of plants, which stand 18 inches apart each way, leaving 2½ feet alleys, and clearing out the middle row after the fruit is picked off the first year.

*Q.* At what time do you straw them?

*A.* As soon as the first fruits are set.

*Q.* Do you use any water?

*A.* I have none within a mile of me, or I would employ it.

*Q.* What regulations are observed in the picking season?

*A.* The best fruits are put into 1 lb. punnets; the "seconds" into pottles; the pottles and punnets are made up professionally.

*Q.* Do you approve of sending them to market in the 4 or 5 lbs. wicker baskets, which are used by some growers?

*A.* This plan is only fit for hard ones, and Strawberries for preserving.

*Q.* How do you transmit your fruit to market?

*A.* To the latter by means of a spring-van; to shops, on women's heads.

*Q.* What sorts do you grow?

*A.* British Queen, Eleanor, Deptford Pine, Comte de Paris, Surprise, Goliah, Keens' Seedling, and many other seedlings.

Such are the answers of one of the best cultivators we have round London. Having no water near him, Mr. Myatt depends entirely upon the immense quantity and quality of his manure for keeping the ground moist, together with a good coat of straw; but where manure is scarce, perhaps my plan, which I have practised for many years, would be the best. I always mulch between the rows with fresh straw, mixed with horse droppings, laying it on at least an inch in thickness, just when the plants are coming into flower; and if the weather is dry I water frequently, but not over the flowers, until all the fruit is set. By the time the latter is ripe, the strength of the manure is washed down amongst the roots when they most want it, leaving the straw clean and sweet. Some market gardeners plant the British Queen 2 feet 6 inches apart between the rows, and 18 inches plant from plant. By this means large fruit is obtained; and should the autumn prove so dry as to ripen and set the buds properly, the crop in the following year is very heavy. Keens' Seedling does not require such treatment; if it is planted out in July or August it makes fine plants, and bears a heavy crop the first year, but the plantation must consist of runners from plants that have produced a good crop. And the safest plan is to go over them when they are coming into flower, and before they are mulched, in order to pull up any plants that are unproductive. In some years, acres are destroyed, on account of their not bearing fruit. This happens after a wet autumn, which causes the plants to grow into leaf without forming flower buds, and this occurs oftenest on light land. In the Strawberry season, market gardeners provide themselves with thousands of pottles, called quarts. These are formed of white Fir, or laths split up very thinly. The length of the London pottle is 11 inches. The inside diameter at the bottom is an inch, but it gradually enlarges until it is 3½ inches wide at the top, which is finished with a handle rising about 4 inches above the rim. This pottle properly filled with fruit ought to weigh from 12 to 14 ounces. For the first early Strawberries, what are called pint pottles are used. These are the same size at the bottom as those just mentioned; but they are only 7 inches long, and not quite 3½ inches in diameter at the top, finishing with a handle 2 inches high. They hold, when filled, about from 4 to 6 ounces of fruit. "Punnets" are made of the same material as the pottles. They hold ½ lb., 1 lb., 2 lbs. and upwards, according to the purposes for which they are wanted.

Considerable skill is exercised in what is termed, "topping up of a pottle," so as to give to its top the form of a cone. The first row of fruit sits partly on the rim, and exhibits its best broad side half way round the pottle. The next row occupies the bosom of the last, and so on to the top. The other side of the pottle is then "put up" in the same way, and when well done, the fruit is not easily displaced, the pottles are then sent off to market in light spring vans, which hold two tiers of light white wicker baskets; the latter contain 36 pottles, but in the case of the best fruit these baskets are divided by first putting in a layer of 1 lb. punnets, and then a division, filling up with punnets. The supply for the shops is conveyed to them by Welsh or Irish women, who carry them on their heads; these women being paid for every journey they make, earn a good deal of money at this occupation, in which they often walk 48 miles a day, *i. e.*, three times, say, from Isleworth, and three times back. This is, however, hard work, which I hope some day to see performed by the cheap steam-boats which now ply so plentifully up and down the Thames.

Market-gardeners exercise much ingenuity, in order to secure early fruit, such as planting closely in beds, and placing frames over them early in the spring; taking up plants with good balls and putting them into frames, in a little bottom heat; as well as planting at the foot of old walls, &c. They have also tried all sorts of ways to forward the ripening out of doors, as well as to keep the fruit clean, without encouraging insects. Among the materials used for this purpose may be mentioned slates, tiles, flints, boards, &c.; but the great fault of all these is, that they breed and harbour insects, whilst they cook the fruit before it is ripe, rendering it spongy and acid. All those contrivances have been abandoned, in order to give place to the much more sensible and economical plan of mulching with litter, which answers every purpose for which it is intended perfectly.

For private growers, terraces faced with burrs, as recommended in the *Chronicle* for last year, would, I have no doubt, be found everything that could be desired. By planting close behind the burrs, the latter running east and west, the fruit would hang over the burr without touching it, and so circumstanced would experience all the benefit arising from the reflection of the sun's rays, and would ripen much earlier than it otherwise would do, in addition to which the free play of air round it would give it a very superior flavour. This plan reminds me of our native banks, where the Strawberry grows wild, and from which such high flavoured fruit is obtained, especially where the situation faces the sun. In small places within the sight of windows such Strawberry terraces would not only be useful but might be made very ornamental and agreeable to look at. *James Cuthill, Camberwell.*

## BRITISH SONG BIRDS.

(Cage Birds, No. 4.)

No. XX.—When a bird is about two years old, he is considered "steady" (if he has been carefully educated), and may be allowed to hang in the company of any others—however loud they may be. Each successive year tends to his improvement; for, if he be at all given to imitation, he will copy no notes but such as are sweet, and essentially musical. No better tutor could be found to instruct young canaries, than a staunch bird in his second or third year. They very quickly forget, in the sweet strains of his melodious voice, the "gibberish" they have learnt, while keeping promiscuous, and "loose" company, elsewhere. Always let them be much together, if you value a fine songster. When you really do become possessed of a rare bird, make much of him. Such are not to be met with every day.

I have, before, given sufficient reasons for not allowing any of your birds to see each other. Only let them *hear* each other, and you will have unceasing music from "morn till dewy eve." Such is the rivalry among birds that, not unfrequently, the one that is "outdone" falls lifeless from his perch. His heart has been broken, from the magnitude of his efforts to stand his ground! In some cases, if death does not ensue from over exertion, the bird's *spirit* (courage) will have fled for ever. He may "exist" for years; but he will never be heard to "sing," from that day forward. Of this, I have had oft-repeated proofs.

In this variable climate, you must take special care never to leave your birds in a cold room, or in a room without a fire. Keep them at one equable warmth, and they will thrive—neglect them in this matter, and their feathers will become ruffled; their head will find its way behind their wing; and their dissolution will be speedy. In an aviary, this precaution is unnecessary. No birds "winter" better in an aviary, than canaries; but this is owing to their *never* being used to a fire, and also, to their being gradually inured to the succession of the seasons.

The "habits" of the canary are no less remarkable than they are diverting, and his natural disposition is truly amiable. He bears no malice—entertains no resentments that cannot be coaxed away by a single Hemp seed. "*Semper idem*," is his family motto; and it is well chosen. He is never so happy as when he is in your company, and he will chatter to you by the hour together. It is no punishment for him to be in his cage; though he loves occasionally to hop on the table, and help himself to a morsel of sweet cake. He is of all birds the least shy, and the least suspicious—so thoroughly does he confide in the good-faith of his master and mistress. Would that such confidence were never misplaced! If you feel inclined to humour him in his little visits to you on the table, provide him regularly every morning with a square china bath, half filled with water; first placing it within a deep wash-hand basin, to prevent damage to your furniture by his splashing. An "invite" of this nature is irresistible, and he will soon be seen immersed to his very throat. On his return from the bath, his appearance will be found ludicrously comic. His sly look of self-satisfaction, and assumption of importance, whilst nearly drenched, and in a state of utter helplessness withal—are "as good as a play." Touch him, if you dare! With extended wings, and unrestrained fury, he will resent the indignity by pecking fiercely at you with his open beak, and he will often give you, in addition, "striking" proofs of his anger. These "airs of state" are very frequently practised. I merely throw out a "hint" for my readers to improve upon; for you may teach these "Majestic" birds *anything*.

In my early days, I was never without the company of some half-dozen canaries. They were allowed free liberty during the day, and they would fly after me from room to room all over the house, perching on my head or shoulder with the familiarity of a pet child. While making my toilet—a grand "study" with a gay young man—one or other of these little fellows would sit on my forehead, and seeing himself reflected in the glass, he would incontinently dance a hornpipe there—his little throat the while distended with song, and his trembling wings describing the arc of a circle.

How often, too, have I taken up a book to read, and found one of my little friends speedily perched on the summit thereof, bidding me defiance to say him "Nay!" All my remonstrances have been silenced by a flood of harmony, and in every instance I have "gone to the wall."

Were I to go on thus leisurely particularising the many little tricks I have witnessed, as practised by my winged minstrels, I should exceed the bounds of propriety. *One*, however, of our joint performances, I must, through favour, record; enforcing, at the same time, the necessity for extreme care, on all who may hereafter try the experiment. It is not quite free from danger. Aware of the perfect understanding existing beween myself and little family, I was in the constant habit of playing them off some "practical joke," rewarding them afterwards with a Hemp-seed, by way of compromise. The sight of a Hemp-seed, therefore (of which my mules and canaries were inordinately fond), was a signal for some favour to be granted—some "game to come off." Taking up four or five duodecimo volumes of printed books, I opened each in the middle; and placing them in a line on their front edges, in a slanting position, there was formed, beneath, an avenue throughout their entire length. It was like a railway tunnel on a small scale. In this opening, I placed some

half-dozen birds, one by one, gently forcing them, in the first instance, to travel onwards, *pari passu*, until they emerged from the tunnel. As each successively made his appearance, I presented him, lovingly, with one of his favourite Hemp-seeds, as a "reward of merit." Shall I be credited when I affirm that, before I had thrice repeated this little experiment, my pupils thoroughly comprehended the *fun* of the thing? It is indeed strange, but positively true.

Day by day, I extended the range of volumes; till by degrees I had formed a complete circle round the room. Here and there I left small loop-holes, just to give the travellers a "bird's-eye view" of the surrounding neighbourhood—occasionally exhibiting the magical Hemp seed; a sight of which quickened their pace amazingly. When their journey was a *very* long and tedious one, their looks, as they pattered past the loop-holes, were most imploringly expressive. However, an encouraging "*Allons, Messieurs!*" kept them up to their work bravely. Arrived at the *terminus*, the strut of triumph, as each came forward, and claimed his reward, can only be faintly imagined. I cannot, and will not, attempt to describe it. *How* these pleasing scenes of early life linger in the memory! *William Kidd, New Road, Hammersmith.*

## Home Correspondence.

*Varieties among Conifers.*—In the classification of Coniferous plants, the recognised distinction of the three, five, and two-leaved Pines, affords a basis for grouping that genus, of which one of the chief recommendations lies in its simplicity, and the broad evident principle on which it rests. The grand demarcation of species which separates the Strobus from other Pines, applies to the general classification of Coniferæ It lies certainly within the boundary of the five-leaved Pinus, so far only as the near connections of the species can be marked by the number of leaves in a sheath; but its great value is in the higher characteristics it affords for the primary division of the genus and species of Conifers. I say thus much only to express the certain amount of value I consider to be due to the classification of Pines by the number of leaves in a sheath. There are, as your readers are aware, several exceptions to this rule—as, for instance, in the uncertain number of leaves in the sheath of Pinus mitis, and one or two others which form a connecting link between the two and three-leaved Firs, in the same way as, to a certain extent, is observable in Pinus Hartwegii, which breaks the rule by having frequently four leaves in a sheath. But there has always appeared to me a very valuable regularity in the rule which supplies that simple mode of subdivision; a regularity to which the great majority of species are obedient. Among them are the varieties of Laricio. My object in addressing you is to draw information from such of your readers as have, like myself, applied a long and exclusive attention to the cultivation of Coniferous plants—to draw information which will be both interesting and valuable. I conceive it very possible that the varieties which we cultivate may have frequently arisen from accidental causes of soil and climate, and have been perpetuated in their newly acquired characteristics by the ripening of their seeds; which, whether in the course of centuries, scattered over wide extents of surface by running streams, or owing their original existence as varieties, and their subsequent propagation, to the unconscious acts of birds and insects, have now in our time acquired such constancy in their habits, as to claim distinct places in the catalogue of their fellow species. I enclose two specimens of leaves which I picked from a Pinus austriaca in my Pinetum. The austriaca is a recognised member of the family of Laricio, and has always appeared to me to be not less easily distinguished by its two-leaved foliage, than by the form of bud, and cone, and general habit of growth; but the leaves I send you are singular exceptions to the general rule. One set of leaves was (when on the tree) bound up and twisted together like the two leaves of the plant long known as monophylla, but you will observe that they are a twist of three leaves. The other set is a bunch of three separate leaves in one sheath, not twisted together; but of a thickness, length, and vigour more common to a Pinus ponderosa than an austriaca. These are not single instances on the tree from which they are picked; some shoots are almost entirely clothed with foliage of this description. The plant is about 10 feet high, and exhibits a most remarkable vigour. I wish to know if others have ever remarked similar varieties equally well developed in this or other species? In the instance I give from my own collection, I recognise the first action of natural causes to produce varieties which, by the maturing action of time, soil, and climate, become the basis of still further modification, and supply a sphere for future examinations into the history of Coniferæ, to which I invite the attention of yourself and your readers. *Pinus Gloucesterensis.*

*Peat Charcoal.*—I have read Mr. Cuthill's remarks on Irish peat charcoal, and its effects on different vegetables, with much interest. I am resident within 10 miles of several hundreds of acres of the peat bog, varying from 3 to 15 feet in depth, and I am desirous of trying to manufacture this valuable fertiliser. If, therefore, you or any of your intelligent correspondents will favour me with the best and most economical manner of manufacturing it from the bog I shall be much obliged. *Tyro.* [You will find some information on this subject at p. 84 of our current year's volume, and also at p. 750, 1849.]

*Bouquet Trade in New York.*—Seeing an account at p. 118, of the New York bouquet trade, and knowing that it is likely to make a false impression on young gardeners, who may be led to believe from it that the nursery trade is in a flourishing condition at New York, I beg to state that there are no nurseries there having any extent of greenhouses, &c., out of which such an amount of flowers as that mentioned by your correspondent could be cut, on any one day through the winter. Being in New York in the months of August and September last, I visited several nurseries there, which are queer things, when compared with our London ones. The great bulk of the plants which I saw in their greenhouses were not the sorts likely to produce flowers fit for bouquet-making on New Year's-day. I am of opinion that the principal work the six gentlemen who were "up all night" had to perform, was keeping the greenhouse fires well supplied with cord wood, in order to keep out the frost, that being at the time many degrees below zero. The sending out on one morning in the winter time 200 dollars' worth of cut flowers (41*l.* 13*s.* 4*d.*), reminds me of the tickets to see Jenny Lind's first performance, which the people here were told, through the press, were sold for from 200 dollars to 600 dollars each. No; the immortal dollar note is loved too well to be parted with, for such trifles. When the New Yorkers possess the refined taste of the people of these countries, I will believe that a New York nursery can send out 200 dollars' worth of cut flowers on a winter's day. At present, as the Yankee would say, "I guess that would be going a-head." *C. B. D.*

*Timber Trees.*—Mr. Bailey has very correctly designated a "Young Gardener's" scheme for obtaining a supply of home-grown timber an "unhappy one." One of the first operations agriculturists have to undertake when about to improve the cultivation in many districts, is to root out the hedgerow timber, because experience has shown that however much trees on farms may improve the beauty of the landscape, they are in a far greater degree injurious to the growing crops; and yet it has been proposed that farmers should be compelled to plant trees in the corners of their fields. I thought it was generally admitted that farmers had just now quite as many burthens to bear as they were able to stand under. Query: would not "young gardeners" be better employed if they devoted their attention to their own business? *Roaldus.* [Certainly.]

*Establishing a Rookery.*—A friend of mine who was anxious to possess a rookery has now a large one, from the following simple method. A magpie came in the spring and built its nest in a clump of trees. When the magpie had laid her eggs, he sent his keeper to a neighbouring rookery and got half-a-dozen eggs. The magpie hatched and reared four rooks out of the six eggs. They lived comfortably together through the autumn and winter, but in the spring a battle took place between the parties—the rooks gained the day, drove away the magpies, and have now established a large colony. *C. W. H.*

*Wireworm.*—A statement is published in your last Number respecting the destruction of the wireworm. I saw the account in the Journal of the Royal Agricultural Society some months ago, and tried an experiment by collecting some wireworms, and putting them into a pot with some lumps of Rape-cake, as directed. I looked at the pot this morning, and they are still alive. I may say that these have been potted several months; so as far as pot plants are concerned, Rape-cake is not a sure remedy. *R. C.*——I read "E. F. K.'s" communication on the destruction of wireworm with interest, as I was preparing some notes of a similar kind. I have noticed the eagerness with which this grub devours Rape-cake, and the fact may account for the usefulness of this manure as a spring dressing when the crop is endangered by the worm; but I must express a doubt whether this, its favourite food, is the death of the eater. I have found wireworms revelling in a heap of Rape-dust, apparently in a high state of enjoyment. May not the exuviæ have been mistaken by Mr. Charnock for the dead bodies of the enemy? *S. S.*

*Mildness of the Season in the North of Scotland.*—I beg to send you flowers of two Magnolias, grandiflora and conspicua, which I have gathered to-day (5th March) from trees growing against a south wall, where no protection has been afforded them during the winter. They are in an excellent healthy condition, and cover a wall about 14 feet high. I send them merely as examples of the mildness of our northern climate, this place lying about 58° North latitude. The winter has been remarkably mild here, as well as in other parts of the country; the flower-buds of grandiflora have been swelling uniformly throughout the winter; and should the weather prove no severer than it has hitherto been, they appear as if they would be fully expanded next month. Apricots have been in bloom for these 10 days past, and Peaches in the open air are also in flower. *John Webster, Gardener to the Duke of Richmond, Gordon Castle.*

*Campanula Vidalii.*—At p. 136 of the *Gardeners' Chronicle*, you have given a notice of this plant, derived, I presume, from Hooker's "Icones Plantarum," in which you state it to be "a straggling shrub, with good-sized cream-coloured flowers, said to grow two or three together at the end of a long stalk." As the figure in the "Icones" was taken from Mr. Watson's specimen, and the description also supplied by Mr. Watson, the following excerpt from a private letter of Mr. Watson's, dated Jan. 16, may not be without interest:—"Campanula Vidalii, he remarks, "was the only species brought by me from the Azores not gathered by myself. But it was brought to me in the dusk of an evening. From recollection I should say it would prove a highly desirable addition to our garden borders, if hardy enough for the ground, and worth house culture if not hardy." In a second note dated January 30, Mr. Watson remarks: "The plant is figured in Hooker's 'Icones' 684, but the figure is taken from a small specimen with *very* few flowers." Hence you will see that though Mr. Watson's materials were sufficient for botanical identification, they could convey no adequate idea of the plants under cultivation; and to condemn a plant for its appearance in a state of nature would be to consign three-fourths of the finest things in cultivation to oblivion. The person who sent the seeds to me, Mr. Peter Wallace (a pupil of Mr. Paxton's) gardener to Jose de Canto, Esq., St. Ann's, Porta Delgado, St. Michael's, thus described it upon the paper which contained the seed, "a soft-wooded spreading shrub, forming a beautiful round head, about two feet high—produces at every point a spike of beautiful white flowers. If hardy a first-rate acquisition to the borders; if not, a beautiful greenhouse shrub." In the letter which accompanied the seed, Mr. Wallace says, "The Campanula is a novelty which you may recommend with confidence." Upon the above statement of facts, which I verify by sending the original, it is unnecessary for me to offer any comment, and am quite willing to allow you and the public to draw your own conclusions. All that I desire is to justify the description I have given upon the seed papers, which I think I have done. Whatever the plant may prove, these facts are established:—first, that it is new; second, that it is distinct in habit; third, that the flowers are large; and fourth, that the plant is a shrub;—all desirable qualities in a genus so extensive as that to which this plant belongs. I have written to the Azores for plants, so that its value will soon be proved, as they will be here before the end of the coming week.—*Wm. P. Ayres, Brooklands, Blackheath* [We have omitted a quotation from Hooker's "Icones," which is immaterial to the question before us. As we have already stated, "what the plant may be worth will be seen hereafter."]

## Societies.

Horticultural, *March* 4.—J. R. Gowen, Esq., Treasurer, in the chair. Perhaps the most interesting, though by no means the most important of the subjects exhibited, were two examples of the new Sikkim Himalayan Rhododendrons, seeds of which have been so plentifully distributed among cultivators in this country. In consequence of the very beautiful representations of some of these Rhododendrons, published by Sir William Hooker, it is anticipated that many magnificent sorts will be discovered among them, and, as there appears to be considerable variety among the seedlings, both in appearance and constitution, this will in all probability be the fact; but that all will not be handsome, nor possibly even desirable, was proved by the plants shown, for the first time, on Tuesday last, by Mr. Wells, gr. to E. Hussey, Esq., Scotney Castle, Lamberhurst. These consisted of a little Alpine species with scurfy leaves, and small pale lemon-coloured flowers, which possessed a scent something like that of the buds of the Balsam Poplar. In general appearance the plants resembled the ferruginous Rhododendron of our gardens; but at present they are inferior in beauty to that species.—Mr. Cole, gr. to H. Collyer, Esq., of Dartford, exhibited a young and very healthy specimen of the pale variety of the charming Rhododendron javanicum, for which a Certificate of Merit was awarded. Mr. Cole finds that the best way of managing this fine species is to grow it quickly in the stove, until it has assumed the form of a good-sized bush; after which he thinks it will succeed in a greenhouse, treated like an Indian Azalea.—Mr. Glendinning, of the Chiswick Nursery, Turnham-green, sent a very promising greenhouse plant, in the shape of a Labichea, from Swan River. It resembled the Willow-leaved Heimia, but the flowers were larger and handsomer than those of that plant. A certificate of merit was awarded it.—Mr. Franklin, gr. to Mrs. Lawrence, produced a nice collection of Orchids, consisting of the charming Trichopilia suavis, the fragrant Burlingtonia, Gibson's Cymbid, and a curious rather than beautiful plant called Ponthieva maculata. A Banksian Medal was awarded for the Sweet Trichopil.—Mr. Loddiges, of Hackney, showed a specimen of the ivory-flowered Cymbid (Cymbidium eburneum), and the dark variety of Dendrobium nobile. A Banksian Medal was awarded for these.—A similar award was also made to Mr. Blake, gr. to J. H. Schröder, Esq., of Stratford, for the large-flowered Phalænopsis, Cœlogyne cristata, Epidendrum odoratissimum, and Skinner's Lycaste, a plant which, in addition to its great beauty, has the merit of keeping long in bloom.—The subjects from the Society's Garden consisted of Lycaste plana, and Dendrobium cucullatum; six kinds of Epacris, three of the smaller growing species of Acacia, Erica picta, the winter-flowering Styphelia tubiflora, Cytisus racemosus, a useful plant at this season, the pretty Polygala Dalmaisiana, Boronia tetrandra, Æschynanthus longiflorus, the handsomest of all the Æschynanths, and a fine bush of the broad-leaved Franciscea, than which, when well flowered, as this was, few plants look gayer.

Linnean, *March* 4.—Dr. Wallich, V.P., in the chair. A collection of specimens of dried Ferns from the north of India, made by M. P. Edgworth, Esq., was presented by the Rev. R. Ewing. Dr. Welwitsch presented the

fruits of the following plants:—Mauritia vinifera, Copernicia cerifera, and Sideroxylon argan. A paper was read on the gum called Bdellium, by B. A. R. Nicholson, Esq., of the Bombay Medical Service, and communicated by John James Bennett, Esq., Secretary of the Society. This gum, which is mentioned in scripture, and sometimes known by the name of false Myrrh, is the produce of a species of Balsamodendron. Dr. Stocks has lately traced the origin of this gum to a species called B. mukul. Specimens of the impure and purified gums were exhibited.

Stoke Newington Chrysanthemum Society, *Feb.* 27—J. Edwards, Esq., President, in the chair. At this meeting the following essays on the cultivation of this improving autumnal flower were delivered by Messrs. James and Taylor. The former described the method adopted by himself for its growth and exhibition in pots; while Mr. Taylor's observations were directed to the mode of producing those superb cut blooms which are annually exhibited at the shows of this Society. After one or two preliminary remarks, Mr. James proceeded thus:—"The cuttings should be clean, strong, and short-jointed; not suckers, but strictly speaking cuttings. As soon as a sufficient quantity can be secured, which should be effected by the middle of March or the beginning of April, proceed with the striking as quickly as possible. When properly rooted, pot them, either singly or three in a pot, as the varieties may respectively require. In my opinion, some kinds succeed best potted singly, and make finer specimens; while on the other hand, others do best three in a pot; the varieties I should advise to plant singly, would be, Pilot, Queen of England, Annie Salter, Defiance, and Vesta; of such sorts as Golden Clustered Yellow, Madame Poggi, Gipsy, Madame Camerson, and Harris's Queen Victoria, I should by all means recommend three plants to be placed in a pot. I use 5-inch pots; when thoroughly established in these, I at once shift them into the pots in which they are intended to bloom, which should either be 11 or 9-inch pots, according to the inclination or convenience of the cultivator; if smaller pots are employed, it will be found extremely difficult to maintain a healthy and vigorous foliage on the plants, and although a good head of bloom may be secured, yet I think it will be admitted that this with bad foliage is unsuitable for an exhibition table; foliage, more especially, is what I aim at, almost at the expense of bloom. The soil I use and prefer is maiden loam and dung, three parts of the former to two of the latter, with the addition of charcoal dust and coarse sand. Be particular as to drainage, or the foliage will be sure to suffer. With respect to watering, I apply water as often as is necessary, whether it be in the heat of the day or in the cool of the evening. I frequently use the syringe from the time they are potted till the time they are in bloom; its application tends much to improve the colour of the foliage, and has the additional advantage of keeping the plants clean and free from insects. I am an advocate for the use of liquid manure, and I give a decided preference to sheep manure water. It may, and I believe it is not so powerful as guano, but I consider it a much safer manure, more especially in the hands of an amateur; I also think that it has the effect of securing a neater and more compact growth, which is of importance in a specimen plant. I would advise the application of manure water from the middle of July up to the time of exhibition. Stopping the plants appears to me to be altogether wrong, although the practice is strongly recommended by many writers on gardening. I have tried it, and can speak confidently as to the result, which has invariably been a decided failure. Be particular in tying out the plants properly in every stage of their growth; you should begin at the beginning, for if the operation is neglected until the plants have attained size, it is extremely difficult to make them assume the desired shape. By tying, in addition to form, you secure the branches from accident by wind or from others causes; and it also ensures a free circulation of air among the foliage and branches. I find three sticks to each pot, placed in the form of a triangle, sufficient; through these sticks I pass three rings of wire, one at the middle, the others near the top and bottom of the plant; the advantage of this mode of tying is that it does away with the necessity of using so many sticks; and in consequence gives the plant a more natural appearance. I would recommend plunging the pots, but be sure you have a dry bottom; in such a situation the roots are kept cool without being wet; plunging has also the advantage of preventing the plants from being blown about by wind; be careful, however, not to plunge in a wet, cold, badly drained soil. The time for housing the specimens depends very much upon circumstances; as for instance the weather, the precise date on which they they may be required, &c. Housing will have the effect of slightly forwarding them; be careful not to shelter them too soon; if you do you will lose in a few days what has been the aim of a whole season to obtain, viz., good healthy foliage. The varieties suitable for specimen plants are the following:—Vesta, Annie Salter, Gipsy, Golden Clustered Yellow, Defiance, Queen of England, Madame Camerson, Pilot, Madame Poggi, The Duke, and Harris's Queen Victoria. I prefer growing two pots of each of the above sorts, which I can with confidence recommend. And now permit me to state, in conclusion, that the grand secret of Chrysanthemum growing (for I would be sorry to keep back any information that is at all calculated to enlighten you upon the subject), is time and attention. These constitute the keystone of success." An interesting and friendly discussion followed the reading of this and the succeeding paper, whose publication want of room compels us to defer until next week.

## Notices of Books.

*Passat-Staub und Blut-Regen ein grosses organisches unsichtbares Wirken und Leben in der Atmosphäre.* Von Dr. C. G. Ehrenberg. Berlin, 1849; folio, pp. 192, tab. 6.

The air we breathe is not that pure and unadulterated medium, even at a distance from the smoke and dust of civilisation, which we might at first sight be disposed to believe. Every inspiration that we make carries into our lungs, together with the proper elements which are to quicken the exhausted blood, a host of more or less gross and palpable matters, which, according to the proportion in which they are present, or their intrinsic nature, are more or less injurious to our frames; and, doubtless, in many cases, hasten their dissolution. This is notoriously the fact with respect to noxious gases, but it is possibly no less true with regard to multitudes of other matters which are carried about, by reason of their bouyancy, often for many miles before they subside. The immense quantity of matter so transported is proved by the various instances of black and coloured rains, arising from smoke or pollen, or other volatile substances, which, in some cases, must have been conveyed from a very considerable distance, and there is no doubt that myriads of the minute spores of fungi and other Cryptogams are thus diffused, to the destruction of any weak and languid organisms on which, under circumstances favourable to vegetation, they may chance to fall.

But these phenomena, though often exhibited on a great scale, are nothing in comparison of the clouds of dust carried hundreds of miles by the Sirocco and trade winds. It is to the composition of this dust, that the author, who has devoted so much time to the microscopic study of minute Algæ and Infusoria, has called attention in the magnificent work before us.

These clouds of dust, sometimes colouring the atmosphere orange or ochre, and whether accompanied by rain or otherwise, covering everything with which they come in contact with a thin red coat of almost impalpable powder, have been observed in various parts of the world. They occur frequently within the course of the trade winds, and have been observed coming in various directions from the coast of Africa, though not always under such circumstances as at Malta, Genoa, Lyons, Silesia, &c. In some instances coloured snow, as in the Tyrol, has fallen, which has evidently been due to the same cause with coloured rains. The dust in all cases is of a very similar composition, consisting of various Diatomaceæ, the flinty spicules of sponges and other zoophytes, pollen grains, fragments, in a more or less comminuted state, of Phænogams, sometimes portions of their intimate tissues, sometimes parts of their external coats, as hairs, scraps of cuticle, crystals, morsels of insects, comminuted vegetable and mineral matter, &c., and in a small porportion, spores of fungi, mostly resembling more or less those of Macrosporium. It does not appear certain that in any case the spores of moulds were present, though in some latitudes they must be wafted about in myriads. It is evident that the full investigation of this subject may throw much light upon the direction of aerial currents, but the proper deductions cannot be made, at least so as to carry full conviction of their justice, until the Diatomaceæ of various parts of the globe have been more carefully compared; the materials, indeed, for anything like a complete comparison scarcely existing at present. That these forms are widely diffused is well known, and that the same species may be capable of existing under very different circumstances is highly probable from the identity of many recent fossil species; but at present certain forms seem to be characteristic of certain districts, though further investigation may show that their geographical distribution is as wide and indefinite as that of many of the lower fungi and lichens. Very shortly before the completion of his work, materials came into the author's hands from the Bonny river, on the western African coast, but they did not agree with the species occurring in the dust from the Atlantic. Perhaps no organisms are so capable of enduring extremes of heat and cold as the Diatomaceæ. Myriads occurred in the Pancake ice and in deep soundings in the highest latitudes reached by the Antarctic expedition, and it has lately been discovered that vast numbers flourish on the branches of trees in the virgin forests of South America.

Every, so called, shower of blood is not, however, due to the presence in the air of these bodies, mixed with mineral colouring matter. It is an old opinion, which has been taken up in modern times with reference to the cholera, that epidemic diseases have been preceded or attended by showers of blood. Such appearances are sometimes due to the well-known Palmella cruenta, which may be found at the base of damp walls at almost all seasons. Stains were shown to us two years ago, as portentous, which were clearly the mycelium of some Epicoccum; and, in Prussia, in the year 1848, bread and other provisions were extensively spotted with little masses, due to the presence of an organism which was named Monas prodigiosa. Specimens of this production were forwarded to us, but we did not succeed in propagating it, though a mould with which it was accompanied (Ascophora floræ) grew with great luxuriance on paste made with ground Rice. It may be interesting also to notice the black rain which fell in the south of Ireland, in April 1849, over a district of 700 square miles. The colour was, in this case, due to portions of decayed plants, probably carried up from the extensive bogs of that country, mixed, like the trade wind and Sirocco dust, with Diatomaceæ and the bodies to which Ehrenberg has given the name of Phytolitharia.

To return, however, to the dust deposited by the trade winds. In general, it may be remarked that land and fresh-water forms are most numerous in this deposit, with which the samples from the southern parts of Europe agree very closely in composition. Forms characteristic of Africa do not occur, the greater part being common to many parts of the world—to Europe, for instance, as well as Africa. Some forms occur which are peculiar to America. The fine deposits of dust in Africa, as far as at present observed, are not red, but white and grey. No red dust has been discovered; and, if it existed, there is no trade wind in the interior of Africa which could carry it out to sea. The existence of American forms, which increase in number with repeated observations, make it probable that they are borne by an upper current, and sinking down through this in the course of their passage into the lower current, are carried back again towards their native American coast. It is, indeed, at present only matter of conjecture that such an upper current exists, except the strong south-western wind which Humboldt experienced at the top of the Peak of Teneriffe, and Glass notices as existing in the most elevated parts of the Canaries, whilst all other portions of the islands are under the sway of the trade wind, be considered decisive as to the point; in confirmation of which is the fact of ashes from the eruption of the volcano in St. Vincent in 1812 being carried to the island of Barbadoes contrary to the direction of the trade winds. The examination of the trade-wind dust assumes a very interesting form when taken in connexion with these curious phenomena; and it is well worthy of observation, that (however imperfect our knowledge of exotic Diatomaceæ may be) no light could have been thrown upon the subject without the minute and extensive researches which have for so many years engaged the attention of Ehrenberg, as the discrimination of individual forms and local species is an absolutely necessary element in the data from which the desired inferences were to be made. The objection of "*cui bono*," often alleged even at the present day against devoting much time to the examination of such minute organisms, is, perhaps, more triumphantly overthrown by the work before us, than by any other collateral and accidental use which has been derived from their study. The investigation even of the meanest works of the Creator can never be without its use, so long as truth is the main object of research. The despised conchologist, for instance, is now recognised as one of the most useful fellow labourers of the geologist, a science which has in our days assumed an importance which places it on a level with the most honoured subjects of investigation. Other points of interest might be mentioned as the connexion of the deposits of dusts with meteoric phenomena, the season in which they are most prevalent, the peculiar character of certain deposits, &c.; but for these and other points we must refer to the work itself, as we have much exceeded our usual limits, and indeed have touched upon the subject quite as far as it is connected with the peculiar objects which we have in view in such notices.

In conclusion, it may be remarked that Ehrenberg has collected with the utmost diligence almost every recorded instance of these phenomena, from the earliest times, up to that of the publication of his book, and a very curious and interesting mass of facts has thus been got together, extending through nearly 70 pages of his work. It is curious that he still adheres to his original notions as to the animal nature of Diatomaceæ, notwithstanding the discoveries of Mr. Thwaites, which have been confirmed by other observers, and which were placed before Ehrenberg at Oxford, though apparently they failed of attracting his attention or interest very deeply. For our own parts, we have never entertained the least doubt as to the vegetable nature of these bodies, and had we done so they would have been completely dispelled by the convincing observations of Mr. Thwaites, even without ocular demonstration.

## Garden Memoranda.

Messrs. Chandler's Nursery, Vauxhall.—Lovers of Camellias will be glad to learn that the extensive collection of this favourite flower, for which this nursery is celebrated, is now in full bloom. When we state that they form a bank, 160 feet in length, and some 8 or 10 feet deep, some idea will be gathered of the kind of entertainment which it may be expected a visit to so large a display will afford. Red kinds this year are abundant and fine; but the white sorts have not succeeded so well, their buds having dropped more plentifully than usual before they expanded. The whole collection is neatly arranged, and in excellent order.

## Miscellaneous.

*The Gardeners' Benevolent Institution.*—We understand that Mr. Paxton has kindly consented to be chairman at the forthcoming anniversary dinner, which will take place on the 9th of June next, in aid of the funds of this Institution. In consequence of the celebrity Mr. Paxton enjoys, and the day being the Monday after the middle Chiswick *fete*, when a large number of the friends of the charity will be in town, we have no doubt that he will be well supported, and that this deserving Institution will derive much benefit from the selection

We learn from an advertisement in to-day's paper that two new pensioners will be elected on the Wednesday after the meeting.

## Calendar of Operations.

*(For the ensuing week.)*

FORCING DEPARTMENT.

As soon as the early forced Grapes are fairly set, the operation of thinning should be commenced, by judiciously removing all the berries that can with certainty be spared, and leaving those which remain for future consideration in such order that the removal of a berry at any time shall relieve the surrounding ones without disfiguring the bunch. The final regulation of the bunch need not take place till the berries are more than half swelled, but no sound reason exists why the first thinning should be postponed, as is often the case, until the berries have attained the size of large Peas, and are appropriating a great portion of the nourishment which ought to have been directed solely to the berries which are to remain. The operation should be performed with a pair of clean, sharp, long-pointed scissors, removing the whole of the footstalk along with the berry, but without injuring the footstalks of the others. Care should be taken not to touch any of the remaining berries with the hand, as this is frequently the cause of what is termed rust. Vapour from the pipes, while very hot, is injurious both to leaves and fruit; and the safest time to fill the vapour pans at this season, is about ten in the morning, by which time the heat of the pipes will generally be sufficiently moderate, and by the time strong fires have to be made the following morning, the pans will be empty. On cold, sunless days, no vapour is required. Vines, except when in flower, should be syringed regularly twice a day, until they have had their first thinning, when it should be entirely discontinued, and the requisite amount of moisture supplied by evaporation. The late Vines will soon be in motion, and on cold lying borders, some leaves and litter laid on so as to produce 60° or 70° of heat, will be of immense service. MELONS.—These will now require attention as regards training, leading out the strongest shoots only, and leaving space for the fruitful laterals which will soon be advancing The shoots should not be so numerous as to cause crowding of the foliage. Maintain a genial heat of 65° by night, and 75° to 85° by day, with a bottom heat of 80°. STRAWBERRIES.—Thin out the weakly blossoms, and give liquid manure to plants which are swelling their fruit. Be careful not to excite too much the recently introduced successions.

FLOWER GARDEN AND SHRUBBERIES.

The pruning of Roses may now be done with safety, and the operation should be brought to a conclusion as soon as possible. A distinction should be made between the autumn-blooming kinds, as Bourbons, Noisettes, Chinese, and Tea-scented Roses, which produce flowers more freely on the strong than on the weak shoots, and the summer-flowering kinds, which do not flower on the strongest shoots of the same season. From the former all the weakest wood which is not likely to flower should be cut away, and the stronger shoots shortened or thinned out, with the view to render the shape of the plant more symmetrical; for this reason, the shortening should be proportioned to the strength of the shoots, reducing the weak wood to a few buds, to induce a stronger growth during the ensuing season, following the opposite practice with the strong shoots, and removing the very gross ones altogether. With regard to the summer-blooming kinds, the production of exuberant wood should be as much as possible prevented. If there are no objections against leaving unpruned the strong shoots of the last year, they will produce an abundance of blossom upon the laterals which proceed from them; but if this is not convenient, they had better be entirely removed, pruning moderately the shoots of moderate growth, and leaving the weakest entirely uncut. The less exuberant varieties may be pruned a little harder, and the very weak-growing varieties harder still. A good deal will depend upon the artificial habit of the plants; if they are trained against a wall or pillar, many useful shoots may be retained, which would be objectionable in a standard, on account of appearances, but in both cases it should be a particular object to prevent anything like crowding amongst the shoots. By this time many buds towards the points of the shoots have commenced growth; and if early flowers are an object, a portion of these should be retained for this purpose, and, by shortening the rest of the shoots, a succession of blossoms may be produced. Avoid pruning too closely in all cases; if any error be committed, let it be on the safe side. It is no uncommon thing to see Noisette, Tea-scented, and China Roses entirely killed by being severely pruned. Standards of Hybrid China and Hybrid Perpetual Roses may safely be allowed to form large heads, when they look much more beautiful, and flower more abundantly than they do if pruned close, as we often see them. Standard Roses, if of kinds with a drooping habit, should be worked on very high stems, and the long shoots allowed to hang down with their own weight. These kinds, along with the Banksian, Scotch, and Sweet Briar family, should not be pruned till they have done flowering. Dahlias, for general flower-garden decoration, should now be placed in a little heat, parted and potted as soon as they have made a few inches of growth. Marvel of Peru, Tigridias, Oxalis Deppei, Anomathecas, and other half-hardy roots, may be started in a frame, and particularly the beautiful Salvia patens. If the stock of the latter is deficient, it may be readily increased at this season by cuttings from the strong young shoots.

HARDY FRUIT GARDEN.

The winter covering should now be removed from Figs and Vines on outside walls, and the trees should be retrained; but, as entire exposure will be too much at first, it will be necessary to cover slightly with evergreens, or let down a canvas in front of the walls during night, especially in cold localities. Where Yew or other branches have been used, it will be well to see that the unfolding blossoms of Apricots are not too much shaded from the rays of the sun. A little labour will be well expended in going over the Apples, Pears, &c., painting them over with a mixture of lime, sulphur, and tobacco liquid, with as much soot added as will take away the glaring colour of the lime. This will destroy lichens and mosses, as well as any insects which may be about the branches; and as the genial spring weather will soon cause these depredators to creep forth, this is an excellent time for the operation.

KITCHEN GARDEN.

This week and next are very important ones in gardening matters, as many of the principal crops of the season now require to be put into the ground; success depending in a great measure upon the condition into which the ground has been brought by winter digging and manuring, and upon its being now in a good state of tilth for the reception of the seeds. Asparagus beds should now be made where new plantations of this excellent vegetable are required. Two-year-old plants should be chosen, as they come soon into use; the proper time for planting them being when the young growths have started several inches. The beds should be set out 4 feet wide, and made good by trenching and manuring to a depth of 2½ feet; the alleys between being about 3 feet wide. Another plan which is followed by many gardeners, and produces very fine Asparagus, is to plant it in rows 3 feet wide over the compartment, and 1 foot apart in the row. The whole or a portion of the old soil should be removed, according to its condition and quality, and replaced with some which is rich, but not retentive; a sandy turfy loam, enriched with well-rooted manure, is the best preparation that can be made in inland situations; but near the sea the Kelp-weed should be procured. Its natural habitat is the sandy shore, or the edges of rivers near their confluence with the ocean, and it is always found to flourish best when it is within the influence of salt-water. After so mild a winter, the Cauliflower plants in frames and under handlights will be getting too large, and many of them will "button" if they are not soon transplanted into good ground in a sheltered situation; they may then be protected from cold cutting winds by fixing some Yew or Spruce branches round them. After planting out all the largest, take up the smaller ones with some soil to them, pressing it into a compact ball between the hands, and replant them in the frame; from whence, in a fortnight or three weeks, they will remove with a mass of fine young fibres, without receiving the slightest check. Cauliflowers to remain under handlights should be thinned out to five plants in each light; the soil about the plants should then be loosened up, and if dry, a good watering of rich water may be given. Let them have free exposure during mild weather, lest they be drawn up weak, and only produce small heads. Asparagus beds should receive their spring dressing as early in the month as possible. Remove some of the protection from Artichokes, which are now pushing fast; as too much covering only blanches and weakens the young shoots. Spring sown Cabbages and Cauliflowers should be pricked out as soon as they are strong enough, and successional sowings made. Brussels Sprouts, Savoys, Curled Greens, &c., should now be sown for the earlier crops. Lettuce and Celery sown in frames some time since, should now be transplanted; the latter into a prepared frame of light soil, and the former into a protected border, for early use; successional sowings should be made of these, along with Radishes and other salads. A succession of Peas and Beans, Parsley, Spinach, and Turnips, should now be sown. Parsnips should be sown immediately, in deeply trenched ground, with an additional small crop of Early Horn Carrots, and a small early crop of Beet. The main crop of Onions should now be sown, and a small bed of the silver-skinned, very thick, to produce small bulbs for pickling. If the ground is rather stiff, the operations of sowing and digging should proceed together, that the soil may be left as loose as possible; but, if light or sandy, it should be made moderately firm and compact, by treading or rolling it after it has been dug. In the latter case, it is most convenient to sow broadcast in beds, and rake the seed in; but in the former description of ground it is better to sow in shallow drills.

State of the Weather near London, for the week ending March 6, 1851, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 9th 1826—therm. 68 deg.; and the lowest on the 10th, 1847—therm. 7 deg.

## Notices to Correspondents.

ACHIMENES: *G B N.* Damp is no doubt the cause of your failure. Try the effect of wintering them in dry silver sand.‡

APHIDES: *Fylde.* Enveloping the trees in a parapetticoat (parasol and petticoat united), and fumigating with Tobacco smoke, from Brown's fumigator, is the best remedy.‡

APRICOT: *C C.* It may be kept in a pot in common garden soil till it is convenient for you to plant it out; but you must see that its roots do not become cramped for want of room; when symptoms of that appear it must be shifted into a larger pot. It should be watered whenever the soil is dry.‡

ARBUTUS BERRIES: *G B N* will thank some of our correspondents to inform him how to preserve or pickle these for garnishing.

BACK NUMBERS: Full price will be given for No. 41, 1850.

MELONS: A correspondent who has sent us seeds of the Calabrian Green-fleshed Melon will be glad to know that it is sent to the garden of the Horticultural Society for trial.

BEGONIAS: *F W.* We perceive no merit in the seedling; its tendency to produce buds all over its branches is remarkable, that is all.

CEMENT: *J S.* We have never yet seen cement stand when used as a casing for hot-water tanks; the joints always break by alternate contraction and expansion produced by the varying temperature of the water. Wood is better. If you must have cement, you had better try the "Portland." The soil is almost certain to become too wet if the joints of the tiles are left open.

CHINESE PRIMULA: *J* and *J H.* The finest two blooms of the kind we have ever seen. They measure fully 2 inches across, possess great substance, and have brighter colours than are usually found in such flowers at this season.*

COTYLEDON UMBILICUS: *H M.* This is common in the west of England and in Wales. You may probably procure it of the Bristol nurserymen.

DEODARS: *P.* These require no stakes, and should not have them. If large when they are planted, a triangle of stakes may be useful to keep them upright long enough to make roots: but that is needless if they are properly planted. The young shoot naturally droops, and should not on any account be interfered with; it always straightens itself.

FRENCH GARDENING: *S H.* We cannot help you. "W." is unknown to us; but, as a reader of the *Gardeners' Chronicle*, he would see an advertisement if one was inserted.

GLASS: *J S and H C.* We have reason to believe that Hartley's patent rough plate is suitable for every gardening purpose for which glass is employed.‡

GRAFTING: *An Amateur.* Peg-grafting is not included amongst the modes described by D'Albret. It is mentioned by Thouin in his *Monographie des Greffes*. A stout scion should be selected of one or two years' old wood: its lower end should be made like a peg, removing all the bark and a little of the wood, so as to form a shoulder, and to fit a hole bored in the side of the stock, or tree, to the depth of one or more inches, according to the size. The inner bark at the shoulder of the scion should touch the inner bark of the stock; for all depends on this; here alone a vital union is formed; beyond this the inserted portion will unite no more than would a peg made of old ship-timber. Now is a good time for the operation.||—*Zeta.* We have no present intention of publishing the series of articles on this subject in the form of a pamphlet.‡

HEPATICAS: *Sub.* They may be moved in autumn, when they have done growing; but they are plants which very much dislike moving at all, and it often takes a long time to perfectly recover them after the operation. You may prune back and shift your Rosa Devoniensis now. Fibry loam and leaf-mould will suit it perfectly.‡

HORTICULTURAL SOCIETY: *F M S.* The rules will be sent if you will favour us with your address. They are too long to print. September is better than March for removing your young trees, and so is April.

INSECTS: *Tamworth.* If you will send us a specimen of the insect, we may then be able to answer your question.‡

LAYERS: *F H S.* As your layers are rooted, they may be separated from the stools now ‡

NAMES OF PLANTS: ? ? Stellaria media, or common Chickweed, and the single white variety of Viola odorata.—*Silvio.* Hippeastrum bulbulosum—the variety called pulverulentum. —*R W.* The only Cupressus sp. from California distributed by the Horticultural Society is C. Goveniana. It distributed Cupressus sp. Mexico, which is the same as C. Lindeana.¶

PAWLOVNIA: *J A.* We have not seen such an experiment tried; we certainly would expose a part of the cask to the action of the sun, and that part we would paint black, which, *pace tua*, is a far better garden colour than green.

FIGS: *E F K.* Having spare sashes, you cannot do better than place them over your Fig trees now, but so as the trees may have sufficient air; and keep them on till danger of frost is over. Why Figs ripen better in some places, and not in others, quite as warm on the whole, is not yet understood.||

POST-OFFICE: *M N E.* We presume that flower seeds may go by post to any part of the world, provided the sender disregards the cost of postage. The "Vegetable Kingdom" does not contain any etymology of the names of genera. It has a very complete list of names, as you probably know, but nothing further.

POTATOES: *W K.* The Early Manly is considered the most productive very early variety.||

VINES: *L H, Lancashire.* You should plant in the warmest division of your Vinery, two White Muscats of Alexandria, one Black Hamburgh, one Sweetwater, one White Frontignan, one Black Tripoli. The remainder in your list will succeed in the cooler division.||

WALLFLOWERS: *Dublin.* It is a remarkable form of the common double bloody sort; but we have no name to suggest. No one has yet taken to name the little varieties of Wallflower. We do not know where it is to be purchased.

SEEDLING FLOWERS.

AMARYLLIS: *W W.* No improvement on the kinds we already possess.*

CINERARIAS: *W D.* Not worth cultivating.*—*B.* Considerably bruised and shrivelled when received; but apparently inferior to kinds possessing similar colours already in cultivation.*—*Z Z.* Wanting in brilliancy, and deficient in shape. The large flower is in all respects the best.*

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS,

AS THE

ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by Dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

MANURE DEPOT.—PEAT CHARCOAL.

TO FARMERS, AGRICULTURISTS, AND OTHERS.

G. H. FOLEY, Essex Coal Wharf, Lea-bridge, Middlesex, Agent by appointment to the Irish Amelioration Society, for the sale of the above. All needful particulars will be given on application at the above address.

Price of the unmixed Charcoal, 60s. per ton, sacks included. Mixed with Night-soil, 45s per ton, sacks included.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... | ...£11 | 0 | 0 |
| Turnip Manure, do. ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per on, in dock. Sulphate of Ammonia, &c.

ARTIFICIAL MANURES.—PRIVATE INSTRUCTIONS in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.

Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

PHOSPHATE NODULES, OR COPROLITES AND FOSSIL BONES (from the Suffolk Crag).—Manufacturers of Superphosphate of Lime can be supplied with the above, either in their natural form or finely pulverised, on the best terms, f. o. b. or delivered in the Thames.

Applications to EDWARD PACKARD, Chemist, Saxmundham, Suffolk, will receive prompt attention.

SALT for Agricultural Purposes, Asparagus Beds, Garden Walks, &c., &c., price 23s. per Ton, delivered in Sacks to any Railway Station in London. Sacks to be paid for or returned. Apply to JOHN MEREDITH, Salt Merchant, 10 Wharf, City-road Basin, London. N.B. Rock Salt.

PATENT CREOSOTED FISH FOR MANURE.—This manure is composed entirely of animal matter. The analysis of an eminent chemist states that one ton of the prepared fish contains 263 lbs. of ammonia, 150 lbs. of phosphate of lime, and 39 lbs. of potash. It will be seen that they contain all the manuring properties of the best guano, and as they cannot be adulterated, they will be found to be a most useful manure for Potatoes, Wheat, Oats, Carrots, and all root crops. They also have the property of preventing the Potato disease. All the Potatoes planted with them last year, produced good crops, and were entirely preserved from the disease, although the neighbouring fields greatly suffered. See Report of the Royal Agricultural Society of Dec. 11, 1850. Price 5l. per ton. Orders received by Mr. HENRY HILL, Corn Exchange, Mark-lane; Mr. GEORGE BUSH, 22, Abchurch-lane; and Mr. BENNETT, 73, Mark-lane, London.

IRISH PEAT CHARCOAL.

TO FARMERS, AGRICULTURISTS, AND OTHERS.

MESSRS. ODAMS AND PICKFORD, 35, Leadenhall-street, having been appointed by the IRISH AMELIORATION SOCIETY sole Agents, for London, for the sale of their PEAT CHARCOAL, beg to say full particulars of prices, &c., may be obtained on application to them.

ODAMS and PICKFORD, 35, Leadenhall-street, City.

DESICCATED ANIMAL MANURE.—This Manure, which has proved so eminently successful in the culture of both Cereal and Green Crops, can now be had of the Manufacturers, J. M'CALL and Co., 60, Spring Gardens, Manchester; RITCHIE and M'CALL, 137, Houndsditch, London; and of all Agents Price 7l. per ton.—Copies of Analysis and Testimonials forwarded post free on application.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND CO. beg to notice their mixtures of GRASS SEEDS for Laying Land down to Permanent Grass, are now ready for delivery. They have reduced the price to 30s. per acre, allowing 2 bushels 12 lbs. to the acre.

Mixed sorts for improving old Grass Land, 1s. 2d. per lb.

Fine sorts, for forming Lawns, 1s. 3d. per lb. Directions for sowing will accompany the Seeds.

GEORGE GIBBS and Co. will feel happy in sending general priced Catalogues of Agricultural and Garden Seeds, on application to 26, DOWN-STREET, Piccadilly, London.

TRUE DRUMHEADS for CATTLE, also EARLY BATTERSEA, the large Imperial, Early Vanack, &c., at THOMAS WELLANDS, Surrey Gardens, near Godalming, Surrey, packed and delivered at the Godalming Station, 3s. 6d. per 1000; the large Asiatic Cauliflower Plants, 3s. per 100.

COCHIN CHINA FOWLS' EGGS, for Hatching from the best Birds, 1s. MALAYS, 1s., and SPANISH, 6d. each, warranted genuine. Sebright's Spangled Bantam and Polish Fowls' Eggs in April. Orders sent into the country, securely packed, on receipt of Post-office Order (not Stamps), with 1s. extra for box, booking, &c.—Apply to TIMOTHY MASON, No. 5, Bears'-place, New North-road, Islington.—Cochin China and Spanish Fowls, Almond Tumblers and Carrier Pigeons for sale. Letters requiring reply to enclose Stamps.

COCHIN CHINA EGGS.—As a general answer to various Correspondents and others, HENRY COPLAND will supply the public with Eggs from these fine and prolific Birds at 10s. a setting of 13 Eggs.—Apply to Mr. HENRY COPLAND, Chelmsford, Essex. A few fine young Cock Birds for sale.

GRASS AND OTHER SEEDS.

THOMAS GIBBS AND Co., the Seedsmen to the "Royal Agricultural Society of England," corner of **Half Moon-street**, Piccadilly, beg to call the attention of their friends to the following Seeds:

Mixtures of selected Natural Grasses for laying down Land to permanent Meadows and Pastures, apportioned to suit the nature of the soil.

Mixtures for portions of Parks near Mansions.

Mixtures for Garden Lawns and Grass Plots.

Mixtures for renovating Old Pasture Land.

Italian, and other Rye-grasses.

White Belgian and Red Altringham Carrots.

Gibbs' new very large Parsnip.

Orange Globe Mangold Wurzel.

Long Red and other kinds.

Drumhead and Thousand-headed Cabbages.

Swedes, Hybrids, and other Turnips.

Clovers, Kohl Rabi, French and English Furze.

Sainfoin, Rape, Tares, White Mustard, and all Agricultural and Kitchen Garden Seeds, &c.

Priced Lists are now ready, and will be forwarded free, on application, by post, or otherwise, to corner of **Half Moon-street**, Piccadilly, London.

THE SKINLESS CHEVALIER BARLEY.—The valuable malting properties of this Barley, and the handsome appearance of the grain, are as superior to the Peruvian Skinless Barley as the finest Wheat is superior to Rye. Messrs. SUTTON have but a limited quantity; therefore, to prevent disappointment, it is requested that those of their friends who wish to try it will apply early for the Seed. Price 5s. per peck. Samples may be had by post, by enclosing two postage stamps.

*See* Messrs. SUTTON'S *Advertisement in the last page of the last Number of the Gardeners' Chronicle.*

EARLY AND CATTLE CABBAGE.—Stout bedded plants of superior true sorts, 4s. 6d. per 1000, package included, delivered free of carriage to the Edenbridge station, South Eastern Railway.—Address to JOHN CATTELL, Westerham, Kent.

PURCHASERS OF AGRICULTURAL SEEDS are recommended to peruse Messrs. SUTTON'S NEW PRICE LIST, which appeared in the last page of the *Gardeners' Chronicle* of March 1st. The advantages Messrs SUTTON are enabled, by their extensive trade, to afford agriculturists in supplying *genuine home grown Seeds at the low prices therein quoted, and free of carriage*, will doubtless be appreciated in these times of economy and agricultural improvement. The following are a few of the articles therein enumerated:—

| | Per lb.—d. | | Per bushel—s. d. |
|---|---|---|---|
| Mangold Wurzel ... | ... 6 | Giant Saintfoin ... | ... 10 0 |
| White Belgian Carrot | ... 9 | Dickinson's improved Italian Rye-grass | ... 7 6 |
| Fresh imported Lucerne | ... 9 | True Perennial ditto | ... 7 0 |
| Parsnip ... ... | ... 9 | Common ditto ... | ... 5 6 |
| Ashcroft and other Swedes | 9 | Furze (Ulex Europæus) | ... 6 6 |

| | £ s. d. |
|---|---|
| THE BEST SORTS OF PERENNIAL GRASS SEEDS FOR PERMANENT PASTURE, *mixed expressly to suit the soil, with instructions for sowing, per acre* ... | 1 8 0 |
| SUTTON'S RENOVATING MIXTURE, *for improving old Pastures, per lb.* ... ... ... ... ... | 0 0 10 |

Reading Seed Warehouse, Reading, Berks.

# The Agricultural Gazette.

*SATURDAY, MARCH* 8, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, March 12—Agricultural Society of England.
THURSDAY, — 13—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, — 19—Agricultural Society of England.
THURSDAY, — 20—Agricultural Imp. Soc. of Ireland.

THE TULLIAN SYSTEM OF AGRICULTURE, as it is called, which is being urged upon the attention of our readers by no mean agricultural authority, has, it must be remembered, its faults as well as its merits. The thorough disintegration and tillage of the soil which it commends, do not diminish the need or the value of the manure heap, which it appears somewhat to despise. Cattle, manure, corn, are a true sequence of results. The last may be the rent paying and profitable member of the series, but we fear that, without the second, and therefore, as a general rule, without the first also, it cannot be attained. Drainage and tillage, the one by the greater efficiency it confers on water, as the solvent of food for plants, and the other, by the greater scope for this solvent, which, under a given extent of soil it affords, may have most fertilising tendencies, but neither of them are fertility itself. Neither of them are increased nourishment itself: they are merely an improved *cuisine:* the family may improve under it in health and vigour, but the larder is all the while only the more rapidly being exhausted; and unless greater attention than ever be paid to replenishment there, the temporary improvement will be succeeded by utter starvation.

No doubt the soil is not only a storehouse, it is in a great measure itself the very substance of food; and so long as a current of water be maintained throughout it by drainage, the rapidity with which it will supply this food in a soluble form depends upon the aggregate surface presented by its particles to the dissolving agent. Let these particles, spheres or cubes, or any other regular figure, be reduced one-half in their linear dimensions, and the whole surface they will present will multiply fourfold. Reduce a soil, therefore, by tillage, and the roots of plants will have a greatly increased pasturage. Make every particle within it smaller, and the field on which their roots may feed will become larger in a rapidly increasing ratio. And this is exactly the phraseology used by TULL. He evidently believed that the very substance of the mineral soil went to build up the substance of the vegetable living upon it. Of course there is a sense in which this mode of putting it is correct enough—but it is not the sense which TULL himself entertained. He believed that attention to tillage greatly diminished the need of manure: and there is still danger of his admiring followers being similarly misled. We believe that the need for manure, so far from being diminished, is increased. When either the power or facility of manufacture is increased, the supply of raw material must be increased also. And as we believe that the vegetable part of the soil, and even much of its mineral part also, will all the more rapidly go for thorough draining and Tullian tillage, we believe also that the manure heap must be increased as well; and that an increased power of manufacture conferred upon the soil, must be accompanied by an increased supply of the raw material for manufacture, if a permanent benefit is to be realised.

It is not unnecessary to insist occasionally on first principles like these, when we find those whom men justly name doctors in agriculture, praising and recommending practice which, however good in itself, is necessarily imperfect. Mr. HEWITT DAVIS not only praises Mr. SMITH'S imitation of TULL—in which we gladly join him—but along with his commendation speaks disparagingly, in which we cannot join him, of the manure heap and its origin in stock-keeping. His experience has taught him, so he says, "to look with distrust at the pains many are taking to impress upon arable farmers the necessity for placing their chief dependance on stock-keeping, to give them the means of profitably growing corn." Our experience has taught us, we confess, to look with distrust not only on statements of extravagant results of all kinds in farming—and we say this without the smallest intention to include the account of Mr. SMITH'S experience among them—but on anything like a one-sided or partial statement of agricultural truth. Tullian agriculture is an excellent thing, just as improvements in machinery are good: both undoubtedly benefit the manufacturer—but they are beneficial, simply by the ability thus given to work up that larger quantity of raw material which they call for, and which must be supplied. No doubt the warehouse may be filled to begin with; and, perhaps, no man knows the wonderful resources of a well tilled soil, of ordinary natural fertility; but it *is* exhaustible, and the period of its exhaustion under such management as TULL recommended, and as his followers somewhat less confidently point out, is approaching, whereas, under a perfect system of management, it ought if anything to be receding.

Free trade may or may not have reduced the value of agricultural produce; at all events it *is* much reduced, and we believe that while the "corn-grower may yet get rich" in the prosecution of his business, when all his circumstances shall have accommodated themselves to the reduced standards of value, it will be not merely by a more energetic and diligent tillage of the soil, but also by a more energetic and diligent supply to the soil of the food on which his plants are to live. The value of Wheat and other grain is greatly reduced, and there is not that we are aware any such reduced value in guano and other purchaseable fertilisers for immediate application to these crops as might have been looked for; but though the value of meat has also been reduced, there *is* a very material reduction in the cost of the raw material—purchaseable cattle food—out of which *it* is made. And, while we willingly second Mr. HEWITT DAVIS in his efforts to impress upon our readers the importance of deep and thorough tillage to a good Wheat crop, we would quite as strongly urge upon them the importance of the meat manufacture, as a necessary and most influential part of farm management over the greater part of this country. We believe that it alone might be a profitable business, even at 5*d.* per lb. for beef; and we believe that, at all events, in the absence of it, the soil will not long continue to grow Wheat at 5*s.* a bushel.

## FARM ACCOUNTS.—No. I.

SPECIFICATION OF THE FARM.

| Acres. | Name of Fields | Last year's Crops. | Intended Crops. | Rental in proportion to value. | Net Rent. £ | s. | d. |
|---|---|---|---|---|---|---|---|
| 12 | Dairy Field | Beans | Wheat | 30s. per acre. | 18 | 0 | 0 |
| 8 | Pond Field | Clover | Wheat | 15 ,, | 6 | 0 | 0 |
| 20 | Stable Field | Wheat | Fallow | 20 ,, | 20 | 0 | 0 |
| 10 | Barn Field | Barley | Beans | 18 ,, | 9 | 0 | 0 |
| 10 | Church Field | Barley | Clover | 20 ,, | 10 | 0 | 0 |
| 12 | Wood Field | Fallow and Turnips | Oats | 20 ,, | 12 | 0 | 0 |
| 8 | Path Field | Fallow | Barley | 25 ,, | 10 | 0 | 0 |
| 6 | Brook Meadow | Mown | ... | 33 ,, | 9 | 18 | 0 |
| 9 | Home Pasture | Fed | ... | 28 ,, | 12 | 12 | 0 |
| 5 | Cuckoo Wood | ... | ... | 10 ,, | 2 | 10 | 0 |
| 100 | | | | | 110 | 0 | 0 |

The farm may be considered 110 to 112 acres, including hedges, ditches, lanes, waste, &c., but only 100 acres under cultivation; consequently the rent 110*l.* is charged on the same, and the rent-charge is made according to the considered good or bad quality of the land, as it is not just, in minute and truthful calculations, to charge all the land, whether good or bad, at the same rate. One of my objects in thus apportioning the rent is to show, that it is to the advantage of the farmer, in taking a farm, to choose the best he can obtain (I had almost said regardless of the rent), as it will be found that GOOD LAND is farmed at less *expense* than BAD; and if producing but a quarter of Wheat per acre more than poor land, it yields a much greater profit, notwithstanding the increase of rent, as a greater produce will be realised in every other species of grain, &c.

INVENTORY OF FARM STOCK, &c.

| | £ | s. | d |
|---|---|---|---|
| 4 Horses (three mares), at 25*l.* each | 100 | 0 | 0 |
| 1 Waggon | 25 | 0 | 0 |
| 2 Carts, at 10*l* each | 20 | 0 | 0 |
| 2 Ploughs, at 2*l.* 10*s.* each | 5 | 0 | 0 |
| 1 Set heavy harrows | 3 | 0 | 0 |
| 1 Set light ditto, at 1*l.* 15*s.* each | 3 | 10 | 0 |
| 1 Heavy roll | 6 | 0 | 0 |
| 1 Light ditto | 3 | 0 | 0 |
| 1 Drill | 20 | 0 | 0 |
| 1 Dressing Machine | 6 | 0 | 0 |
| 3 Sets of horse harness complete } 2 Sets of thick ditto ditto } | 9 | 0 | 0 |
| 2 Pair plough harness complete, and plough lines | 4 | 10 | 0 |
| 3 Cart ropes | 1 | 5 | 0 |
| 2 Cow cribs, at 1*l.* each | 2 | 0 | 0 |
| 8 Sheep troughs, at 10*s.* each | 4 | 0 | 0 |
| 2 Dew rakes, at 10*s.* each | 1 | 0 | 0 |

| 100 Hurdles | 6 | 0 | 0 |
| 30 Sacks | 2 | 0 | 0 |
| Seed cob, sieves, fan, bushel forks, shovels, spades, rakes, &c. | 3 | 10 | 0 |
| Sundries | 10 | 0 | 0 |
| | £236 | 15 | 0 |
| 2 Cows, at 9*l.* each | 18 | 0 | 0 |
| 2 Sows, at 1*l.* 5*s.* each | 2 | 10 | 0 |
| 10 Pigs, at 10*s.* each | 5 | 0 | 0 |
| Poultry, &c. | 2 | 10 | 0 |
| 150 Loads of manure, at 3*s* per load | 22 | 10 | 0 |
| 6 Tons of Clover-hay, at 3*l.* per load | 18 | 0 | 0 |
| 7 Tons of Grass-hay, at 2*l.* per load | 14 | 0 | 0 |
| 10 Acres of Clover-hay, at 8*s* 6*d.* per acre | 4 | 5 | 0 |
| 20 Acres of Fallow, 6 ploughings, at 7*s.* 6*d.* per acre | 45 | 0 | 0 |
| 2 Harrowings, at 1*s.* per acre | 2 | 0 | 0 |
| 2 Rollings for 12 acres Turnips, at 1*s.* per acre | 1 | 4 | 0 |
| Seed for ditto | 0 | 12 | 0 |
| Sowing, harrowing, hoeing, &c, at 12*s.* per acre | 7 | 4 | 0 |
| Manure, carting, and spreading, &c. | 27 | 10 | 0 |
| Rent on 20 acres | 22 | 0 | 0 |
| Straw from 20 acres Wheat } Ditto 20 ,, soft Corn } Ditto 8 ,, Peas } | 20 | 0 | 0 |
| | £449 | 0 | 0 |

N.B.—The farm stock in the above valuation is not *new*, but in *good condition*.

I think it may be advisable, before I proceed further in the actual working out of my system, to explain the nature of the books I intend making use of. They will be as follows: 1st, Labour Book. I am not aware that any form of my own can be better than several I have examined, so long as they give a clear description of all the work done, and where done. 2d, Day Book—in which must be entered every circumstance as it occurs, whether debtor or creditor; of course, the labour weekly only. 3d, Cash Book—which must contain all money transactions whatsoever, debtor and creditor. 4th, Journal—in which will be arranged *monthly* all transactions under their several heads, for posting into the ledger. Some parties may perhaps think this book unnecessary, and only giving *considerable trouble*, but it will be found to have the effect of placing every transaction in a much clearer manner, and also save the numerous entries in the Ledger, which, without the Journal, must occur, so that in the end the labour is the same, and the Ledger thereby rendered more concise. 5th, Ledger—the nature of which is so thoroughly understood, that it is unnecessary to say a word with reference to it. *W. F., Gay Bowers, Danbury, Essex.*

## ON THE CULTIVATION OF CHICORY.

*Soil.*—Rich dark loam is the most suitable, though it will grow in any good land, but the weight of the crop per acre and quality will depend on the land. A rich soil in good heart and condition, such as is fit for Barley, Wheat, or Turnips, will do, not forced by the application of too much manure. One grower says, "The land cannot be made too rich with manure, but it is best applied the year previous to the Chicory crop. I have sometimes taken a Wheat, and an Oat, and a Potato crop after Chicory, and done very well. The finer the surface of the land the better." Six tons per acre is a moderate crop—seven or eight not uncommon. In good land in Cambridgeshire it is stated that ten tons per acre have been grown.

*Time of Sowing.*—It must be sown within a day or two of the 12th of May, not later or earlier; if later, it will produce runners or woody fibrous roots; if earlier, it will seed, which it should not do.

*Seed.*—Some growers say that 2 lbs. per acre is enough, others state that 3 to 5 lbs. are required. The seed of the large white kind is the best.

*Cultivation.*—The land should be in as clean a condition as possible. It is best sown in ridges about 18 inches apart, and about 1 to 3 inches between the plants. One grower in Lincolnshire says, "1½ lb. of seed per acre, drilled in ridges one foot to 15 inches apart, passing the seed through a barrow drill of two rows. Cleaning with me has been done by a horse-hoe between the rows, when the soil is sufficiently dry, not to run in heaps so as to cover the small Chicory plant." Weed, dress, and furrow up as you would Carrots or any tap root; runners to seed must be pulled up when they appear. Radishes are known to become what is called woody; Turnips are also liable to run to seed; the same is frequently the case with some of the plants of Chicory, notwithstanding it is sown at a proper time. Immediately plants appear in this condition, boys or women must be sent to pull them up, and the roots when dug must be kept by themselves. It is of great importance to keep them out of the crop; they are fatal to a good sample of root, because these woody roots will not roast, and appear when ground with good Chicory (which is like Coffee), as so much ground wood, and make it full of specks. To produce good Chicory, the most important matter to be attended to is, to avoid the roots running to wood. Chicory should be well cleaned. The plants must not be too thick, but properly thinned to allow of good growth.

*Harvesting.*—Chicory is taken by lifting, as Parsnips or Carrots. If the season be fine, digging may begin after the middle of October.

## ESTIMATE: A RAM BREEDING FARM.

A FARM of about 200 acres of good substantial Turnip and Grass land, at, say, 2*l.* per acre, would be of convenient size for our purpose. It should be a good, deep, dry, sharp loam, with an open bottom, and, if possible, a southern exposure—the land gently sloping, and a good climate. On such land the farmer would not be dependent on his grain crops. Supposing it to be farmed under the ten-shift course of husbandry, there should be 10 fields of 20 acres each. Under this course of management, the greater part of the farm would be in Grass, or 140 acres, which would be 20 acres new Grass for the tup hoggs, and 120 acres, of from one to six year old Grass, for the ewes and gimmers. The fallow break of 20 acres would be, say, 18 acres in Turnips, 1 in Potatoes, and 1 of Tares for horses. Calculating the ewe stock at 140, they should produce 180 lambs, allowing 40 to have twins. The stock to be wintered would therefore be 320; and as the Turnips, on such good land, and under such management, should be a full crop, 12 acres will supply the hoggs, five the ewes, and one for three cows, which should be the whole cattle stock on the farm, with one pair of horses, and an odd one. One ploughman and two lads could do all the work, except what is regularly done by women and daily workers. The expense of working the farm would consequently not be great; and if the land be well laid down with perennial Rye-grass, Clovers, and other seeds, it will be fully sufficient to keep the stock. Should there be any surplus Grass, it can be eaten by bought-in stock when required. Allowing 20 for deaths and other casualties, 80 shearling tups and 80 cast ewes and gimmers should be annually sold. The produce of such a flock should stand about thus:—

INCOME.

| | | | |
|---|---|---|---|
| 80 Shearling tups, at 5*l.* each | £400 | 0 | 0 |
| 80 Cast ewes and gimmers, at 2*l.* | 160 | 0 | 0 |
| 300 Fleeces of wool, at 6*s.* | 90 | 0 | 0 |
| | £650 | 0 | 0 |

EXPENDITURE.

| | | | | | |
|---|---|---|---|---|---|
| Rent | £400 | 0 | 0 | | |
| Purchase of high bred tups yearly £20 | 0 | 0 | | | |
| Sell one bought the previous year 8 | 0 | 0 | | | |
| | | | 12 | 0 | 0 |
| Shepherd's wages, besides his allowance of corn, sheep, and cow | | | 10 | 0 | 0 |
| ets and other incidental expenses attending the sheep, say | | | 28 | 0 | 0 |
| | | | 450 | 0 | 0 |
| Profit on sheep, after paying rent, &c. | | | £200 | 0 | 0 |

The next consideration is, will the grain raised on the farm, after keeping house, servants, horses, seed, and tup hoggs, pay the other expenses? Allowing 20 acres to be under Oats, and 20 under Barley, the proceeds will approximate to the following calculation:—

| | Qrs. | Qrs. |
|---|---|---|
| 20 acres of Oats, at, say, 7 qrs. per acre | | 140 |
| Say for tup hoggs | 30 | |
| ,, Seed | 12 | |
| ,, House and servants | 30 | |
| ,, Horses, besides light grain | 18 | |
| | | 90 |
| To sell | | 50 qrs. |
| | Qrs. | |
| Barley, 20 acres, say 6 qrs. per acre | | 120 |
| Seed, say | 10 | |
| Servants, &c. | 10 | |
| | | 20 |
| To sell | | 100 qrs. |

| | | | |
|---|---|---|---|
| 50 Qrs. Oats, at 18*s.* | £45 | 0 | 0 |
| 100 Qrs. Barley, at 21*s.* | 105 | 0 | 0 |
| | £150 | 0 | 0 |

PROBABLE EXPENSES ATTENDING THE TILLAGE LAND.

| | | | |
|---|---|---|---|
| Ploughman, lad, and boy, say | £20 | 0 | 0 |
| Servant girl | 6 | 0 | 0 |
| Cutting crop, and other expenses attending it, say | 20 | 0 | 0 |
| Daily workers, &c. | 10 | 0 | 0 |
| Tear and wear of horses, implements, tradesmen's accounts, &c., say | 20 | 0 | 0 |
| Seeds, say | 10 | 0 | 0 |
| Public burdens, insurance of stock, and other incidental expenses, say | 34 | 0 | 0 |
| Interest of capital | 30 | 0 | 0 |
| | £150 | 0 | 0 |

In addition to the above, the ploughman and shepherd must each have a cow; but there should be sufficient Grass in summer, and abundance of straw in winter, to keep them.

The above calculation, if correct, shows that the grain crop will pay the expenses of the tillage land, and also that the rent and profit are derived solely from the sheep; and in these times, 200*l.* on a 200 acre farm, should satisfy the farmer, and keep him respectably—as he would have from his farm, milk, meal, Potatoes, pork, poultry, and he could also feed his own lamb, mutton, and beef, and have, besides, the produce of his garden. Some farmers may think this a trifling concern, and not enough to occupy their time; but if such a farm produces and brings up annually 80 high-bred shearling tups in fit condition for sale, they should be content. Generally speaking, it would be as well if farmers were to give more attention to one particular branch of farming, and manage it with skill and attention, so as to make it profitable, in place of having too much in hand. *Dickson on Breeding Live Stock.*

## Home Correspondence.

*Open Furrows.*—Mr. Mechi, in his account of a "Trip to the North of Devon," expresses a hope that your correspondents will discuss the question of open furrows on heavy land. In a letter written Dec. 21, 1844, entitled "Conclusions relative to Surface Draining," by Mr. Mechi, I find in capital letters "the deeper the drains, even in the strongest soils, the quicker the water escapes." Is it not to the too rigid adherence to the rule of deep drains, that we may trace the necessity for open furrows in Essex? In proof that deep draining has long engaged my attention, I refer to a statement, illustrated with diagrams, in the Journal of the Royal Agricultural Society, vol. vi. part 2, page 489. It is there shown that "deep drains must be most effective, but to ensure this effectiveness the drains should be filled with some substance through which the water can percolate freely throughout their depth." Mr. Mechi began on this principle, except that he made his drains upside-down, placing the pipe at the top of the stones with which the drain was filled; he afterwards corrected this mistake, and running into the opposite extreme says, "If I had to re-drain my land I should place the pipes in the drains without stones or other matter, merely covering them with the clay itself." Then in a note to an extract from Mr. Parkes, "It would be curious, but probably more curious than useful (he now sees that it is useful) to learn the origin of this remarkable configuration given to land," namely, land cultivated on high ridges. The reason is simply because by this configuration the land is partially drained, and there is an approximation to the truth, that there is a mean in draining really stiff clays, a mean exceeded by 4-foot drains which makes it necessary to return to the open furrow. Close observation has convinced me, that at no time is the water so quickly removed, or nearly so, as when the drains are entirely open; suppose drains cut 30 inches deep, and at 30 feet intervals, in a soil of which the first 12 inches is tilth or broken ground, the remainder clay, increasing in tenacity to the bottom of the drain; it will be found that the first 12 inches of nearly the whole intermediate space is drained in 24 or 36 hours, if, as in the month of January last past, there are three rain falls which supersaturate the soil, the clay below this, 1 foot, will still be surcharged with water, though the tilth has parted with its water three times over; the question then arises how much more water would have been carried off by a 4 foot drain than that at 30 inches? If both were open I believe there would be little difference, if both were filled in I suspect that the 30 inch drain would have the advantage. Does water ever stagnate in a clay soil below a certain depth, so as to make it necessary to remove it? If a soil, such as I have described, be drained to the depth of 30 inches, how much water should we find (except that held in suspension by the soil) below that depth? Can Mr. Mechi or Mr. Parkes answer these questions? I am not speaking of a Hop-ground, the example given by Mr. Parkes, but a clay covered by 1 foot of tilth. Four feet drains filled in with clay would so retard the drainage of the tilth as to make open furrows necessary; let the drains be made at a less depth, or filled in with some substance through which the water may percolate freely, and will not the necessity for these furrows, with all their accompanying evils, be removed? *J. C. C.*

*Feeding on Boards.*—Being very scarce of straw this season, I was induced to try boarded floors for my cattle, which are tied up by the neck. The result has been, on the whole, satisfactory. I have always, however, used a little straw till within the last few days, when I have tried a pair on the boards alone, without a particle of straw, which is the plan, I believe, followed by Mechi and others. I cannot express any opinion how it may answer with me, but the poor animals seem standing so uncomfortably that I cannot fancy they will do well; the sparring, although wide, is so wet and dirty, that I am much inclined to revert to a little straw. Have you any experience yourself? *M. W.*

*Steam Boiler Flues.*—This subject, introduced into your Paper of the 25th ult., by Mr. Mechi, is one of great importance for the saving of fuel, and should be well understood by all who have steam-engines. There has lately been published a small work, costing but 1*s.*—"Armstrong on Boilers;" it gives more and plainer instructions on steam boilers than any work I have met with before; it would well repay any person having boilers to procure a copy. The plainest, safest, and most economical boiler for a fixed engine is a cylindrical one, and if put up on the principle Armstrong describes as the oven plan, will give great satisfaction, and the flues will be easy to clean. Armstrong says all cylindrical boilers of 6 feet diameter, and under, should be put up on the oven plan; and I am acquainted with one belonging to a relative in the South Staffordshire iron works, which is 25 feet long and 8 feet in diameter, put up on that plan with only one bridge, and

that placed at the end of the grate, which did very well, but latterly three other bridges have been put in, one at the end of the boiler, and the other two equi-distant from the one at the end of the grate and the one at the end of the boiler. The one at the end of the grate was 12 inches from the boiler, the next 10 inches, the next 8 inches, and the one at the end of the boiler was 6 inches, after that addition there was a saving of more than 25 per cent. of fuel; between the bridges were holes left to clean out the flues. All that can be said against this plan of a boiler is the quantity of water to be boiled, and, consequently, taking longer time to get up the steam than if there is a flue through the boiler. But if a flue through the boiler is adopted, there should be a door both back and front of boiler in brickwork, to enable the flue to be cleaned, or the evils pointed out by Mr. Mechi would assuredly take place. *R. Nicklin.*

*Hints on laying down Land to Permanent Pasture.*—It is highly important that the land should be cleaned from weeds, and well pulverised by repeated ploughing and harrowing before the seed is sown; and in cases where the soil is particularly loose or sandy, it is desirable that it should be also rolled before sowing; if this is not effected, the seeds (many of which are very minute) will some of them be too deeply imbedded in the soil, while others may not be covered at all. It is also desirable that the seeds should be sown when there is not much wind, and that they should be delivered from the machine or the hand placed rather near to the soil; otherwise, the smallest and most valuable of the seeds may be carried by the wind into the adjoining field or hedgerow. The harrows, which should be very light, must be again drawn over after sowing, and if the soil is very light and dry, the roller also; and if the soil is poor, a dressing of Peruvian guano, or superphosphate may be harrowed in with the seeds, at the rate of two hundredweight per acre. The sorts of seed should, of course, be selected in accordance with the nature of the soil, and the purposes for which the pasture is intended; this and much other useful information may be obtained from Lowe's "Elements of Agriculture," Stephens's "Book of the Farm," Sinclair's "Hortus Gramiensis," and other works; or from seedsmen and agriculturists, who have paid especial attention to this part of botany and agriculture. If corn is sown with the Grass seeds, it should not be more than 1 bushel, or 1½ bushel to the acre of corn, and for this purpose Oats are preferable to Barley. *On improving old Pastures.*—Having as far as possible eradicated the strong growing weeds, and coarse Grasses, and improved the condition of the land, according to its requirements, if any, heavy harrows should be drawn over the old turf early in the spring, to loosen the soil for the admission of seeds of the finest and most nutritive kinds of perennial natural Grasses and Clovers, which, if sown freely, will occupy the numerous small interstices between the plants of Grasses already growing, and thereby prevent the luxuriant growth of coarse Grasses and noxious weeds. It is a good practice to sow these seeds at the same time as the top dressing is applied; but this is by no means necessary. (*From Sutton's Catalogue of Natural and Artificial Grasses.*)

*Draining.*—"Agricola Redivivus" having passed his opinion so inoffensively, and desired me to correct his calculation, if "I can do the work cheaper," I readily respond to his wishes; but first I must distinctly inform him that he misunderstands me. I do not advocate stone draining where pipe-draining can be done more economically. I have put in hundreds of thousands of pipes where stone could be had a few hundred yards off, for digging and carting. What I complain of is that we are not allowed by the Government Inspectors to use the stones which are dug out of the drains in making them, but have to submit to the damages and expenses of carting them off the land, when those very stones might be put into the drains at a trifling cost, and either save the pipes entirely or be put in, in addition to the pipes. If "A. R." will kindly take a trip to Bristol, and thence 6 or 7 miles on the Gloucester road he will see very many acres apparently covered with stones thrown out of the drains, which will have to be carted off at as much expense as "A. R.'s" were carted on, and with an equal degree of damage to the land. Surely it would be economical to bury those stones on the spot, and take the chance of making the soil a little more porous and pervious to the surface water, which there is more mischievous than water from the springs. The stone is of no value for roads or walls. Now as to the calculations. "A. R.'s" calculation is erroneous, 90½ rods per acre will not require 2178 pipes; the quantity of stones per acre is very wide of the mark, and 90½ rods per acre is a curious quantity for an acre of systematic draining; the drains would be rather more than 29 feet apart, an odd width to adopt. The following is the cost per acre which I have paid for years, and the works are executed in a good, substantial and satisfactory manner.

| | £ | s. | d. |
|---|---|---|---|
| 4 feet drains, 30 feet apart, 1452 pipes, at 17*s.* per 1000 | 1 | 4 | 8 |
| Carting pipes 2 miles, at 3*s.* per 1000 ... ... ... | 0 | 4 | 6 |
| Cutting drains, laying pipes and filling 88 rods at 6*d.* per rod ... ... ... ... ... ... ... | 2 | 4 | 0 |
| Sorting stones, breaking and putting in, or collecting them from the land when the farmer had gathered them in o heaps, and putting in 30 yards at 3*d.* No carting ... ... ... ... ... ... ... | 0 | 7 | 6 |
| | £4 | 0 | 8 |

Perhaps you may doubt this expenditure; I shall therefore take the liberty of copying Mr. Scott's statement, printed in the *Devizes and Wiltshire Gazette* of Jan. 23d, 1851, what he is expending per acre on the Grittleton estate, near Chippenham, the property of Joseph Neeld, Esq., M.P.

| | £ | s. | d. |
|---|---|---|---|
| Drains 4 feet deep, 36 feet apart, 1¾ inch pipes, 1210, at 17*s.* 6*d* per 1000 ... ... ... ... ... | 1 | 2 | 2 |
| Digging, breaking, and filling stones, 24 cubic yards, at 9*d* per yard ... ... ... ... ... ... | 0 | 18 | 0 |
| Cutting and laying pipes and stones, and refilling soil, 18.33 chains, at 2*s.* 3*d.* ... ... ... ... ... | 2 | 1 | 3 |
| | £4 | 1 | 5 |

If "A.R." will take the trouble to obtain the paper and read Mr. Scott's lecture, he will see that he is both a scientific and practical man, and will also learn that he is executing 3 miles of draining per day. *Fossa.*

## Societies.

### ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held at the Society's House in Hanover-square, on Wednesday, the 26th of February; present, Mr. Pusey, M.P., Trustee, in the chair; Earl of Essex, Lord Wharncliffe, Hon. R. H. Clive, M.P., Hon. Dudley Pelham, M.P., Rt. Hon. Sir Thomas Frankland Lewis, Bart., Rt. Hon. T. F. Kennedy, Sir Robert Price, Bart, M P., Mr. B. Almack, Mr. Baker (Writtle), Mr. D. Barclay, Mr. T. Raymond Barker, Mr. Hodgson Barrow, M.P., Mr. Bastard, Mr. Bethell, Mr. Beale Browne, Rev. T. C. Browne, Capt. Wentworth Buller, R.N., Mr. Burke, Mr. Burton, jun, Dr. Calvert, Colonel Challoner, Mr. Charlesworth, Mr. Christopher, M.P., Mr. Clavering, Mr. Evelyn Denison, M.P., Mr. Dewing, Mr. Druce (Ensham), Mr. Druce, jun., Mr. Dyer, Mr. Ferrabee, Mr. Fuller, M.P., Mr. Fisher Hobbs, Rev. C. E. Keene, Mr. Lakin, Mr. C. Lawrence, Mr. Loft, Mr. Long, Mr. Maddison, Mr. Majendie (Hedingham Castle), Mr. Neill Malcolm, Mr. Marshall, M.P., Mr. Miles, M.P. (Leigh Court), Mr. Moody, Mr. Ralph Neville, M.P., Mr. Nicoll, Mr. C. E. Overman, Mr. Parkins (Chesfield Lodge), Mr. H. Parish, Mr. T. Paynter, Mr. Pelly, Mr. Pendarves, M.P., Mr. Rice, M.P., Mr. Sanford (Nynehead), Prof. Sewell, Mr. R. N. Shawe, Mr. Slade, Mr. Slaney, M.P., Mr. S. R. Solly, Mr. Stansfield, M.P., Rev. T. Stevens, Mr. Strafford, Prof. Way, Mr. Wight, and Mr. Wilson (Stowlangtoft).

The following new members were elected:—

Macartney, George, Lissanore, Co. Antrim, and Bourton, Warwickshire.

Spooner, Thomas, Abbot's-Bromley, Rugeley, Staffordshire.

Boyer, J., Skeffington Vale, Leicester.

Fowler, Robinson, Preston Hall, Stockton-on-Tees.

The names of nine candidates for election at the next meeting were then read.

### DISCUSSION ON FLAX.

I. Cultivation of the Flax Crop.—Mr. Beale Browne, of Hampen, near Andoversford, Gloucestershire, at the request of the chairman, favoured the Council with the result of his experience in the growth of Flax. He had been one of the first members of the Society to call the attention of farmers to the cultivation of Flax, which he believed to be the paying crop; and having become acquainted with what had been done in Belgium and Ireland, he had for the last 7 years devoted his attention to the conditions under which the growth and management of Flax, in this country, might be carried on in the most economical and successful manner. In Warwickshire, his friend Mr. Gregory Watkins, the High Sheriff of that county, on being informed of the results to be obtained from Flax culture, had called the farmers in his neighbourhood together, and formed them at once into a local association for the purpose of consulting together on the best mode of proceeding in adopting the Flax crop, and of aiding each other by arrangements tending to their common advantage. Mr. Browne then proceeded, at the suggestion of Mr. Miles, M.P., to state, under the following heads, the result of his practical experience in the cultivation of Flax:—

Climate, Locality, Soil.—His land in Gloucestershire was hilly, and as variable in its character as the climate; it consisted of heavy clays, stonebrash, and sandy loams 2 feet thick. He believed that no soil, capable of growing anything was unsuited to Flax, provided it were moist and of fine tilth; in fact, that he would not hesitate to grow it on a common turnpike road, with a moist soil an inch thick; at the same time a depth of 3 feet was found to be most advantageous for the expansion of its roots. Sir Robert Kane had shown that it takes the least from the soil of any plant; and that, deriving, as it did, a large amount of its nutriment from the atmosphere, it was the least exhausting crop that could be put into the ground, provided the manure from the seed and refuse were retained on the land, and only the Flax fibre itself carried off; and Mr. Browne had reason to believe that this opinion was now entertained by all parties connected practically with the cultivation of the Flax crop. It grew best, Mr. Browne had found, on an old ley pasture; it also succeeded well after Wheat, or even Turnips; and the land might be laid down with Clover. In all cases, however, it was necessary to obtain as fine a state of soil as possible previously to sowing. In his own case, he gave the land a slight manuring for this crop.

Sowing, Weeding.—The first great thing, in Mr. Browne's opinion, was to get thoroughly clean seed, and he had been desired by his friend, Mr. A. Marshall, of Leeds, to press this point particularly upon the attention of the Council meeting of that day. Mr. Browne had himself suffered great loss by planting foul seed, from the additional expenses incurred in the consequent weeding, pulling, and after management. He had, however, at length, by great perseverance succeeded in cleaning his crop so effectually as to receive from the parties who had used his seed last year the most favourable account of its purity. Mr. Browne then placed before the meeting two samples of the seed he now employed. A week previous to sowing, or even on the very day of planting, Mr. Browne had been in the habit of employing a scuffler or breast-plough for the purpose of moving the ground and thus cutting up the weeds, a preliminary operation that he had found save much subsequent expense in weeding the after crop. The Flax was not so tender a crop as many persons had imagined, for some Flax seeds having been accidentally wasted and left on his ground after harvest, produced plants which stood well through the whole of the ensuing winter. He had found the first week in April the best time for sowing the Flax seed, and he preferred the broadcast system. He used an old seed wheel that had become too large for Clover, and covered the seed in the lightest way possible, with the finest light harrows had on his farm, taking care to cross the harrowing, so as not to pull it in rows. With regard to quantity of seed, Mr. A. Marshall preferred 3 bushels, but Mr. Browne considered 2½ bushels quite plenty, it being of course understood that the seed employed was of the best quality, and of the greatest purity. In reference to the young plant, he might remark that Flax was so speedy in its growth that nothing could overtake it. In dry seasons the straw would be short, and the seed abundant; in moist weather, the stalk would be longer but the seed scanty. The expense of weeding was trifling, not amounting to 2*s.* per acre.

Pulling, Stacking, Threshing, Produce.—At the end of July, or beginning of August, according to the situation, the Flax would be ripe and ready for pulling. The cost of this operation—of which the great secret was to leave the ends perfectly straight and the roots in a brush—had been variously estimated by different growers, according to circumstances; he thought 7*s.* or 8*s.* per acre too little, and 14*s.* too much. In his own case, he found that 12*s.* or 13*s.* was about the expense. If the land is laid down with Clover, it should be done directly the Flax is pulled; the sheaves should be put in rows, and the land between them rolled. He had found Clover good, except in years of great drought. The sheaves were tied evenly with Flax straw-bands, and were capped by drawing the bands near the roots of the plant, and thus causing the seed ends of the sheaves to spread out as a covering for the stalks; by this plan the rain was prevented from penetrating the sheaf. The Flax, after standing a fortnight or three weeks in the field, was then carted on a dry day to the barn or rick, until convenient to thresh it. In making his ricks, he placed a sack filled with chaff or straw in the middle of the plot on which they were to stand; and each rick being gradually made round this sack as a moveable centre piece, this was gradually pulled up as the work proceeded, an open space or flue within the body of the rick was left, which caused ventilation, and prevented that heating of the Flax so injurious to its quality, and to which it is so very liable, as he had found on one occasion to his great loss. Mr. Browne recommended that the ricks should be thatched as soon as possible. The threshing was performed in Mr. Browne's establishment by beetles; and the sheaves, instead of being untied and spread open, were kept in their bands, and beat first on one side, and then turned over on the other side and beat again. He recommended that the work-people should be particularly instructed to attend to this point, which they are apt to neglect. The expense of threshing with beetles was 7*d.* or 8*d.* per bushel. The produce of seed per acre had been variously estimated at from 16 to 24 bushels; he thought 20 bushels might be considered as a fair average of his own crop; and, as far as he could judge, 4 cwt. might be taken as the amount per acre he obtained of the dressed Flax. With regard to the Flax straw, some had thought that the farmers would be able to get 5*l.* per ton for it; but this estimate, he feared, would only mislead them; he felt quite certain that 3*l.* per ton was as much as they would generally get. On this point, as on all others connected with this important subject, his whole and sole object was to prevent parties who intended to try the cultivation of Flax from being misled in any way in their laudable endeavours to carry it on successfully, either in reference to the investment and improvement of their capital in this new crop, or to its employment among the labourers on their farms.

Mr. Samuel Druce, of Ensham, then favoured the Council with the result of his practical experience in the growth of Flax in Oxfordshire for the last few years. He called the attention of the Council, however, more particularly to the results of his last year's crop, which he had drawn out for the information of the members into a balance-sheet of expenditure in cultivation and realisation by sale of produce. He thought this statement would satisfactorily show to them the value of the Flax-crop, and the attention which under present circumstances it appeared to deserve. His property lay on the Oxford-clay formation; and the piece of ground on which the trial of cultivation to which he referred was made, consisted of a deep red loam, and in extent was 5A. 2R. 36P.

1.—Expenses of Cultivation.

| | £ | s. | d. |
|---|---|---|---|
| One ploughing, at 10*s.* per acre ... ... ... | 2 | 17 | 3 |

Leaving a net profit of 47*l.* 15*s.* 9*d.* on the 5A. 2R. 36P. (or a trifle more than 5⅜ acres) of land employed in this trial of Flax cultivation.

Mr. Druce concluded his statement by expressing his conviction that the Flax crop was not an exhausting crop at all; in fact, that his son had found a piece of Wheat after Flax one of the best Wheat crops he had grown. He thought at all events, that it would be found a good thing for every farmer to grow some Flax on his farm, if only for the purpose of working up his inferior hay, with a paste of Beans and Flax-seed, as food for his cattle. It may perhaps be interesting to add that Arthur Young some 50 years ago refers to the cultivation of Flax in Mr. Druce's neighbourhood, in the following terms: "Eight or nine years past there was a considerable quantity of Flax raised in Oxfordshire, at Watereaton, Hampton, and Yardington, in boggy land; and good Wheat got after it by Mr. Cocks, &c.; but at present there is none. A very singular husbandry, however, in this vicinity has been the culture of this plant for the object of seed, for the sole purpose of fattening bullocks: the high price of linseed-cake occasioned this management, which answered well. The Flax was watered, and dressed, as in the common way; but the object of the cultivation was the seed for live stock."

Mr. Sanford, of Nynehead Court, Somersetshire, then favoured the Council with some valuable remarks in reference to the cultivation of Flax in Somersetshire,

where that crop had been grown as long as he could remember, but its cultivation checked in consequence of prohibitions in the leases granted to the tenantry of that county. These prohibitions having been, and, as he thought, very properly, in many cases disregarded, he decided, when he came into possession of his own property some 30 years ago, that a modification should be made in the conditions of the leases granted to his tenantry, by which, in every 100 acres of land, 5 acres might be under cultivation with Flax, provided the seed were consumed on the land. It had become a standing proverb in Somersetshire, that good Wheat crops always followed Flax. He thought it would much promote the cause of Flax-growing in that part of the kingdom if the farmers could be persuaded to prepare for their own use and satisfaction such a balance-sheet in their respective cases as Mr. Druce had then laid before the meeting; as it was, they contented themselves simply with a knowledge of its value per ton. He attributed much of the discouragement which might arise in its cultivation to the precarious conditions connected with the steeping process. The bundles were laid in ponds of soft water, having neither inlets nor outlets, and were kept submerged by means of heavy weights placed on them; and so ticklish was the watering process, and so nice a point the crisis of the operation, that persons were set to watch the particular moment of completion, as a few hours or even minutes beyond the proper period might entirely prevent its success. The following remarks of Mr. Dyke Acland, on Flax cultivation in Somersetshire, may be interesting in this place. He says (Journal XII., p. 732): "The district is singularly favourable to the growth of Flax and Wheat, while neither the straw of the Wheat nor the seed of the Flax are consumed to any extent in the district as food for cattle, although the population is large—if not redundant, wages low, and the poor-rates high; and yet it is now generally admitted among good farmers that the judicious combination of the use of straw-chaff with linseed, either as jelly or cake, is one of the most economical ways of making large supplies of meat and manure, while at the same time house-feeding and Flax cultivation both increase the demand for labour. It is surely premature to talk of giving up the growth of Flax. Would it not be better to review the whole process of its preparation, and to inquire whether improvements which have been adopted in Belgium, Norfolk, and elsewhere, may not be imported into this district, and combined with the profitable feeding of cattle in addition to the sheep now folded on the land? If some leading proprietor would pick out an intelligent workman, and send him to visit the districts where the preparation of Flax has been most carefully attended to, he would confer a great benefit on his neighbourhood."

Lord Monteagle made an interesting statement of his own case in reference to the introduction of the Flax crop on his home farm, and at his recommendation on the farms of his tenantry in the south of Ireland. His lordship had been induced, however, more to restore the growth of Flax in that part of Ireland than to introduce it, as the cultivation had ceased on account of the want of markets for the produce. But as the progress of information from the north of that kingdom extended itself to the south, he was induced, at the time of the failure of other crops, when there was no longer any retting establishments or large manufacturers left in his neighbourhood, and the consumer and spinner were gone, to endeavour to bring about the restoration of the crop, and to try it then as the farmers were now about to do in England. He therefore set about its cultivation: he obtained the best seed from Mulholland of Belfast, and received printed instructions from the Flax Society; the Flax was grown on his home farm, and on the farm of his bailiff; his tenants, too, were induced to join in the cause, as well as Lord Devon and other influential landowners of the district. They all succeeded, grew good Flax, and the specimens received the favourable notice of the Flax Society, his lordship's sample being valued at 63*l.* only at that time, on account of the lowness of prices, but which would now fetch 100*l.* How, it would be asked, had the crop succeeded for the farmers? The notion of transporting at a great expense the Flax they had grown, in its rough state, offered an insuperable difficulty. If worked by hand, it must be done with all the skill and knowledge within their reach. In his neighbourhood there was no water-power, and he was unwilling to adopt steam-power until assured of a market for his produce. In short, his lordship's tenants sent all their Flax to him, and he had to buy it off their hands; so that he had at that time more stacks of Flax than of Wheat on his farm, and had no means of turning the Flax to account. If, like the English farmers, he could have availed himself of the scientific application within their reach, and been able to introduce economically either hand-power or machinery, he could then have obtained a market for his produce, and the Flax crop would have answered his purpose as a farmer. Some of the land he had planted with Flax had been previously rather exhausted, but by cultivating the Flax well, the land become better than any other on his estate: no meadow, indeed, yielded such capital Grass as that on which the Flax had been grown. The English farmers would enter on the cultivation of Flax with all the knowledge, capital, and established modes in the management of land, for which they are so pre-eminent; and his lordship, in conclusion, heartily wished them every success.

Mr. Fisher Hobbs thought the Council were deeply indebted to Lord Monteagle for his kindness in coming among them that day as one of the members of the Society, and for the candid manner in which he had detailed to them the origin, progress, and result of his attempt to restore the cultivation of Flax in the south of Ireland. That no market could be found for the produce grown on that occasion, was a fact which he thought must serve to instil caution into the proceedings of the English farmers. They had been told that if they lost their capital in corn, they would find plenty of capitalists in Leeds and the manufacturing districts to take the land off their hands. He would undertake to find for those gentlemen hundreds of acres in the eastern counties, for the growth of Flax, if they would ensure the certainty of a market for the fibre at a remunerating price.

M. J. de Cock Kenefecke, from Belgium, then addressed the meeting. It was an experienced fact, he believed, that Flax required a continual light moisture, such as prevails in Ireland and the Low Flanders; and the great part of England being similarly favoured by its surrounding waters, offered a strong presumption, in his opinion, that the Flax crop must succeed throughout the kingdom. The English farmer might thus, he thought, with confidence expect the following advantages, differing in some respects from those of the Flemish farmer:—

1. A valuable crop of Flax.
2. A good cattle food in autumn from the Clover or Carrot crop.
3. A genuine article for cattle food in winter from his linseed meal.
4. A good market for the oil produced from his seed.
5. An excellent soil for winter crops.
6. The satisfaction of affording relief to the labouring classes.

He then advocated the preparation in England of coarse Flax, to be employed in Flanders for Russian duck fabrics, the sowing of Clover with Flax on a brown soil, and the particular manure required for such crops.

II. Preparation for Manufacture.—Mr. Beale Browne thought it would be well for the public generally, as well as for the owners, and tenant-farmers more especially, to come to no hasty conclusion on any of the new systems of Flax management proposed for their adoption, however plausible such systems may on their first presentation appear to them; but in this pursuit, as in that of higher objects, to "prove all things," and only "hold fast that which is good." The separation of the seed capsules from the stalk, the woody part from the Flax-fibre, the Flax-fibre from the glutinous matter, and also the Flax-fibres themselves from each other, were all important practical objects, for the attainment of which various modes had been proposed, differing from each in efficiency, economy, and the circumstance of greater or less injury, or otherwise, to the Flax-fibre for manufacturing purposes. Mr. Browne preferred the hot water system of steeping to any of the former modes, as it was not only the cheapest, but fell in with the regular routine of business, summer and winter, and could be carried on by the same hands. The removal of the woody part from the Flax-fibre, by chemical means, was easy to be accomplished, and had long been effected by Professor Faraday, and other chemical friends of Mr. Browne; but in no case, that Mr. Browne was aware of, in which the Flax-fibre did not suffer injury from such chemical means, and become weak and rotten. Whatever M. Claussen's plan might then be, he feared that he had yet to surmount that difficulty, by employing only such chemical agents as will effect the separation required without injuring the strength of the Flax-fibre, or the yarn into which it is spun. To assure himself of the weakness of M. Claussen's yarns, he had sent for a sample to the mill at Rochdale, where M. Claussen's processes are carried on; and this yarn, which he then exhibited to the members, along with a specimen of cloth woven from it, would be found deficient in the strength required, and inferior to that possessed by the ordinary cotton yarns. Mr. Browne remarked, that in mixing Flax and cotton together, it was necessary to cut the Flax fibre short, and by chemical means nearly to destroy that fibre before it is sufficiently tender to mix with cotton; and then, with the same-sized yarn, there would accordingly be nearly two parts of cotton to one of Flax in any cloth manufactured from Flax-cotton, as the Flax it contained would be about as heavy again as the cotton. He therefore conceived that, as all cloth is sold by weight, the saving would not be so much an object gained by this mixed fabric. He also thought that M. Claussen's manufactured specimen should be examined in cloth, like calico or linen, not in ribbed fabrics, like stockings, which afforded no test of excellence. Mr. Browne, and a friend of his, had succeeded in their attempts to separate the fibres of Flax from each other to such a degree as to confer on the Flax the character and qualities of cotton; but by all the processes they had tried, the Flax-fibre had become weakened and rotten. They found that

No. 16 thread, half foreign cotton with half British cotton, 120 yards long, weighed 83 grains;
No. 16 thread, all foreign cotton, 120 yards long, weighed 56 grains;

and therefore concluded that it would take one-third more of Flax-cotton mixture to make the same surface of cloth, and to make it badly, than of foreign cotton alone. The cloth woven from No. 16 thread, half foreign cotton and half British cotton, had the appearance of the cloth employed for sieves and strainers. He made these remarks in perfect sincerity, and with no other motive than that of obtaining the truth, and of wishing it to prevail; for should M. Claussen's plan, when perfected, prove to be a better one than the hot-water system he had himself adopted, he would not hesitate to lay that system aside, and try to get from M. Claussen a license for the use of his patent, and its introduction into his own establishment at Hampen.

Claussen's Process.—The Chevalier Claussen (attended by Dr. Ryan, Dr. Bright, Mr. M'Dermott, Mr. Graves, and Mr. J. S. Christopher), then presented himself before the Council, agreeably with his engagement on that day fortnight previously, to lay before the members a statement of his process for converting Flax into a substance having similar properties to cotton for manufacturing purposes, and for improvements in the bleaching of vegetable productions, and of textile fabrics composed of such productions. M. Claussen having laid on the table a copy of the "Specification" at length of these patented processes (as contained in the "Mechanics' Magazine," No. 1437, published a few days previously, and to which we refer for the convenience of those of our readers who may wish to consult that document in detail), requested Dr. Ryan to explain for him to the Council the nature and bearing of the processes in question.

Dr. Ryan commenced his address to the meeting by stating that since the subject of the Chevalier's invention had been brought before the Council, he had been down to Bradford, for the purpose of witnessing, on a large scale, the practical operation of M. Claussen's plan, and he should now have much pleasure in detailing the results of his observations. Dr. Ryan begged also to remark that he was not there for the purpose of finding fault with any of the existing processes for preparing Flax fibre, but merely, as the Chevalier's chemical advocate, to point out to the Society the advantages of what he might be allowed to term a most beautiful discovery. Before, however, he proceeded further he would take the liberty of answering at once an objection made by Mr. Beale Browne, that it would be impossible to mix Flax cotton, or fibre, with common cotton, because of the difference in the specific gravity of the two; that Flax would make cotton goods heavier. This was Mr. Browne's objection; but Dr. Ryan could inform him that, although Flax fibre, in its usual state, was specifically heavier than cotton, yet, when prepared by Chevalier Claussen's plan, it became exactly of the same gravity as American cotton. He then proceeded to detail the operations at the works of Messrs. Quitzow and Co., at Apperley-bridge, near Bradford, Yorkshire. He described the process of preparing the straw for scutching as one which only occupied four hours, instead of five days—the shortest period under even the patent of the late Mr. Schenck, the one now patronised by the Royal Flax Society of Ireland. The materials employed by M. Claussen were merely soda and sulphuric acid, and these in such a form and in such quantities as not to injure the most delicate fabric. Thus the proportion of soda was only one part in 200 parts of water. The acid was added after the straw had been boiled with the soda; and the objections to the employment of such a substance would be overcome by remarking that the proportion of the acid was only one to 500 of water, and that the soda present in the straw neutralises the whole of the acid, and forms a neutral salt—sulphate of soda. Dr. Ryan then proceeded to state that means had been adopted to ascertain the strength of fibre thus prepared, in comparison with that prepared by Schenck's process, and the result was highly satisfactory. In the next place Dr. Ryan explained the process of cottonising the Flax, or in other words, of splitting its fibre, and converting it into a material which could scarcely be distinguished from the finest American cotton. This he considered the most beautiful and useful portion of the discovery, opening, as it did, a new market to the flax grower, and enabling the manufacturer to spin it on any machinery hitherto employed for cotton, silk, or wool. Dr. Ryan then detailed the process itself, pointing out the elastic force of the carbonic acid gas liberated in the tubes of the Flax fibre by the action of an acid on the carbonate of soda, or of potash. He also stated that he came prepared to show to the meeting, practically, by experiment, the processes of splitting and of bleaching—experiments which would render the matter intelligible to every one present.

At this moment Dr. Ryan handed to Professor Way, the consulting chemist to the Society, a copy of Chevalier Claussen's specification; and it may be stated that in a few moments the Professor returned to the Council-room, and remarked that he had just himself tried the experiments according to the directions of the inventor, and had perfectly succeeded in splitting and bleaching some Flax fibre. It was therefore suggested to the Chairman by Dr. Ryan, that as Professor Way was a perfectly disinterested party, it would be better for him to operate before the meeting. This Professor Way did most successfully, bleaching and splitting a quantity of Flax in the course of about two minutes.

Although we have long been practically familiar with the expansive effects of aëriform fluids suddenly disengaged chemically from an apparently solid and inert substance like gunpowder, either in fire-arms or the blasting of rocks, and with their elastic recoil when released from the pressure of condensation, as in the air-gun or the liquid gases of Dr. Faraday, we were not prepared for so beautiful an instance of the application of this principle as the one Chevalier Claussen has given us in the splitting of vegetable fibre, by conveying into its interstices the carbonic acid gas concealed in condensation and chemical alliance with soda, and then setting it free by the addition of acid, which breaks off that alliance by its own superior elective affinity for the alkali. Means shown in their result to be so powerful,

and in their operation so gentle yet decisive, gave to the simple experiment made in the presence of the Council by Professor Way, more the air of a new instance of Natural Magic than the sober reality of an ordinary operation of natural laws, of which the application only was novel; and its effect on the meeting was accordingly both singular and striking, occasioning evident marks of their agreeable surprise and admiration at the result obtained. The Flax fibre soaked in the solution of sub-carbonate of soda was no sooner immersed in the vessel containing the acidulated water than its character became at once changed, from that of a damp rigid aggregation of Flax to a light expansive mass of cottony texture, increasing in size like leavening dough, or an expanding sponge. The change was no less striking, when this converted mass in its turn was placed in the next vessel which contained the hypochlorite of magnesia, and became at once bleached, attaining then the colour, as it had just before received the texture, of cotton.

After the performance of this experiment, a very lengthened and interesting conversation ensued between the Chairman and Council on one side, and M. Claussen and the parties connected with Flax culture and management on the other, on various topics, among which were —the point to which farmers, who were inclined to grow Flax, would have to proceed to render their produce in a fit state to be taken off their hands by M. Claussen or his agents; the 10*l.* machine of Mr. Davy, of Crediton, for reducing the bulk of Flax to be worked by hand; the machinery for cutting the Flax into proper lengths; the difference between the flat fibre of cotton and the tubular fibre of Flax; on the relative strength of the two fibres; on mechanical preparation of Flax without steeping, by Mr. Davy; on specimens of Flax grown from prepared seed, and on the treatment of Flax for the stronger purposes of manufacture, without steeping, by Mr. Donlan; Mr. Christopher, M.P.'s report of Mr. Bright's opinion of Flax-cotton, and its probable employment, to a considerable extent, should the price of foreign cotton remain as high as it then was; his reference to experiments carrying on at Manchester, to caution on the subject, and the inconvenience of inequality in length of fibre; M. Claussen's opinion that by mechanical means Flax will never be brought into the state of cotton; on a Flax coat, manufactured at Mr. Browne's establishment, in which the Flax yarn or cordage was so arranged as, by its swelling and torsion, when exposed to rain, to render the cloth compact and impervious to further penetration of wet within its substance.

III. Royal Flax Society of Ireland.—A deputation from the Royal Society for the Promotion and Improvement of the Growth of Flax in Ireland waited upon the Council for the purpose of aiding the Royal Agricultural Society of England in their consideration of the agricultural bearings of Flax culture, by offering to them whatever amount of experience the Flax Society had gained, during the ten years' period of its establishment, in the growth and management of that crop, and preparation of the produce for manufacturing purposes. The deputation consisted of the Earl of Erne, Lord Monteagle, Lord Naas, Sir James Stronge, Bart., Sir R. A. Ferguson, Bart., M.P., Mr. J. G. Marshall, M.P., Mr. Conolly, M.P., Mr. Russell, and Mr. Macadam; and having presented to the Council, for the use of the members, a supply of copies of the seventh and tenth Reports of the Royal Flax Society, they informed the Chairman that their secretary, Mr. Macadam, would, with his permission, read to the Council a statement relative to the culture and preparation of Flax, signed by their President, the Marquis of Downshire.

The Chairman expressed the great pleasure it gave him to receive, on the part of the Council, the deputation who had on that occasion favoured them with their attendance. The valuable labours of the Flax Society were well known and appreciated throughout the United Kingdom; and Mr. Macadam's excellent Prize Essay on Flax, in the Journal of the Royal Agricultural Society of England, did him great honour, and was often referred to by the Chairman, with pleasure and satisfaction.

The Chairman then desired Mr. Macadam to proceed in reading the statement to which reference had been made by the deputation. As this document has already been printed for circulation, it will only be necessary, in this place, to enumerate its leading points:—

1. That although established especially in reference to the cultivation of Flax in Ireland, it has always considered the question a national one, affecting the whole of the British Empire.
2. That the Society feels anxious to make its long experience and practical knowledge available in directing those who have now become aware of the importance of the subject.
3. That it may be useful, at the present time, to refer to a few leading facts connected with the history of the Society and its operations.
4. That the Society had with much surprise observed attempts lately made, by interested parties, to impugn its motives and decry its utility.
5. That the present occasion should be made available to show the injustice of those aspersions, to set agriculturists right upon points where they may have been led astray, and to urge a timely caution on those who may be carried away by plausible but unfounded statements to attach too much weight to speculative projects.
6. That the Flax Society express their hope that M. Claussen's sanguine anticipations may be realised.
7. That a notice should be taken of a few of the most important points on which erroneous information has recently been conveyed.
8. That all members of the Royal Agricultural Society of England disposed to cultivate Flax should be strongly recommended to adopt, in the first place, the most approved method now practised in Ireland, and to prepare their produce for the great and certain market offered by the linen manufacture.

On the motion of Colonel Challoner, seconded by Mr. Parkins, the thanks of the Council were voted to the Royal Flax Society of Ireland, for the favour of the statement they had then communicated to them, and the cordial co-operation they offered to the Royal Agricultural Society of England in promoting the successful cultivation of the Flax crop in England.

Among the visitors present at this meeting were, M. F. Demann, a distinguished cultivator of Flax in Belgium, introduced to the Council by Mr. Marshall, M.P.

Communications on Flax culture were received from Mr. J. Hill Dickson and Mr. Edward Oliver, and reserved for consideration at a future meeting.

The Council then adjourned to their monthly meeting on Wednesday.

---

A Monthly Council was held at the Society's House, in Hanover-square, on Wednesday last, the 5th of March; present, his Grace the Duke of Richmond, K.G., President, in the Chair; Lord Southampton, Lord Portman, Sir Charles Lemon, Bart., M.P., Sir John V. B. Johnstone, Bart., M.P., Mr. T. Raymond Baker, Mr. Brandreth (Houghton House), Mr. Burke, Colonel Challoner, Mr. Brandreth Gibbs, Mr. Grantham, Mr. Jonas, Mr. Kinder, Mr. Marshall, M.P., Mr. Milward, Mr. Pendarves, M.P., Mr. Sanford (Nynehead Court), Prof. Sewell, Mr. Shaw (London), Mr. Villiers Shelley, Prof. Simonds, Mr. D. Simpson, Mr. Stansfield, M.P., Prof. Way, Mr. Jonas Webb, and Mr. Wilson (Stowlangtoft).

John Villiers Shelley, Esq., of Maresfield Park, Sussex, was elected a Governor of the Society.

The following new members were elected:—

Savignon, Don Domingo, of Mexico
Pierson, James Alexander, The Guynd, Arbroath, Forfarshire
Hogg, Frederick, 40, St. James's-street, London
Bridson, Henry, West Bank, Bolton-le-Moors, Lancashire
Spencer, T. S., Hinckley, Leicestershire
Elmsall, Mansfeldt de Cardonnel, Woodlands, Doncaster
Hall, Alexander Hall, Watergate, Emsworth, Hampshire
Hopkins, W. H., Fairmile, Henley-on-Thames
Parish, Henry Headly, Chesham-street, Belgrave-square.

The names of nine candidates for election at the next meeting were then read.

Finances.—Mr. Raymond Barker, Chairman of the Finance Committee, laid before the Council the report on the accounts of the Society to the end of the previous month; from which it appeared, that the current cash-balance in the hands of the bankers, at that time, was 2571*l.* (including 749*l.* received on the life-composition account). The Chairman then laid on the table, for the information of the Council, the quarterly statement of income and expenditure, funded property, and liabilities. This report was adopted and confirmed.

Essays.—Mr. Pusey, M.P., Chairman of the Journal Committee, transmitted to the Council a report on the essays sent in to compete for the prize offered by the Society in that department, on the Farming of Northamptonshire, the Diseases of Farm Horses from mismanagement, Diseases of Cows and Sheep after parturition, the Production of Butter, Agricultural Chemistry, and the Agricultural Geology of England and Wales. Many of these essays were of an interesting character and elaborate in their details. The whole were referred, as usual, to the Journal Committee, for adjudication.

Hampton Court Meeting.—Lord Portman reported to the Council the satisfactory progress of the General Middlesex Committee in their consideration and carrying out of the details referred to them by the Council, connected with the preparations for the ensuing Country Meeting of the Society, to be held in Bushy Park, in July next. The last day for receiving entries for the Society's Show of Live Stock for breeding purposes, to be held in that Royal Park, by Her Majesty's Gracious permission, would be Saturday the 17th of May, next.

Veterinary Grant.—On the motion of Lord Portman, seconded by Mr. Shaw, the sum of 200*l.* was voted to the Royal Veterinary College, as a grant for one year; for the purpose of aiding that Institution to carry out one of the original objects of the Society; namely, "The improvement of the veterinary art, as applied to cattle, sheep, and pigs."

Trustee.—On the motion of Mr. Brandreth, seconded by Mr. Villiers Shelley, Colonel Challoner was unanimously elected one of the Trustees of the Society, in the place of Sir Francis Lawley, Bart., deceased.

On the motion of Mr. Raymond Barker, seconded by Mr. Stansfield, M.P., Mr. Pendarves, M.P. was elected to fill the vacancy in the general body of the Council occasioned by the loss of Sir Francis Lawley.

The Council then adjourned to their weekly meeting, on Wednesday next, the 12th of March.

## Calendar of Operations.

### MARCH.

Central Yorkshire: *Kirk Deighton, March* 1.—The farming operations in January and February differ so little, that we have combined the two together in one report. Since the commencement of the new year we have had no pretensions to winter; although the fall of rain has been considerable, still it cannot be called great for the season; the temperature has been mild, and we have scarcely had a frosty night or seen a flake of snow since 1850 bid us adieu. On good land the Grass is beginning to freshen. Wheat also, on dry light lands, is looking well, but not what may be termed winter-proud. With us spring sowing has not yet commenced, but owing to the open weather we have a considerable quantity of land ploughed and in readiness for operation at the proper season. On account of the rain before spoken of, the cattle have played havoc with the straw in the yards, consequently the threshing-machine has not been idle, but has yielded a continual supply of Wheat and Barley straw, which the humidity has rapidly decomposed. The markets for all kinds of grain have been very depressed throughout the season, prime samples of red Wheat selling at 4*s.* 6*d.* per bushel, and Barley as low as 26*s.* per qr. for good malting qualities. Our sheep have, up to the present time, continued to feed off the white Turnips, with an allowance of half a pound of Linseed cake per head per diem. With this our hogs are in a very forward condition, and are only waiting for the season to take off their wool, when they will be quite fit for the butcher, at weights up to 20 lbs. per qr. Throughout the last month the mutton trade has been better than during any of the preceding winter months, choice weights in wool having made 6*d.* per lb. Not so with the beef trade; it has continued to flag ever since the new year commenced. The markets have been heavily supplied with beasts, and the very best cutters have barely made 5*s.* 6*d.* per stone of 14 lbs., while inferior have scarcely reached 4*s.* 6*d.* The lean markets have been glutted with animals of every quality, and at ruinously low prices; good animals are from 15 to 20 per cent. lower than at the same time last year. Our lambing season has not yet commenced, nor do we expect it for a fortnight; the ewes are still on white Turnips, where they will remain till they begin to lamb; at no period do we remember them looking so healthy and full of condition. The pork and bacon trade was never known to be worse, and even at the extremely low price of inferior grain for feeding, porkers have been fed at a loss; consequently we have done very little in that way, but have sold our pigs out as storers, the market for which has been better than for fat ones. We have a dozen sows in the yards, which will commence farrowing the next month, and from which we expect a good stock for the stubbles and latter-end porkers. We have begun to open our stores of Swede Turnips for the use of the cattle in the yards; they have a good many rotten ones among them, not having kept so well as in former years. We are just commencing planting early Potatoes, and find the sets in good preservation; although in some kinds, Irish Cups especially, on opening the stores, we find a little of the disease. The markets are very steady. *J. S.*

## Notices to Correspondents.

"Gratten:" *Mr. Lamb* tells us the word means "stubble." And "Rowen" means "aftermath." What is the origin of these words?

Poultry: *Enquirer.* The circumstance of having five toes is not decisive against the purity of a cock claiming to be of the Cochin China breed. One would hardly decide against a hen whose eggs differed from those usually laid by her breed, from that circumstance alone; still we should not select such eggs for hatching. The early laying of pullets of different breeds can only be fairly compared by running birds against each other that were all hatched on the same day, and treated exactly alike during their growth.

Salt and Soot: *J. L.* They may each be good, and therefore it is probable that they will both be good. But we do not know of any good to be realised by mixing them. The sum of their effects separately will be equal to the amount of effect produced by them in mixture; 2 cwt. of salt, and 30 bushels of soot, may be a good dressing per acre. Apply broadcast in wet weather, after the young plant has appeared.

Small Farms: *E T.* "M. S." will refer to your case again next week. But he would wish to know what are the restrictions under which you labour. It is obviously impossible for us to answer your question about Mr. Mechi publicly. He has correspondence enough without any encouragement by us.

Spanish Fowls: *E E W.* The imported birds are something curious, and perhaps valuable. Will you do us the favour to write privately on the subject? *D.*

## Markets.

COVENT GARDEN, March 8.

Black Grapes have not altered since our last report; but white ones are a trifle dearer. Pine-apples fetch good prices, and the supply of good dessert Pears is limited. English Apples are scarce. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. A few forced Strawberries have made their appearance, but there is little demand for them. Vegetables of all kinds are abundant and good. The trade for French Beans and Cucumbers is improving. Carrots and Turnips are good in quality, and so are Potatoes. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1s. 6d. per pottle. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Tulips, Double Primroses, Cinerarias, Moss and Provins Roses, and the different kinds of spring bulbs.

FRUIT.

POTATOES.—Southwark, March 3.

The Committee report that notwithstanding the cold weather at the end of the past week, we have had no improvement in price, as the fresh arrivals have been more than equal to the demand. The following are the prices:—York Regents, per ton, 70s. to 90s.; Scotch do., 60s. to 70s; ditto Cups, 50s. to 70s.; Cambridgeshire and Lincoln Regents, 50s. to 75s.; French whites, 50s. to 60s.

HAY.—Per Load of 36 Trusses.

Smithfield, March 6.

| | | | | | |
|---|---|---|---|---|---|
| Prime Meadow Hay | 75s to 80s | | Clover ... ... ... | 70s to 80s | |
| Inferior ditto ... | 60 | 70 | Second cut ... ... | 63 | 70 |
| Rowen ... ... ... | 60 | 65 | Straw ... ... ... | 24 | 28 |
| New Hay ... ... | — | — | | J. Cooper. | |

The supply short, but quite sufficient for the demand.

Cumberland Market, March 6.

COAL MARKET.—FRIDAY, March 7.

Wallsend Haswell, 15s.; Wall-end Stewarts, 15s.; Wallsend Tees, 15s.; Wallsend Ridd ll, 13s.; Eden Main, 12s. 6d.; Hollywell Main, 14s.; Tanfield Moor, 13s.; West Hartley, 14s. —Ships at market, 307.

HOPS.—FRIDAY, March 7.

Messrs. Pattenden and Smith report that the market continues firm for all kinds of Hops with colour and quality.

SMITHFIELD, MONDAY, March 3.

In consequence of a small supply, the trade for Beasts is cheerful, at an advance of about 2d. per 8 lbs.; in a few instances our top quotation is exceeded. The number of Sheep is also small, and 4s. 8d. is in some cases given for choice Downs, yet too seldom to quote. Calves are plentiful enough, yet on the average we cannot quote higher. From Holland and Germany there are 351 Beasts. 900 Sheep, and 116 Calves; from Norfolk and Suffolk, 2000 Beasts; from Scotland, 300; and 300 from the northern and midland counties.

| Per st. of 8 lbs. | s | d | s | d | Per st of 8 lbs. | s | d | s | d |
|---|---|---|---|---|---|---|---|---|---|
| Best Scots, Herefords &c. | 3 | 6 | to 3 | 8 | Best Long-wools | 3 | 10 | to 4 | 2 |
| Best Short-horns | 3 | 4 | — 3 | 6 | Ditto Shorn | ... | ... | | |
| 2d quality Beasts | 2 | 6 | — 3 | 0 | Ewes & 2d quality | 3 | 2 | — 3 | 8 |

| | | | | | Calves | ... | ... | 3 4 | — 4 6 |
| | | | | | Pigs | ... | ... | 2 10 | — 3 8 |

Beasts, 3317; Sheep and Lambs, 18,780; Calves, 156; Pigs, 350.

FRIDAY, March 7.

The number of Beasts is very small, consequently Monday's quotations are freely given. We have a fair average supply of Sheep; trade is scarcely so active as on Monday, but prices are no lower. Calves and Pigs are plentiful, and it is with difficulty late rates are realised. Our foreign supply is very inconsiderable. From Scotland, we have 40 Beasts; and 75 milch cows from the home counties.

Beasts, 531; Sheep and Lambs, 3390; Calves, 240; Pigs, 300.

MARK LANE.

MONDAY, MARCH 3.—The supply of English Wheat to this morning's market was small, and disposed of rather more easily on the terms of this day se'nnight. Business in free foreign continues limited at late prices. The arrival of Polish Odessa cargoes on the coast for orders is probably the largest remembered; holders, however, decline at present to submit to an adequate reduction in price.—The value of Barley, Beans, Peas, and Oats remains unaltered, but the sale of the last is somewhat heavy to-day.—The Flour trade is not worse than last week.

| Irish | | — | — | 50 | 3540 | — | — |
| Foreign | | 1170 | 4230 | — | 16713 | 1350 | 150 |

FRIDAY, March 7.—The arrivals of grain, either English or foreign into this port during the week have been small, and having but a thin attendance of millers, business in Wheat was exceedingly limited, and prices must be considered nominally as on Monday.—We observe no alteration in the value of spring corn, with the exception of rather more firmness in Oats. —The prices of Flour remain as last quoted, with a moderate demand.

LIVERPOOL, TUESDAY, MARCH 4.—The supplies of grain and Flour from Ireland this week are small; those from foreign ports are rather large. No change has occurred in the value of any article during the week, at the same time we have experienced a general languid demand. The corn market this morning was again devoid of animation. The sales of Wheat were limited, and quotations remain precisely as on this day se'nnight. Barrel Flour was neglected, but French sack met a fair demand, without material change in the late value. Oats and Oatmeal were in moderate request, the former at full, but the latter at barely so good prices as on Tuesday last. Barley, Beans, and Peas were very little dealt in. There was a fair inquiry for Indian Corn, but it did not result in any extent of business, and prices stand unchanged. —— FRIDAY, FEB 28.—Supplies of Wheat and Flour still come freely from foreign parts, but principally from France, whence we have received since Tuesday about 3000 quarters of the former, and upwards of 7506 sacks of Flour. The market this morning was again dull, and Wheat and Flour were difficult to move, but there was no change in the prices of Tuesday. Indian Corn supported late rates, with a fair inquiry for shipments to Ireland. Barley, Beans, and Peas were unaltered in value.

GLASS FOR PIT FRAMES, HOTHOUSES, &c. in Boxes of 100 feet, 8s. 6d. each.

4½ by 3 ... 5 by 2½ ... 6 by 2½ ... 6 by 3½ inches.
4½ by 3 ... 5 by 3 ... 6 by 3 ... 6½ by 3
4½ by 3½ ... 5½ by 3 ... 6½ by 3 ... 6½ by 3½

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, Esq., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.

GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney, London, begs to solicit the attention of the gentry to his low prices for cash. Good substantial-built Greenhouses, fixed complete, 42 feet long by 13 feet wide, 90l.; 21 feet long by 13 feet wide, 50l.; 12½ feet long by 10 feet wide, 30l. A large assortment of Conservatories, Hothouses, Pits, Melon and Cucumber Boxes, Iron Hand-lights, Summer-houses, Seats, &c. Estimates in the above line, either in wood or iron.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

CUCUMBER and MELON BOXES and LIGHTS.

One hundred 1, 2, and 3 light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1l. 4s. Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom References given to the Nobility, Gentry, and the Trade, in most of the counties of England.—JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

NETTING, FLAGS, AND BUNTING.—Tanned Garden Netting, for protecting Fruit Trees from Frost, Blight or Birds; or as a Fence for Fowls, Pigeons, Tulip and Seed-beds, can be had in any quantity from JOHN KING FARLOW'S Fishing-rod and Net Manufactory, 5, Crooked-lane, London-bridge, at 1½d., 1 yard wide, 3d. 2 yards, or 6d., 4 yards wide. Woollen Bunting, any length or width, at 6d. per square yard. Forwarded to any part of the kingdom on receipt of remittance, Post-office order, or stamps. Several good second-hand Flags to be sold cheap.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c

PERMANENT PASTURE.

HENRY ROGER SMITHE, of Eastling, Faversham, Kent, informs the Public that his mixtures of the Natural Grasses and small Clovers—excluding no sort which is proper to form a PERMANENT PASTURE, as the soil &c. may direct—are now ready; delivered on the railway free of charge, at 1l. per acre, allowing 3 bushels as seed for an acre; also Lawn Mixtures, and the sorts separate. They are gathered under his immediate superintendence, and are quite new; this unprecedented low price last year, and the prospects of agriculture, having created an unlooked-for demand.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY,
Incorporated by Act of Parliament, 12 and 13 Vict., c. 91.

*Directors.*

HENRY KER SEYMER, Esq., M.P., Hanford, Dorset—Chairman.
JOHN VILLIERS SHELLEY, Esq., Maresfield Park, Sussex—Deputy-Chairman.

| | |
|---|---|
| John C. Cobbold, Esq., M.P. | Edward J. Hutchins, Esq., M.P. |
| William Cubitt, Esq. | Samuel Morton Peto, Esq., M.P. |
| Henry Currie, Esq., M.P. | Colonel G. A. Reid, M.P. |
| Thomas Edward Dicey, Esq. | William Tite, Esq., F.R.S. |
| William Fisher Hobbs, Esq. | William Wilshere, Esq. |

The Company is empowered to execute—1. All works of Drainage (including Outfalls through adjoining Estates), Irrigation, Reclaiming, Enclosing, and otherwise improving Land.

2. To erect Farm Homesteads, and other Buildings necessary for the cultivation of Land.

3. To execute Improvements, under contract, with Commissioners of Sewers, Local Boards of Health, Corporations, Trustees, and other public bodies.

4. To purchase Lands capable of Improvement, and fettered by restrictions of Entail, and having executed the necessary works, to resell them with a title communicated by the Company's Act.

All owners of Entailed Estates, Trustees, Mortgagees, Corporations, Incumbents, Life Tenants, and other persons having only limited interests may obtain the use of the Company's powers to carry out every kind of permanent Improvement, either by the application of his own or the Company's funds, secured by a yearly charge on the property improved.

Proposals for the execution of Works to be addressed to 52, Parliament-street, London. WILLIAM CLIFFORD, Secretary.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers: Office, 70, Strand, London.

REGISTERED ROLLER MILL for Crushing Linseed, Oats, Malt, Barley, &c., and Breaking Beans and Peas. Manufactured by E. R. TURNER AND CO., late HURWOOD and TURNER, St. Peter's Foundry, Ipswich.

E. R. TURNER and Co. claim for their registered Roller Mill the particular attention of Agriculturists Housekeepers, and others. Besides accomplishing all the purposes of the well-known Roller Mill for crushing Corn and Seeds, by an entirely novel arrangement it is made to break Beans and Peas most effectually, and without involving any delay in adapting the Mill from one process to the other. They are very simple in construction, and therefore not liable to get out of repair; may be worked with ease by one man, and for efficiency and cheapness are superior to any Implement of the kind yet manufactured. Price complete, 9l. 9s.

E. R. T. and Co. also manufacture a Roller Mill for Crushing only, of the same size as the Registered Roller Mill, and a larger Mill, for which HURWOOD and TURNER were awarded the Royal Agricultural Society's Prize at Norwich in 1849.

Price of Small Roller Mill ... ... ... £7 10s.
,, Norwich Prize Mill, for Horse, Steam, or Hand Power ... ... ... 10 10

Delivered Free to London, Norwich, Bury St. Edmunds, and all intervening Stations. To Hull by water, and all places within 50 miles of Ipswich.

A Discount of Five per cent. allowed for cash payments.

## *SALES BY AUCTION.*

FINAL SALE.—SOUTHAMPTON.
TO GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS ENGAGED IN PLANTING.

MESSRS. PROTHEROE AND MORRIS are instructed to submit to an unreserved sale, by Auction, on the premises, Page's-hill and Sidford and Above-bar Nurseries, Southampton, on TUESDAY, March 11th, and following day, at 11 o'clock, the whole of the remaining NURSERY STOCK, consisting of Evergreens, Ornamental Fruit and Forest Trees, Stove and Greenhouse Plants; together with six 2 and 3-light Boxes, Chaise Harness, Garden Pots, Flower Seeds, &c.—May be viewed, and Catalogues had, one week prior to the sale, on the premises; of Mr. BROOKS, 24, Portland-street, Southampton; at the principal Inns in the neighbourhood; Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction at the Mart, Bartholomew-lane, on THURSDAY, March 13, 1851, at 12 o'clock, a first-rate Collection of CARNATIONS, PICOTEES, and PINKS; also Standard and Dwarf Roses, Lancashire Gooseberries, Dahlias in dry roots, &c., the property of Mr. Wilmer, of Sunbury. May be viewed the morning of Sale; Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed to offer to public competition by Auction, at the Mart, Bartholomew-lane, on FRIDAY, March 14, at 12 o'clock, about 200 choice DOUBLE CAMELLIAS, ranging from 2 to 5 feet, well set with bloom buds; a selected assortment of Standard and Dwarf Roses and American Plants, comprising fine Hybrid Rhododendrons, Ghent Azaleas, Andromedas, &c., together with a choice collection of Dahlias in dry Roots.—May be viewed the morning of sale. Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

DALSTON NURSERY.

Household Furniture, a splendid collection of Prints, in Maple Frames, Books, China, and Glass. A capital eight-day Clock, Counting-house Fittings, Iron Safe, &c.

MESSRS. PROTHEROE and MORRIS are instructed by the Administrator of the late Mr. John Smith to submit to public competition, by Auction, on the premises, Dalston Nursery, Middlesex, on TUESDAY, March 18, 1851, at 12 o'clock, the genuine HOUSEHOLD FURNITURE, consisting of Brussels Carpets, sets of Chairs, Spanish Mahogany Four-post and other Bedsteads, Goose Feather-beds, and Bedding, Chests of Drawers, Sofa, Mahogany, Loo and other Tables, Chiffonier, Barometer, &c. The erection of Sheds, a capital Four-wheel covered Van, Tumbrel Cart, and sundry effects.—May be viewed one day prior to the sale, and Catalogues had of the principal Seedsmen in London; on the premises; and of the Auctioneers, American Nursery, Leytonstone, Essex.

FOR EXHIBITION.

Specimen Cape Ericas, Epacris, Camellias, Azaleas, New Holland Plants, First-rate Geraniums, Hot-house Plants, &c.

MESSRS. TAYLOR AND SON, UPHOLSTERERS and AUCTIONEERS, 49 Coney-street, York, have the honour to announce to the Nobility, Ladies, Gentry, and Public generally, that, in consequence of Mr. THOMAS JACKSON going abroad, they have received instructions from Messrs. JACKSON and Co., Nurserymen, Scruton, Bedale, to sell by Auction, at their Nursery, and without reserve, on WEDNESDAY, the 19th day of March, 1851, their immense and magnificent Collections of EXOTICS, rare HARDY CONIFERÆ, and Scarlet HIMALAYAN RHODODENDRONS. The Coniferæ are very handsome specimens (all from Seed, in pots), especially the Cryptomerias, the Deodaras, the Abies Douglassii, and a Californian Pinus, with foliage 11 inches in length. To persons beautifying their Hothouses, Greenhouses, Conservatories, Parks and Pleasure Grounds such an opportunity rarely occurs. Messrs. T. and SON can with confidence state that this is the grandest Collection they have ever had the honour to announce for sale. Catalogues will be ready on the 12th inst., and may be had on application to the Auctioneers, or to Messrs. JACKSON and Co. The whole of the Plants will be on view on Monday and Tuesday prior to the day of sale. The sale to commence precisely at 10 o'clock, A.M., on Wednesday the 19th of March, 1851.

N.B. The Scruton Station, on the Bedale Branch, York, Newcastle, and Berwick Railway, is only five minutes' walk from the Nursery.

Auctioneer's Office, 49, Coney-street, York.

MR. HASLAM begs to inform the public that, in consequence of the non-arrival of the steam-boat, the CAMELLIAS, ROSES, &c., advertised for sale on the 6th and 7th inst., is postponed till TUESDAY and WEDNESDAY, March 11th and 12th, when they will be sold, without reserve, at the Auction Mart. Catalogues may be had at the Mart, and of the Auctioneer, Epping.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

FARM IN HAMPSHIRE.

TO LET, a Good STOCK FARM, of about 484 acres, of which 24 acres are Water Meadow, 55 acres dry Pasture, and the remainder Arable. The Poor Rates are very low, and the Tithe amounts to about 4s. 6d. per acre. The Farm adjoins the Great London Road, and is four miles from the Andover Road Station. No applications will be received unless accompanied with satisfactory references.—For particulars, apply to Mr. HUGH RAYNBIRD, Laverstoke, Andover Road, Hants.

TO NURSERYMEN, FLORISTS, MARKET GARDENERS, AND OTHERS.

TO BE LET, with immediate possession, in Surrey, a capital walled NURSERY, of about four acres, with two Dwelling-houses, eight Greenhouses, about 50 Boxes and Lights, stocked with the most approved Plants for Covent Garden Market.—Further particulars may be had of PROTHEROE and MORRIS, American Nursery, Leytonstone, Essex.

NORTHAW, HERTS.

TO BE LET, from Michaelmas, 1851, NYN FARM, situate at Northaw, comprising an excellent Farm-house, with convenient Outbuildings, and 220 acres of Land, of which about 82 are Arable, and 138 Meadow Pasture and Homestead. The Farm is wholly exempt from tithes or tithe rent-charges, and the parochial rates are very moderate. Northaw is situate near to Potter's Bar, on the line of the Great Northern Railway four miles from Barnet and Hatfield, six from Cheshunt, and nine from Hertford. To view the Farm, apply to Mr. James, Dredge, Northaw, and for particulars and to treat for the same, to Messrs. ATTWOOD and RIGDEN, the Close, Salisbury.

FARMS AT STANTON FITZWARREN, NEAR HIGHWORTH, WILTS,
And within about four miles of the Swindon and Shrivenham Stations, on the Line of the Great Western Railway.

To view the Farms, and for further particulars, apply at Stanton House, near Highworth, Wilts. Sealed Tenders to be sent, addressed to the Rev. J. A. TRENCHARD, at the same place, on or before the 25th March next.

March 8.

EXCELLENT OPENING FOR A NURSERY AND SEEDSMAN.

TO BE LET.—The Nursery Lands of Rosemount, lying within the Burgh of Maxwelltown, contiguous to the town of Dumfries extending to upwards of eight acres, with the large Dwelling-house, Seed Shop, Vinery, Greenhouse, &c. The Lands contain every variety of soil suitable for Garden purposes, were all trenched to the depth of four feet by the late Proprietor, are nearly surrounded by Stone Walls, covered with Fruit Trees, and there is, on one portion of the Grounds, a choice collection of Standard Fruit Trees and Gooseberry Bushes, in full bearing. The Seedlings may be had at valuation and entry immediately. Such an opening for an enterprising tenant seldom occurs, Dumfries being well known as one of the best situations in Scotland for doing a large business in the Nursery and Seed Trade.—Apply early to JAMES MCKIE, Writer, in Dumfries.

PASCAL'S PATENT FUMIVORE AND SELF-ACTING VENTILATOR.—The attention of the public is respectfully directed to this truly valuable invention. The scientific arrangement of this apparatus entirely obviates the inconvenience and annoyance of Smoky Chimneys, arising from any cause whatever. It is also adapted to all purposes of sanitory ventilation, particularly in places of public resort. Schools, Chapels, Barracks, Banks, large retail Shops, Hospitals, Taverns, and Ships' cabins, and such other places where gas is consumed or close stoves are in use. The three vanes or fans, as shown in the section, are set in rapid motion by the ascensive force of the heated air or smoke, causing a powerful exhaustion or withdrawal of the smoke from the chimney or vitiated air generated in close rooms. It obviates the necessity of all chimney stacks or high tubes.

For particulars apply to Mr. SEPTIMUS BRAITHWAITE, 108, Great Russell-street, Bloomsbury, where contracts may be entered into for the warming by improved methods, and ventilating of any building.

SEASONING OF WOOD, &c.—The Patent Desiccating Company's drying process has been most successfully applied to the seasoning of wood as the only sure method of preventing subsequent shrinkage, and increasing its strength; it also improves the colour, and is rendered in a few days perfectly fit for use. Full particulars of the efficiency and economy of the process, with certificates from Builders, Ship-builders, Carriage-builders, Cabinet-makers, Millwrights, Pianoforte-makers, and others, of the proved advantages, forwarded on application to the Secretary, 41, Gracechurch-street, London. This plan has been also adapted to general drying, for agricultural purposes, where clean, uniform, and expeditious drying is required.

HOSE FOR LIQUID MANURE, Fire-engine, and agricultural purposes, made of canvass, lined and coated with gutta purcha; it is about one-third the price of leather or india-rubber, it will convey liquids of all kinds under a heavy pressure, it is extensively used at the Government public works by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

METCALFE AND Co's NEW PATENT TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1s. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co's, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2s. per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

ROYAL POLYTECHNIC INSTITUTION.—In addition to the usual programme, a Lecture on the CULTURE and APPLIANCES of FLAX, by THOMAS BEALE BROWN, Esq., on Wednesday and Saturday, at 2 o'clock; and a Lecture on the PREPARATION and BLEACHING of FLAX, by J. H. PEPPER, Esq., at a Quarter past 3 o'clock, commencing on Wednesday next, especially for Agriculturists.

APPETITE AND DIGESTION IMPROVED.

LEA AND PERRINS' WORCESTERSHIRE SAUCE imparts the most exquisite relish to Steaks, Chops, and all Roast Meat Gravies, Fish, Game, Soup, Curries, and Salad, and by its tonic and invigorating properties, enables the stomach to perfectly digest the food.

The daily use of this aromatic and delicious Sauce is the best safeguard to health.

Sold by the Proprietors, LEA and PERRINS, 6, Vere-street, Oxford-street, London, and 68, Broad-street, Worcester; also by Messrs. Barclay and Sons, Messrs. Crosse and Blackwell, and other Oilmen and Merchants, London; and generally by the principal dealers in sauce.

N.B.—To guard against imitations, see that the names of "LEA and PERRINS" are upon the label and patent cap of the bottle.

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—In consequence of a very inferior article being now too frequently sold under the name of these favourite Ales, the public are respectfully requested to apply at the respective stores, where a list of bottlers will be furnished, from whom these ales may be obtained genuine, and where also they may be had in casks of 18 gallons and upwards, either singly or in any quantity. Apply to Messrs. SAMUEL ALLSOPP and SONS, The Brewery, Burton-on-Trent, or their Stores, at 61, King-William-street, City; Cock-street, Liverpool; High-street, Birmingham; the Exchange, Manchester; and 33, Virginia-street, Glasgow.

TOOTHACHE PREVENTED by using BRANDE'S ENAMEL for filling decaying Teeth, and rendering them sound and painless. Price 1s. Enough for several Teeth. The only substance approved by the medical faculty, as being unattended with pain or danger, and the good effects of which are permanent.

Sold by all Chemists in the United Kingdom. Twenty really authorised Testimonials accompany each box, with full directions for use. Sent free by return of post by J. WILLIS, 59, Fleet-street, London, in return for thirteen penny stamps.

CAUTION.—The great success of this preparation has induced numerous unskilful persons to produce spurious imitations, and to copy BRANDE'S ENAMEL advertisements. It is needful, therefore, to guard against such impositions, by seeing that the name of JOHN WILLIS accompanies each packet.

THE HIPPOPOTAMUS, presented to the ZOOLOGICAL SOCIETY by H.H. the Viceroy of Egypt, is Exhibited daily at their Gardens, in the Regent's Park, from 11 to 4 o'clock. Visitors desirous of seeing the Animal in the water are recommended to go early.

Admission, One Shilling; on Mondays, Sixpence.

INTERESTING FACT.—"The following singular and authentic case of restoration of the human hair is worthy of observation, more particularly as it relates to an article of high and universal repute during the last half century. Mr. A. Herrmann, of Queen-street, Soho, had been quite bald for some time past, and had tried various preparations for the recovery of his hair, but without any beneficial result. He was then induced to try the effects of 'ROWLANDS' MACASSAR OIL,' and after daily applying it for about two months, he, much to his gratification, had his hair quite restored, and now possesses a beautiful head of hair. This fact speaks too strongly for itself to require comment."—*Bell's Weekly Messenger.*

ROWLAND'S MACASSAR OIL.

The unprecedented success of this discovery in restoring, preserving, and beautifying the Human Hair, is too well known and appreciated to need comment. For Children it is especially recommended as forming the basis of a Beautiful Head of Hair, and rendering the use of the fine comb unnecessary.

Price 3s. 6d.—7s.—Family Bottles (equal to 4 small), 10s. 6d., and double that size, 21s. per bottle. N.B. Each bottle of the genuine article has the words ROWLANDS' MACASSAR OIL engraved in two lines on the Wrapper; and on the back of the Wrapper nearly 1500 times, containing 29,028 letters.

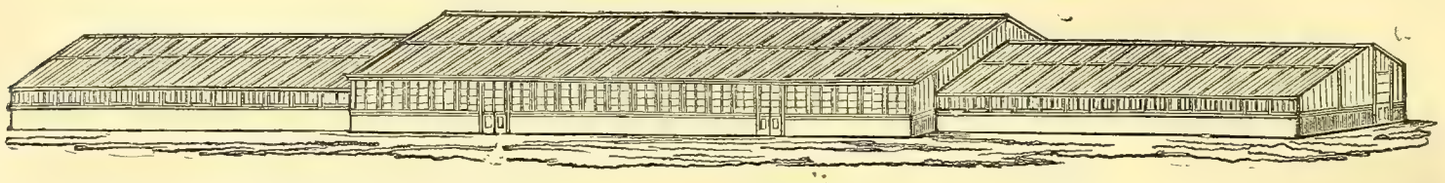
Sold by A. ROWLAND and SONS, 20, Hatton-garden, London; and by Chemists and Perfumers.

A PERFECT SUBSTITUTE FOR SILVER.—The most effective imitation is in the Spoons and Forks, that have a body of real silver plated over the British plate. So accurate and durable are these, that twenty years' wear would not show that they were not real silver, and they do not cost one quarter the price. The fact is, the interest of the money that would be paid for real silver will buy these things oftener than they are wanted. Prices of British Plate covered with real Silver:—Table Spoons per dozen, 44s.: Dessert Spoons, ditto, 34s; Tea Spoons, ditto, 16s.; Table Forks, ditto, 40s.; Dessert Forks, ditto, 30s; Sugar Tongs, per pair, 4s. 6d.; Sauce Ladles, each, 4s. 6d.; Gravy Spoons, each, 8s. 6d.; Soup Ladles, each, 16s. 6d. They are manufactured exclusively for MECHI, 4, LEADENHALL-STREET, near the India House. The money will be returned to any purchaser who disapproves them. A very large assortment of Plated Fruit and Dessert Knives, real Sheffield Plated Goods, Table Cutlery, Small Cutlery, and other matters connected with housekeeping, of which Catalogues may be had gratis.

COMFORT FOR TENDER FEET, AND A CERTAIN CURE FOR CORNS AND BUNIONS.

PAUL'S EVERY MAN'S FRIEND,
Patronised by the Royal Family, Nobility, &c.

PAUL'S EVERY MAN'S FRIEND, which gives relief on the first application. Paul's Every Man's Friend (Corn Plaister) is generally admitted to be the best emollient application for Corns and Bunions, and is worthy of a trial on the part of those who are afflicted with such unpleasant companions. Testimonials have been received from upwards of 100 Physicians and Surgeons of the greatest eminence, as well as from many officers of both Army and Navy, and nearly 1000 private letters from the gentry in town and country, speaking in high terms of this valuable remedy.



Prepared by John Fox, in boxes, at 1s. 1½d., or three small boxes in one for 2s. 9d.; and to be had, with full directions for use, of all wholesale and retail Medicine Vendors in Town and Country. The genuine has the name of "JOHN FOX" on the Government Stamp. A 2s. 9d. box cures the most obdurate corns. Ask for "Paul's Every Man's Friend."

Sold by Barclay and Sons, Farringdon-street; Edwards, 67, St. Paul's Churchyard; Butler and Harding, 4, Cheapside; Newbery, St. Paul's; Sutton, Bow Churchyard; Johnston, 68, Cornhill; Sanger, 150, Oxford-street; Willoughby and Co., 61, Bishopsgate-street Without; Eade, 39, Goswell-street; Prout, 229, Strand; Hannay and Co., 63, Oxford-street; Watts, 106, Edgware-road; and retail by all respectable Chemists and Medicine Vendors in every town in England. Wholesale Agents for Ireland and Scotland, Messrs. J. and R. RAIMES and Co., Druggists, Edinburgh.

# GRAY AND ORMSON,

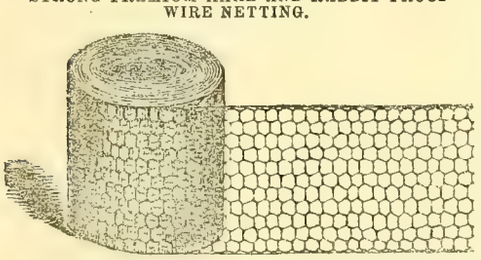
## DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[ERECTED FOR JOHN SHAW LEIGH, ESQ., LUTON HOO.]

Extract of a Letter from Mr. FRASER.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, JOHN SHAW LEIGH, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.



(Signed.) "JAMES FRASER, Gardener, Luton Hoo Park."

---

GARDENERS' CHRONICLE.—To be Sold, a Set, from the commencement of 1841 to the end of 1850 (10 Volumes in all). All well bound, in green cloth, and in perfect and clean condition. Lowest price, 8*l.* 8*s.*—Address, J. L., Office of this Paper.

---

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

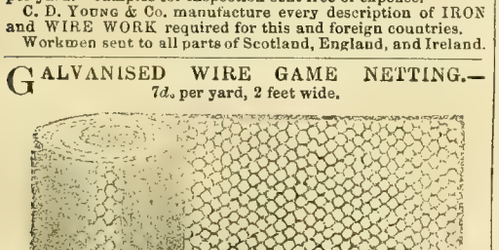
The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

| | | | |
|---|---|---|---|
| Or a web of 100 yards, 18 ins. wide, will cost | .. | £3 | 15 0 |
| Do. of 100 yards, 24 ins. wide | .. .. | 5 | 0 0 |
| Do. of 100 yards, 30 ins. wide | .. .. | 6 | 5 0 |
| Do. of 100 yards, 36 ins. wide | .. .. | 7 | 10 0 |

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.



C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

---

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24-inch wide | ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, strong ,, | ... | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, | ... | 12 ,, | 9 ,, |
| ¾-inch ,, light ,, | ... | 8 ,, | 6 ,, |
| 1¼-inch ,, strong ,, | ... | 10 ,, | 8 ,, |
| 1¼-inch ,, extra strong ,, | ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

---

PRIZE ESSAYS.—A PRIZE OF FIVE GUINEAS will be given by Mr. WILLIAM E. RENDLE, Plymouth, through the South Devon Botanical and Horticultural Society, for the best ESSAY—

"*On the Cultivation and General Management of a Kitchen Garden; including the Rotation of Cropping, and Description of the best Vegetables.*"

A PRIZE OF FIVE GUINEAS will also be given by Mr. WILLIAM E. RENDLE, through the same Society, for the best ESSAY—

"*On Heating Horticultural Structures, including the best mode of applying Bottom Heat.*"

The above to be competed for by Gentlemen's Gardeners only, and to be sent in to the Secretary not later than the 1st of September next.

Persons wishing to contribute are desired to communicate with the Secretary, JOHN C. HANCOCK, Esq., Stonehouse, Devon, as early as possible, from whom all other particulars can be obtained.

Mr. RENDLE has received a communication from a correspondent signed "Hope," without an address. He is requested to communicate with the Secretary.

---

SMART'S UNRIVALLED, DOUBLE, CRIMSON BRANCHING STOCK.

JAMES SMART, SEEDSMAN, 56, Queen-street, Glasgow, can confidently recommend the above, as the best ever offered to the public for richness of colour and fragrant odour, combined with its graceful habit of growth.—Sold in Packets, at 5*s.* and 2*s.* 6*d.* each.

---

JAMES DICKSON AND SONS, NURSERY and SEEDSMEN, Hanover-street, Edinburgh, beg to inform their numerous customers and the Public that the HYACINTH BLOOMS, which took the First Prize this day at the Royal Caledonian Horticultural Society, are now ON VIEW at their Nurseries in Inverleith-row.—March 8.

---

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, March 8.

---

NEW, TRUE, AND GENUINE GARDEN SEEDS.

CLARKE AND CO., SEEDSMEN and FLORISTS, 86, High-street, Borough, London, about 30 doors from the London-bridge Railway, beg respectfully to inform the public generally they have a choice and well selected stock of GENUINE KITCHEN GARDEN SEEDS of the growth of 1850, and beg to direct especial attention to the following collection, having supplied the same sorts and varieties for some years past, which have always given great satisfaction to all purchasers who have patronised us. The collection as follows, price 10*s*, sent to any Booking-office, Wharf, or Railway in London, free:—2 qts. Early and Marrow Peas, four best sorts; 2 qts. Early and Late Beans, four best sorts; 2 oz. Onion, four early and keeping sorts; 1 pt. Radish, three sorts of the Long and Turnip; 1 pt. Summer Spinach; 1 oz. Celery, two best Red and White sorts; 2 oz. Carrot, two best sorts; 2 oz. Turnip, two best sorts; 2 oz. Cabbage, four early and late sorts; ½ oz. true Cauliflower; 1 pt. Mustard and Cress; 2 oz. Broccoli, four best early and late sorts; ½ oz. Brussels Sprouts (imported); ½ oz. Crimson Beet; ½ oz. Scotch Curled Kale; ¼ oz Long Prickly Cucumber; 1 packet Windsor Prize Frame Cucumber; ¼ oz. Endive; ½ oz. Flag Leek; 1 oz. Lettuce, four Cos and Cabbage sorts; 1 oz. Myatt's Garnishing Parsley; 1 oz. Jersey Parsnip; 1 packet Tomato; 1 packet choice Melon; 6 packets useful Herbs.

C. and Co. will be happy to forward their New Catalogue of of Seeds anywhere upon application.

---

ALEX. ROBERTSON, of Box-hill Nursery, Dorking, (adjoining the Box-hill Station, South-Eastern Railway,) having a Surplus Stock of the under-named articles, will supply them at very moderate prices:—Common Laurels, 2, 3, 4, 5 and 6 feet; Strong Mahonia Aquifolium; Spruce Firs, 2 to 3 feet; Beech, 4 to 6 feet; Ash, 4 feet; Walnuts, 7 to 9 feet; English and Turkey Oaks, Sycamore, Birch, 8, 9, 10, 11 and 12 feet. The whole of the above are unexceptionable, both as regards root and top. All inquiries promptly attended to.

NATIONAL FLORICULTURAL SOCIETY.—OFFICES, 21, REGENT-STREET, LONDON.

The Printed Rules, &c., of the NATIONAL FLORICULTURAL SOCIETY will be forwarded to all *post-paid* applications.

JOHN EDWARDS, Hon. Sec.

THE LONDON FLORICULTURAL SOCIETY.—The Subscribers and Friends of this Society are respectfully informed, that the Days and Place of Meeting for the current year, for the Exhibition of Flowers, will be fixed in the course of the ensuing week, and will be advertised in next Saturday's *Chronicle*.

J. W. JEWITT, Hon. Sec., 45, Lime-street, London, March 15.

TO FLORISTS, NURSERYMEN, AND GENTLEMEN'S GARDENERS.

A BAZAAR, FLOWER SHOW, AND HORTICULTURAL FETE, on an extensive scale, will be held in the Grounds and Premises of Tarvin Hall, near Chester, the last week in August next. Flowers, Fruits, and Garden Vegetables of every description, then in season, may be shown, and prizes competed for. To give practical usefulness to this Exhibition, it is required that every specimen shall be labelled by the contributor with his own name and address, the name and address of the original grower, the present price of the seed or plant, and the time of planting. By this means the relative merits of the different varieties may be fairly tested, and the visitors will be thereby directed where to apply for the best descriptions. All particulars may be known on application to Dr. Brindley, or to the Gardener, Mr. Vair, Tarvin Hall, Chester. A complete Catalogue of every specimen, with full particulars as above, will be printed at Dr. Brindley's expense, for circulation.—Tarvin Hall, Chester, March 15.

VERY FINE TWICE TRANSPLANTED SPRUCE FIRS AND BRITISH OAKS.

MESSRS. WOOD AND INGRAM beg to offer SPRUCE FIRS as above, 2 to 3 feet, 30*s.*, and 3 to 4 feet, 35*s.* per 1000. These are very fine stuff, well feathered to the ground. British Oaks, 6 to 8 feet high (raised from very fine trees in Brampston Park, the seat of Lady O. B. Sparrow), at 60*s.* per 1000. These are admirably adapted for filling up old plantations, being stout in proportion to the height. If 10,000 are taken a reduction will be made.

Huntingdon Nurseries, March 15.

HOLLYHOCK SEED.

EDWARD TILEY begs to inform the lovers of that beautiful flower that he has been successful in procuring a quantity of good sound SEED of the above from an Amateur Gentleman who has one of the most superb and choice collections in cultivation; the seed having been selected with every care and attention, he can confidently recommend it. Sold at 2*s.* 6*d.* per packet, containing 150 seeds, or 5*s.* for a packet of 400 seeds.

GERMAN ASTER SEED.

Unequalled for the superiority of flower, the shape of which forms that of half a globe, and has been admired by thousands of spectators at numberless exhibitions. There are from 20 to 30 varieties, 1*s.* per packet.

SWEET-WILLIAM SEED.

Saved from 24 superb varieties. The flowers are very large, and of dwarf habit. They were much admired when in bloom, by countless spectators, and the Seed numerously ordered by them; 1*s.* per packet.

ANTIRRHINUM SEED.

E. T. being a most extensive grower of all the choicest sorts known in cultivation, has selected the Seed with great care from the finest varieties, as to colour, shape and habit of plant. There are more than 50 distinct varieties; 1*s* per packet.

DWARF ORANGE AFRICAN MARIGOLD SEED.

Unrivalled for its superior size and darkness of colour, many of the flowers last season measuring 5 inches over, and not more than 1 foot high; 6*d* per packet.

Or, if preferred, a 5*s.* packet of Hollyhock and a packet of each of the above varieties for 7*s.*

Walcheren Cauliflower Broccoli (as imported) 1*s.* 0*d.* p. packet.
Tamworth Broccoli ... ... ... ... 1 0 ,,
Wilcove Broccoli ... ... ... ... 1 0 ,,
Cole's Superb Solid Celery ... ... ... 0 6 ,,
Bath Cos Lettuce, seed true, the best and purest flavoured in cultivation ... ... ... 1 0 ,,

A remittance must accompany the order, either in cash or penny postage stamps for the amount.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath.

HUGH LOW AND CO. have to offer fine large Tubers of the under-named Tropæolums:—

Azureum ... ... 5*s.* 0*d.* | Edule ... ... 7*s.* 6*d.*
Brachyseras ... 1 6 | Tricolorum ... 1 6

Prices to the Trade on application.—Clapton Nursery, London.

CAMELLIA STOCKS FIT FOR IMMEDIATE WORK.

RENE LANGELIER, Clarendon Nursery, St. Helier, Jersey, begs to inform the Public that he has a very extensive stock of the above, fit for immediate grafting, very clean and healthy, well rooted, so as to leave without the po', consequently much less expense in conveying to any distant place. Price 36*s.*, 40*s.*, and 50*s.* per 100.

The Stock is such as has never before been offered to the Public by any grower.

R. L. has a most extensive collection of Double Camellias at a very moderate rate and reduced price, as will be seen by a Catalogue recently published, in which it is proved that they can stand the climate out-of-doors without protection. The Catalogue can be had of R. L. by inclosing four penny stamps. Remittance or reference from unknown correspondents.

ORNAMENTAL PLANTING.

C. LODDIGES AND SONS are still supplying collections of ORNAMENTAL TREES at the same extraordinary low prices for cash in consequence of their Arboretum (the largest in Europe) being broken up.

Fine specimens, 5 to 10 feet, correctly named, of the following genera: Acer, Æsculus, Alnus, Betula, Cornus, Corylus, Cotoneaster, Crataegus, Cytisus, Fraxinus, Populus, Prunus, Pyrus, Ribes, Robinia, Salix Sorbus, Spiræa, Tilia, Ulmus, &c., at 4*s.* per dozen. A selection from the above, unnamed, well adapted for Park planting, 25*s.* per 100, or 10*l.* per 1000.

A COMPLETE ARBORETUM, containing upwards of 1200 distinct species, correctly named, can be supplied for 50*l.*

Post-office orders on Hackney.

MITCHELL'S ROYAL ALBERT RHUBARB has proved itself to be the earliest, finest flavoured, and most productive kind, as well as the best for early forcing, ever yet grown. Strong roots, 12*s.* per dozen. Also Myatt's Linnæus, 12*s.* per dozen; and Victoria, 9*s.* per dozen; with usual allowance to the trade Post-office orders are requested to be made payable to WILLIAM MITCHELL, Enfield Highway, Post-office, Enfield, Middlesex.

SEED AND HORTICULTURAL ESTABLISHMENT, SUDBURY SUFFOLK.

BASS AND BROWN'S SEED AND PLANT LIST FOR 1851 *is stamped as a Newspaper, to go free by post, and may be had on application. It will be found to contain the newest and best articles which can be procured, with full description and other useful information.*

SELECT AND CHOICE FLOWER SEEDS.

Remittances with orders are requested from unknown correspondents. Goods Carriage Free to London, and with all orders of 2*l.* and upwards, articles presented extra. Post-office orders payable to BASS and BROWN, or to STEPHEN BROWN.

BEAUTIFUL HARDY CYPRESS, CUPRESSUS GOVENIANA.

ADAM PAUL AND SON beg to offer handsome Seedling Plants of the above new CALIFORNIAN CYPRESS. Well feathered to the base, 1 to 2 feet, 10*s.* 6*d.* each; 2 to 3 feet, 15*s.* each. Package 1*s.* extra, carriage free to London.

N B. A large stock of Cedar of Lebanon, Cedrus Deodara, Abies morinda, and Pinus excelsa, handsome seedling Plants 1, 2, 3, 4 and 5 feet high, prices moderate, and furnished on application.—Nurseries, Cheshunt, Herts, March 15.

TO POTATO AND CUCUMBER GROWERS.

JAMES LAKE, NURSERYMAN, &c., Bridgewater, Somerset, begs to inform the Public that he is now ready to send out his Seedling FIFTY-FOLD KIDNEY POTATO, which has been proved and highly recommended by Dr. Lindley, Messrs. Beck and Henderson, Hurst and M'Mullen, and many others. Price 4*s.* per peck.

London Agent: Hurst and M'Mullen, 6, Leadenhall-street.

J. L. having grown from 15 to 20 lights of Aban's Conqueror of the West CUCUMBER successfully for three years, can with confidence recommend it to the Public as being one of the best kinds in cultivation. Packets containing 12 seeds, 1*s.* each.

WANTED, a Contract for LAYING OUT 15 front and back GARDENS.—Apply to Mr. J. HENDREY, Architect, 4, Pancras-lane, Cheapside, London.

MORGAN'S KING OF THE DAHLIAS.—Owing to the demand for ground roots, the stock will be disposed of as follows:—Ground roots, 5 guineas each; or pot roots, 2 guineas each; Plants first week in May, 10*s.* 6*d.* each. The usual allowance to be made to the trade where a dozen are ordered. The roots are now beautifully broke. This Dahlia was named by Mr. Glenny; and for further particulars see "Glenny's Garden Almanac," page 94; and also "Glenny's Journal," Dec. 14th, 1850. In his answers to Correspondents he says, "We will never give another opinion of a Dahlia publicly, if 'The King of the Dahlias' does not prove the best of all the Crimsons; and we shall be dreadfully disappointed if it be not the best of all the Dahlias, not barring colour. We may be wrong, but if so we will never be wrong any more; and we are quite sure of its being the most extensively grown of any." A remittance will be required from unknown correspondents.

A. MORGAN, Cross-street, Oswestry, Shropshire.

JOHN WILMOT (late WILMOT and SON), begs to inform the Nobility, Gentry, and the Trade, that any orders they may honour him with will be attended to with the same punctuality as during his father's life-time.

Isleworth, March 15.

WARRANTED UNEQUALLED.

ROBERT WHIBLEY is now supplying Selections in Pots, and by Post, from his select Collection of FUCHSIAS. Twelve Varieties, new and distinct, of last year, 10*s* 6*d.* cash. See List containing a great variety of choice new Plants for one stamp.—Nursery, Kennington, London.

VALUABLE VEGETABLES.—CAULIFLOWERS.—Myatt's improved early, much earlier than the old varieties, more compact and heavier, considered by the raiser as most desirable, quantity very limited, 1*s.* packets.

BRUSSELS SPROUTS, improved variety, direct from Brussels; 1*s.* per oz. 6*d.* per packet.

CABBAGE, MITCHELL'S ENFIELD.—This has been tried at the Horticultural Society's Garden, and pronounced one of the best; 1*s.* per oz., 6*d.* per packet.

CABBAGE, CHAPPEL'S COLEWORT, excellent for Winter Greens; 6*d.* per oz.

CARROT, ST. JAMES', one of the best for small gardens, and shallow or heavy soils; 3*d.* per oz.

CELERY, COLES' SUPERB RED, very extensively grown last season, and pronounced first-rate; 1*s.* per oz., 6*d.* per packet.

LETTUCE, VICTORIA CABBAGE, but little known, but one of the handsomest grown, and which no gentleman's garden should be without.

DUNCAN HAIRS, in offering the above selection from his general List, begs to inform his friends that he warrants them to be as described.

109, St. Martin's-lane, Charing-cross, London.

GEORGE MILLS, 15 years Steward and Gardener to the late Baroness de Rothschild, at Gunnersbury-park, Ealing, Middlesex; 32 years F.H.S. of London; author of a Treatise on the Culture of the Cucumber, Melon, Seakale, and Asparagus; as also of a Treatise on the Culture of the Pine-apple; who has practised Horticulture, Agriculture, and Arboriculture 50 years, on the cold clay soils of Hants and Essex, as also on the light and warm soils of Bucks, Surrey, and Middlesex, begs most respectfully to offer his opinion on all subjects relating thereto, excepting Botany and Chemistry.

G. M. is induced to make the above offer from the advantage he derived in early life from the advice of a friend, his senior in practice. He has long been quite satisfied that the land under cultivation in this country, although great improvements have been made within the last 20 years by drainage, &c. &c., is still capable of greater improvement, and the hope of seeing those improvements carried out, induces him to offer his opinion thereon.

G. M. will give his opinion only where his experience will enable him to give it confidently.

Terms, 2*l.* per day, exclusive of travelling expenses; for less than a day, 1*l.*

GEORGE MILLS, Loraine Cottage, Hammersmith, Middlesex.

NEW DWARF DAHLIAS.—GAINES'S PRINCE ARTHUR; beautiful carmine, very large; 1½ ft.; 10*s.* 6*d.*

Opinion of the Gardeners' and Farmers' Journal: "*N. G., Battersea.* We received your blooms in capital condition. We congratulate you on your success. PRINCE ARTHUR: Outline good, centre fair, shape and substance of florets desirable; depth of do. amply sufficient; colour splendid carmine; size large. Prince Arthur's dwarf habit will prove a great recommendation; its greatest height 1½ ft."

GAINES'S RACHEL; crimson purple, tipped with white, large size; 3 ft.; 10*s* 6*d.*

Opinion of the Gardeners' and Farmers' Journal: "RACHEL: Very attractive outline excellent centre, good shape, substance of florets most desirable, depth amply sufficient; colour, brilliant crimson purple, showing to the greatest advantage the clear wax-like tip of French white; size truly noble."

N. GAINES begs to say he will be able to send out, the 24th March, KINGHORN'S new CALCEOLARIAS, also those raised by himself and others, which obtained Certificates of Merit.

Catalogues of Geraniums, Dahlias, Calceolarias, and other plants, may be obtained by applying to the Nursery, Surrey-lane, Battersea, near London.

N.B. A quantity of large Laurestinus and Box Trees for sale.

DILLISTONES AND CO., of the Nurseries, Sturmer, near Haverhill, Suffolk, have to offer a few hundreds of Polyanthuses, saved from named flowers, 20*s.* per 100, 3*s.* per dozen; double major white Rocket, 20*s.* per 100, 3*s.* per dozen; finest climbing Roses, 6*s* and 9*s.* per dozen; fine hardy Climbing Plants, including some beautiful new Honeysuckles, &c., 9*s.* per dozen; Herbaceous Plants, in fine collections, 30*s.* per 100; Hollyhocks, saved from fine named flowers, 15*s.* per 100, 2*s.* 6*d.* per dozen.

JOHN SCHOFIELD AND SON, KNOSTHORPE, near LEEDS, beg to offer the following NEW CARNATION:—

KNOSTHORPE PET (SCHOFIELD'S), S.B. For description, see *Florist* for September, and *Midland Florist* for October, 1850. Strong plants, per pair, 10*s.* 6*d.*

NEW PICOTEE, LADY HARWOOD (SCHOFIELD'S), purple, of medium width, and white very pure. For description, see *Florist* for September, and *Midland Florist* for October, 1850. Strong plants, per pair, 10*s.* 6*d.*

NEW PANSY, NONPAREIL (SCHOFIELD'S), golden yellow, with broad margin of rich bronze purple, warranted a fine and bold show-flower, 5*s* each.

KNOSTHORPE PET and LADY HARWOOD having been submitted to the Metropolitan judges and pronounced first class, J. S. and SON have much confidence in recommending the same to the notice of their Friends and the general Trade. The Stock is in the highest state of health, as also are the following, which they offer at a low rate: viz., 24 extra fine Show Pansies, 20*s.*; 12 pairs extra fine Show Carnations or Picotees, 12*s.*; 12 pairs extra fine Show Pinks, 10*s.*; a fine collection of Dahlias, Fuchsias, Calceolarias, Verbenas, &c., &c. A full Descriptive Catalogue of the above is now ready, and may be had free. Very select Pansy Seed, 2*s.* 6*d.* per packet.

RIVERS'S STUBBLE SWEDE TURNIP SEED.

J. RIVERS solicits the attention of Agriculturists to his quick-growing SWEDE TURNIP. The variety owes its origin to a cross between a large variety of the Early Stone, in 1842, and the old Green Top Swede. It has become a distinct variety, by carefully selecting, for seven years, those most like the Swede in habit, so that now it is a true Swede, with the earliness of the White Stone; it is green-topped, with a short neck, with the solid yellow flesh of the common Swede; for sowing in May, for early feed, or for late sowing upon heavy land and sheep-fed leys, it will be found a valuable Turnip for hardiness and keeping qualities; also for sowing near large towns, to draw off early. It grew 11 tons per acre after Tares, mowed, without manure, on the 6th of August, 1849. Specimens of the roots were exhibited at the Baker street Cattle Show; also Specimen Roots of different times of sowing, from May till August, were exhibited. Orders for any quantity above 10 lbs. will promptly be attended to, if addressed to JOHN RIVERS, Seedsman, Sawbridgeworth, Herts, at 2s. per lb., carriage paid to London. It will be sold in sealed bags, of 2½ lbs., price 5s., and 5 lbs., 10s., by the following agents for England:—Chilwell, near Nottingham, Mr. J. Pearson, Seedsman; Cirencester, Mr. R. F. Darby; Malton, York, N.R., Mr. J. Slater; Reading, Berkshire, Messrs Sutton; Sudbury, Suffolk, Messrs. Bass and Brown; Plymouth, Mr. Pontey; Sheffield, Messrs. Fisher and Holmes; Hull, Messrs. Dickson. For Scotland:—Aberdeen, Mr. J. Roy; Edinburgh, Waterloo-place, Messrs. Dicks n; Glasgow, Messrs. Austin and Aslan. For Ireland:—Clonmel, Mr. Higgins.

THE BLACK AUSTRIAN PINE.—"PINUS AUSTRIACA."

LUCOMBE, PINCE, AND Co. have a large and healthy stock of this most desirable Pine, exceeding 300,000, from 9 inches to 3 feet high, which having been frequently transplanted, are well rooted and safe to remove; they can offer them, varying according to age and quality, from 20s., 40s., to 60s per 1000. This Pine has been proved to thrive in bleak and exposed places, and in the poorest soils; growing rapidly and producing dense shelter in places where other trees will not grow; it also thrives well close to the sea, resisting the spray and roughest winds.

Exeter Nursery, March 15.

THE PLANTING SEASON.—WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WM. WOOD AND SON having still on hand a very extensive and superior stock of ROSES, will be happy to supply collections as under (the selection of sorts being left to themselves). The plants are remarkably strong and healthy, and none but first-rate kinds will be sent.

| ROSES. | Per dozen. |
|---|---|
| Extra tall Standards, budded with from 3 to 6 best varieties on a stem ... ... ... ... | 42s. to 60s. |
| Extra superior selected Standards ... ... ... | 18s. to 24s. |
| Fine Dwarfs and Dwarf Standards ... ... ... | 10s. to 16s. |
| Superb do. do. (for exhibition) ... | 18s. |
| Fine Dwarfs, on own roots, in 50 varieties, per 100 ... | 50s.. |
| Good do. do. without names, per 100 | 30s. |

N.B. A liberal quantity of plants will be given over with each order. Catalogues free on application.

Rose Nippers, of various sizes, for pruning, 2s. 6d. to 4s each. The Nippers are of an improved shape, being made so as to remove a shoot without bruising the part left; they are highly recommended as a useful addition to the implements of amateurs. Metallic Labels for pot Roses. 2s. per 100.

UNRIVALLED PRIZE ASTER, 24 Varieties mixed.—The superiority of this Aster over the imported Seed is already well known by the numerous Prizes awarded it in England and Wales, viz, 22 first Prizes; and last season has proved it is also adapted to the northern countries, having been grown in the flower-garden of Miss Hamilton, of Bothwell Park, N.B, where it was much admired as a bed among Miss Hamilton's choice collection of Plants, and gained for her gardener, Mr. Greenlees, several Prizes. To prevent disappointment, early orders are solicited, as the stock is small. By inclosing 13 postage stamps to JOHN REID, Nurseryman, &c., Weston-Super-Mare, a packet will be sent free to any part.

HUGH LOW AND CO. beg to offer established Plants of the undernamed:

| | |
|---|---|
| PHLOX, 24 superior sorts, each ... ... ... | 1s. 0d. |
| ,, 24 newer varieties, each ... ... ... | 1 6 |
| ,, 12 best Belgian varieties of last year, each | 2 6 |
| CHRYSANTHEMUMS, in great variety, per doz.... | 9 0 |

LILIPUTIAN CHRYSANTHEMUMS. — These miniature varieties have, during the past season, established themselves as great favourites, on account of their dwarf habit and profuse blooming.

12 varieties of 1849, 1s. each, or 9s. per dozen.
18 ,, of 1850, 2s. each, or 18s. per dozen.

GLOXINIAS, 6 fine Continental hybrids, 2s. 6d. each.

BLUE MIMULUS (Mimulus ringens), a fine hardy herbaceous plant, 2s. 6d. each.

A few fine round-headed SWEET ORANGE TREES, 2 feet stems, full of fruit, 15s. each.

Post-office orders payable at Hackney.

Clapton Nursery, London.

MESSRS. HAY, SANGSTER, AND CO. will be ready to supply their prepared POTATO CUTTINGS about the middle of April next, the produce of which proved so highly satisfactory last, as well as the experimental trials of the three former years, as to QUALITY, QUANTITY, and SIZE, being more than double the crop this year of those planted in the usual way, and containing a much larger quantity of starch, which is so essentially necessary to the preservation of that valuable root. A report of the analysis will be found below. Our own experiments give about one-third more saccharine matter than the best we could procure grown under the old system. All orders must be to hand on or before the end of the second week in April, as H. S. and Co. are preparing to plant a large breadth, and will only provide for what may be ordered up to that time. Post-office orders to be made payable to JOHN SANGSTER, at the Borough Post-office, Southwark. Printed instructions for planting and management will be sent with the plants ordered.

TO THEIR WAREHOUSE, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

PERMANENT PASTURE.

HENRY ROGER SMITHE, of Eastling, Faversham, Kent, informs the Public that his mixtures of the Natural Grasses and small Clovers—excluding no sort which is proper to form a PERMANENT PASTURE, as the soil &c. may direct—are now ready; delivered on the railway free of charge, at 1l. per acre, allowing 3 bushels as seed for an acre; also Lawn Mixtures, and the sorts separate. They are gathered under his immediate superintendence, and are quite new; this unprecedented low price last year, and the prospects of agriculture, having created an unlooked-for demand.

Also NATURAL GRASSES and CLOVER for permanent Pasture, mixed expressly to suit the soil, 28s. per acre.

*Goods delivered free of carriage, as see* Messrs. Sutton's *Advertisement in the last page of the* Gardeners' Chronicle *on March* 1.

ESTABLISHED 1786.

WILLIAM E. RENDLE and CO., Seed Merchants by special appointment to the South Devon Agricultural Association, and several influential Members of the Royal Agricultural Society, Union Road, Plymouth.

We have this season a choice and well assorted Stock of all the best FARM SEEDS. They have been grown and selected with the greatest care, and can be highly recommended as being of the most genuine quality. Our sale of Turnip Seeds alone last season exceeded *one thousand bushels*; our extensive dealings therefore enable us to sell at the lowest remunerating prices, and at the same time is the strongest evidence we can offer of the large and increasing patronage bestowed upon us, for which we have to return our most grateful acknowledgments.

OUR DESCRIPTIVE CATALOGUE OF FARM SEEDS *is just published, and can be had in exchange for One Penny Stamp. It contains a description of all the best varieties of Turnips, Carrots, and Mangold Wurzel, with prices affixed to every article. The list of Grasses is peculiarly comprehensive, and contains short descriptions of all the leading kinds. There is also some useful advice relative to the sowing of Grass Seeds for permanent pasture, concerning which* Mr. Kemp, *of Birkenhead Park, in a letter to us says:—"I am glad that you repudiate the practice of sowing Corn with Grass Seeds, a custom I have often had to combat."*

All Orders above 2*l.* Carriage Free. (See Catalogue.)

Apply to William E. Rendle and Co., Seed Merchants, Plymouth.

WM. HAMILTON, Seedsman and Florist, 156, Cheapside, London, advertises the following for the benefit of those who may not be in possession of his Catalogue. They are really fine, and have for successive years given the highest satisfaction, being superior to the general run of German Seeds.

N.B. Agent for the registered Rose Girdle Label.

NEW AND CHOICE FLOWER SEEDS, GERMAN STOCKS, GERMAN ASTERS, &c.

J. C. WHEELER and SON, Nurserymen and Seedsmen, by Official Appointment, to the Gloucestershire Agricultural Association, 99, Northgate-street, Gloucester, have selected, out of a large collection of Flower Seeds, 20 of the most beautiful and showy varieties, each sort distinct in colour, and calculated to produce a fine effect when planted out in beds or groups in the flower border. Each variety is distinctly marked with its Botanical and English name, height, time of flowering, colour of the flower, manner of growing, whether erect or trailing, &c., &c., the time it should be sown, and other valuable hints as to its cultivation. In selecting these 20 varieties, care has been taken to exclude all which are shy-bloomers, or have an insignificant appearance; so that the collection will comprise only those which are really showy and handsome, and which, it is believed, would prove to the entire satisfaction of any lady or gentleman who might be disposed to order them. The German Stocks and Asters especially are most superb.—The 20 Packets are neatly packed up in one paper, and will be sent free by post, to any part of the Kingdom, for 5*s.*

TO NURSERYMEN, FLORISTS, &c.

J. LINDEN, 74, Chaussee de Schaerbeek, Brussels and Luxembourg, begs to inform Amateurs and the Trade that his Catalogue of New Plants for 1851 is now ready, and may be obtained gratis of his Agents, Betham and Blackith, Custom House and General Forwarding Agents, Cox's Quay, Lower Thames-street.

J. L. solicits attention to the new and remarkable Orchideous Plants with which the Catalogue abounds, as also to the following, a description of which will be found on the first and second page:—

| | | |
|---|---|---|
| FUCHSIA VENUSTA, H.B.K. strong plants, | | 5s. to 7s. 6d. |
| FUCHSIA NIGRICANS, Linden | Ditto | 3s. |
| BOMAREA EDULIS | Ditto | 7s. 6d. |

VERBENAS.—A Set of Twelve of the most extraordinary Seedling Verbenas ever offered. As a proof of their excellence, they have been awarded 30 first-class certificates; three of them will be figured in the "Gardener's Magazine of Botany," April 1. G. S. begs to say that they are very distinct, and far surpass any previously raised. The set in strong plants, the third week in April, at 2l., or 5s. per plant. For descriptions, see Catalogue, which will be forwarded on the receipt of one postage stamp, with the description of the beautiful Fuchsia Sedonia, figured in the "Gardener's Magazine of Botany," for March. Also his new Petunias and Heliotropes. Selections, with prices of Verbenas, Fuchsias, Dahlias, Chrysanthemums, Geraniums, &c., at moderate prices.—George Smith, Tollington Nursery, Horn ey-road, Islington, London.

NEW VALUABLE FLOWER SEEDS.—Portulaca nova rosea, new Rose var., very handsome, 1s. per pkt.

| | | |
|---|---|---|
| Ipomœa Quamoclit alba, half-hardy | 1s. | " |
| " Burridgii, splendid hardy | 6d. | " |
| Saponaria Calabrica, var. multiflora | 6d. | " |

No garden should be without this most valuable Annual.

| | | |
|---|---|---|
| Martynia angularis, new and handsome | 6d. | " |
| Gloxinia, hybridised by a first-rate grower | 1s. | " |
| Calendrinia umbellata, new and handsome half hardy Annual | 1s. | " |
| A few packets of Lisianthus Russellianus | 1s. | " |
| Tropæolum speciosum, very handsome | 1s. | " |

Duncan Hairs' object, in selecting the above few Seeds from his collection, is to draw the particular attention of those who are fond of novelty and beauty. Amongst other departments of his business, D. H. prides himself on having some first-rate Seeds of Florist Flowers—viz., Calceolaria, Cineraria, Heartsease, Dahlia, Verbena, Carnations, Pink, Cockscombs, and Balsams, &c., in 6*d.* and 1*s.* packets.

German Stocks and Asters in collections, 2*s.* to 5*s.*

109, St. Martin's-lane, Charing Cross, London.

Catalogues per post free.

SEEDS FOR THE FARM, THE KITCHEN-GARDEN, AND THE FLOWER-GARDEN.

JAMES SALTER having tested the Growing Qualities of the Seeds he is now sending out, can with confidence warrant them to be as good, and as low in price, as at any respectable Seed Establishment in the Kingdom. All the most approved varieties of CUCUMBER and MELON, 1*s.* per packet. Flower Seeds forwarded (free) by post. Descriptive Lists, with instructions for sowing, sent on application.

N.B.—Just imported, a fine collection of CONTINENTAL FLOWER SEEDS; also, fine double ITALIAN TUBEROSES.

Seed Establishment 2, New Bond-street, Bath.

NEW SPRING CATALOGUE.

WOODLANDS NURSERY, MARESFIELD, near UCKFIELD, SUSSEX.

WM. WOOD and SON have now published a New CATALOGUE OF GREENHOUSE AND BEDDING PLANTS, copies of which will be forwarded free on application.

W. W. and Son beg to offer strong plants from their superb collection of Hollyhocks, at 6*s.*, 9*s.*, and 12*s.* per dozen; Cape Heaths, 9*s.*, 12*s.*, and 18*s.* per dozen, strong and bushy; Chinese Azaleas, 9*s.*, 12*s.*, and 18*s.* per dozen, strong and bushy.

Chrysanthemums, best Continental vars, 6*s.*, 9*s.*, 12*s.*; Phloxes, 6*s.*, 9*s.*, 12*s.*

Extra plants will be presented with each order, as compensation for carriage.

CUCUMBER "PHENOMENA," AND "BROMHAM HALL" MELON.

EDWARD TILEY wishes to inform the Nobility, Clergy, Gentry, and Growers in general, that he has still a Stock of good sound Seeds of the above superb CUCUMBER and MELON, and other varieties, as advertised by him in the *Gardeners' Chronicle* Feb. 22d, 1851. Cucumber Phenomena, 2*s.* 6*d.* per packet; Bromham Hall Melon, 1*s.* 6*d.* ditto; Fleming's Trentham Hybrid Melon, 1*s.* ditto; and about 20 other good varieties of Cucumbers and Melons, at the prices mentioned in the former Advertisement.

Any quantity will be sent postage free on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by Edward Tiley, Nurseryman, Seedsman, and Florist, 12, Abbey Churchyard, Bath.

STANWICK NECTARINE—SALE OF, IN AID OF THE FUNDS OF THE GARDENERS' BENEVOLENT SOCIETY.

Circumstances have rendered it necessary to modify the intentions expressed at p. 676 of the *Gardeners' Chronicle*, respecting the Stanwick Nectarine. Upon examining the young plants in Mr. Rivers's hands, it turns out that the number fit for sale is much smaller than was anticipated, and that there is a considerable difference in their quality. Applicants are moreover anxious to obtain their plants without loss of time, and without waiting for the chance of an auction which cannot take place, to the advantage of the charity, sooner than next spring. It has therefore been resolved to set aside the finest plants for sale at from 4 to 5 guineas each, and to dispose of others at 3 guineas each. Such as are unsold in the spring, if there should be any left, will be brought to the hammer as at first proposed.

Of the selected specimens, some are beautiful plants in pots, budded on the Peach stock, and covered with blossom-buds, so that they will fruit next year if repotted; for these five guineas will be charged. The remainder are very fine maiden plants in the open quarter, budded on Plum stocks, and without blossom-buds; for these 4 guineas are required. Gentlemen desirous of aiding the excellent charity to whose funds the produce of the sale of these plants will be applied, by order of his Grace the Duke of Northumberland, are requested to apply to Mr. William Brailsford, 21, Regent-street, London, giving their exact addresses, and stating by what conveyance the plants are to be transmitted from the station at Harlow, on the Cambridge line of the Eastern Counties Railway, where they will be delivered without further charge. It is requested that Post-office orders may be made payable to Mr. William Brailsford, who, upon their receipt, will return an order upon Mr. Rivers for the transmission of the plants.

Applications will be complied with in the *exact order* in which they are received, and due notice will be given when the five guinea and four guinea plants are exhausted.

May we be permitted to express a hope, that although no pecuniary profit can be derived by nurserymen from a sale whose proceeds go to a charitable use, yet that they will, nevertheless, endeavour to make known, within the circle of their customers, the terms on which the Stanwick Nectarine may now be procured.

SMART'S UNRIVALLED, DOUBLE, CRIMSON BRANCHING STOCK.

JAMES SMART, Seedsman, 56, Queen-street, Glasgow, can confidently recommend the above, as the best ever offered to the public for richness of colour and fragrant odour, combined with its graceful habit of growth.—Sold in Packets, at 5*s.* and 2*s.* 6*d.* each.

BLACK BARBAROSSA GRAPE.—Fine flavoured GRAPES may be obtained until April, by growing the above truly magnificent variety, introduced from the Continent by C. T. Ward, Esq. For further particulars, see *Gardeners' Chronicle*, March 8, 1851. Good Plants from Eyes may be obtained of John Butcher, Nurseryman, Stratford-on-Avon, 10*s.* 6*d.* each. London Agent, Mr. F. Warner, Seed Merchant, 28 Cornhill.

GRAPE VINES, strong and well-established in pots, of the following kinds:—Black Hamburgh, Black Prince, Muscadine, Sweetwater, Black Cluster, and Burgundy, at 18*s.* per dozen. Discount to the trade.

Thomas Watts, Camden Nursery, Camberwell, Surrey.

MESSRS. STANDISH and NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, March 15.

The Gardeners' Chronicle.

*SATURDAY, MARCH* 15, 1851.

MEETINGS FOR THE ENSUING WEEK.

IT is about two years since we drew attention to the very striking figures, published by Sir Wm. Hooker, of certain species of Rhododendron found in that part of the Himalayas which bears the name of Sikkim. Since that time Dr. Hooker has sent home such ample supplies of their seeds, that the Garden at Kew has been enabled to make liberal distributions, and many species are now in this country; among the rest the glorious sort named after Lord Dalhousie. The seedlings prove, as was to be expected, very different in constitution, and no doubt represent peculiar races, of which the management will be as different as the forms. While *Dalhousieanum* promises to be as cultivable as *javanicum*, others are so miffy, to borrow a gardening term, as to render it probable that they will survive only in the hands of the most experienced cultivators.

People are already being anxious about the names of their seedlings; but they turn in vain to the work above alluded to, which evidently contains a very small portion of those whose seeds have been distributed from Kew. We have, therefore, great pleasure in announcing that a second part of this publication has appeared,* and is to be succeeded by a third. From the second part, which contains 10 exquisite plates, we learn that Dr. Hooker has now acquired no fewer than 43 species in the mountains of Sikkim alone, "many of which exceed, in the size and beauty of their flowers or their foliage, the handsomest of those which had been previously discovered." The work also contains an enumeration of the 43 species referred to. We can only spare room for a few words respecting the 10 kinds actually figured.

The first plate represents *R. Aucklandii*, a species from the lower ranges, at the elevation of 7—9000 feet. It is a bush 4—8 feet high, with large Laurel-like leaves, green beneath, and huge white flowers, remarkable for a large broad red four-cornered calyx. It occurs in dry sunny situations, and above forests of Abies Brunoniana.

Next comes *R. Thomsoni*, with loose bunches of deep blood-red flowers as large as those of *arboreum*, but with the foliage of *R. campanulatum*, except that it is not rusty on the under side. It is found in damp woods, where it straggles to the stature of 15 feet, rooting from its branches.

Third in order is *R. pendulum*, a species with small white flowers, hanging from the branches of tall Pine trees, often covered with the Usnea lichen, at an elevation of 9—11,000 feet. "Growing, as it does, an epiphyte, upon the trunks of trees, in the gloomy and almost impenetrable forests, it is a plant very difficult of detection."

The fourth species is *R. pumilum*, a delightful Alpine species, with the habit of a Pyrola, and small

* *The Rhododendrons of Sikkim-Himalaya*, &c. By Joseph Dalton Hooker, R.N. M.D.; edited by Sir W. J. Hooker, K.H. Part II., Folio. Reeve and Benham.

bell-shaped flowers of the most delicate pink. It is described as "the smallest of the Sikkim Rhododendrons." Dr. HOOKER only gathered it twice, on Alpine slopes among moorland plants, "where its elegant flowers are produced soon after the snow has melted; and there its pretty pink bells are seen peeping above the surrounding short heath-like vegetation, reminding the botanist of those of Linnæa borealis."

Then follows, in No. 5, a striking contrast, in the form of *R. Hodgsoni*—a tree with ample leaves, silvery white beneath, and great rose-coloured flowers containing 18 stamens. This and Abies Webbiana are described as the characteristic underwood and tree at the elevation of 10—12,000 feet in all the valleys of Sikkim. It will probably be found one of the most cultivable of all the species. Cups, spoons, and ladles are made of its wood. "Nor is the foliage without its allotted use. The leaves are employed as platters, and serve for lining baskets for conveying the mashed pulp of *Arisæma* root (a kind of Colocass); and the accustomed present of butter or curd is always made enclosed in this glossy foliage."

*R. lanatum*, the sixth of the plates, again reminds us of *R. campanulatum*, but the wool beneath the leaves is white or tawny, and the flowers are pale sulphur colour. It is found "on the rocky spurs of the humid mountains and gullies, at an elevation of 10—12,000 feet."

*R. glaucum*, No. 7, is a delicate little species, about 2 feet high, with scurfy leaves, and pale pinkish purple flowers. The leaves are remarkably glaucous on the under-side, and the whole plant has a powerful resinous smell. It is from "rocky depressed ridges, at an elevation of 10—12,000 feet."

The eighth kind, *R. Maddeni*, has very large white flowers, and dark green sharp-pointed leaves covered with rusty down on the under-side. It has 18—20 stamens, and a faint perfume. It forms a bush 6—8 feet high, at an elevation of 6000 feet.

Finally, the work closes with *R. triflorum*, a yellow-flowered species, with scurfy leaves, something like the plant exhibited at the last Horticultural meeting, by Mr. HUSSEY's gardener, and *R. setosum*, a Box-leaved bush, looking like a Rhodora. This last inhabits extensive moorland tracts, and rocky slopes, at the height of 13—16,000 feet, and evidently belongs to a drier climate than the preceding. Dr. HOOKER says—"It is the Tsallu of the Sikkim Bhoteas and Thibetians, who attribute the oppression and headaches attending the crossing the loftiest passes of the Eastern Himalaya to the strongly resinous odour of this and of the *R. anthopogon* Wall. (Palu of the natives.) The species certainly abounds to within a few miles of the summits of all the passes, and after hot sunshine fills the atmosphere with its powerful aroma, too heavy by far to be agreeable; and it is, indeed, a sad aggravation to the discomforts of toiling in the rarefied medium it inhabits."

It is by studying details like those we have quoted, that gardeners will learn how to manage the species they have reared; and, we trust, that in the next part of this important work, the learned and indefatigable author, whose return from India is daily expected, will furnish cultivators with an abundance of similar information.

---

As we last week gave some account of recent experiments on the direct absorption of nitrogen by plants, and made some remarks on the conclusions which are attempted to be drawn from these experiments, we shall to-day say a few words upon the other side of the question generally, and especially in connection with some LATE INVESTIGATIONS OF M. MÈNE, which will be found at length in another column. Apart from the scientific or purely theoretical interest, the subject is important in its bearings on the preservation and employment of manures.

A few months since, Mr. WAY drew attention to the remarkable power which soils generally have of absorbing ammonia and its salts. It had long been believed that all porous soils possessed the power of absorbing and condensing ammonia from the air; it had likewise been long known that, in addition to this, which might be called a merely mechanical effect, certain soils possess the power of absorbing or fixing ammonia, in consequence of certain chemical agents present in them; and there was still further a number of curious isolated facts, all showing that the subject was not thoroughly investigated—facts, seeming to point to some physical or chemical property belonging to most soils, and in consequence of which they possessed these powers. Mr. WAY's experiments are very interesting, even though they cannot as yet be altogether satisfactorily explained; they show the great absorptive power which the soil has; they give us some evidence of the mode in which this power practically operates on the large scale, and, therefore, lead us to consider the effects in nature to which it must give rise.

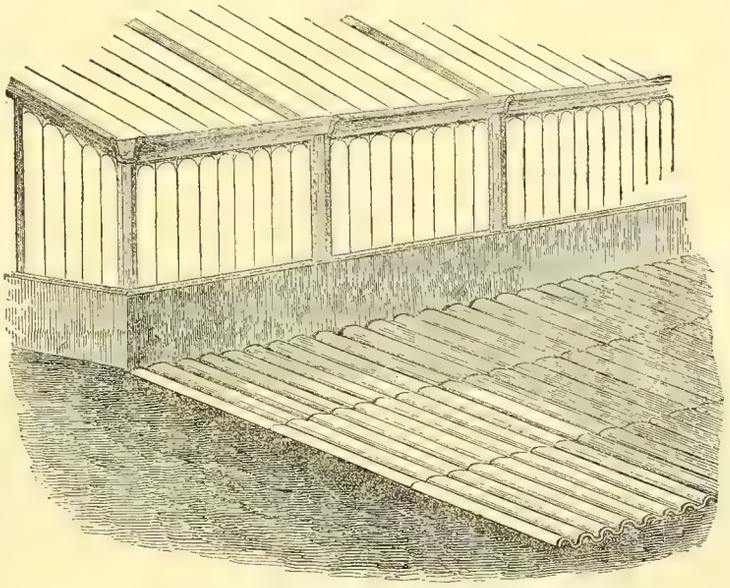
It appears, then, that most soils possess the power of absorbing a very large quantity of ammonia, so that if strong liquid manure, or a strong solution of ammonia in water, is filtered through a portion of soil, the ammonia will be absorbed, and the liquid which passes through will be found to contain no ammonia. It is plain, therefore, that the small quantity of carbonate of ammonia which rain-water usually contains, will be absorbed by the surface soil, and that in a very heavy shower of rain, sufficient to render the soil thoroughly wet to a considerable depth, there is no fear that the ammonia thus supplied to the soil will be washed away by the continuance of the rain. It is also evident that, when land is flooded, the ammonia which the water contains will be for the most part arrested by the soil over which it flows. The great fertilising effects produced in Egypt by the waters of the Nile, in its periodical floods, were no doubt partly due to this cause; the benefit resulting not from the small quantity of slimy mud which the water left behind, but from the saline matters which it brought with it, and which were absorbed and retained by the surface of the soil as the water flowed over it. Mr. WAY's experiments show that a good soil (one which contains a reasonable quantity of clay, which is essential to this effect) has the power of thus absorbing or fixing ammonia in whatever state that substance is presented to it; it is the same whether the ammonia is in its free and uncombined form or whether it is united to some acid constituting a neutral salt. In the former case the ammonia is directly absorbed, and the water passes off entirely deprived of it; in the latter case the salt appears to be decomposed under the influence of this peculiar power of absorption, the acid with which the ammonia was previously combined uniting to lime or some other base present in the soil.

Every fact of this sort certainly seems to supply fresh evidence as to the importance of ammonia to plants. We find that it is constantly present in the air, that it is from time to time brought down by rain, and that the soil possesses the very singular property of seizing upon it and fixing it in the most perfect manner. Again, this power does not belong to all soils indifferently; they must contain a portion of clay, or they are not thus able to absorb ammonia; pure sand possesses very little power of absorbing ammonia, and a soil consisting of nothing but pure sand is hardly able to support vegetation.

There is not much novelty in M. MÈNE's experiments, the chief objects of which are, to prove that salts of ammonia act beneficially on plants, and that certain substances have the power of fixing the volatile compounds of ammonia, and of rendering them not volatile at ordinary temperatures. It is well known that gypsum and various other salts do thus fix ammonia, and they are used very largely for that purpose; the chemical principles on which they effect this are pretty well understood, and are fully explained in most treatises on chemistry; but the preceding experiments of Mr. WAY seem to throw new light upon the subject, and though, of course, they do not in any way affect the mere chemical part of the subject, they nevertheless modify the conclusions which may be drawn from such facts to a very considerable degree.

M. MÈNE's experiments merely prove that the fumes which rise from fermenting manure, and which contain carbonate of ammonia, decompose gypsum, and convert a portion of it into carbonate of lime; as we have just observed, this statement is by no means a new one, but when the author proceeds to deduce from it the general conclusion that gypsum does not in any way aid vegetation, except by thus serving to decompose the volatile salts of ammonia, and render them fixed, his statement is not only new, but likewise somewhat illogical. It is one thing to prove that gypsum acts in the way described, but it certainly does not necessarily follow that it cannot act in any other way. A little consideration will satisfy any one that both lime and sulphuric acid are substances of considerable importance to plants; and hence it is hardly probable that they are only benefited by the absorption of ammonia, and not at all by lime or sulphuric acid. It is scarcely saying too much to assert that lime and sulphur are as essential to healthy vegetation as ammonia is; and although it is possible that other salts of lime may be more advantageous than the sulphate as sources of lime, yet there does not appear, generally speaking, to be any more available source of sulphur present in the soil than the sulphuric acid of gypsum. We consider, therefore, not only that M. MÈNE's experiments do not at all bear out his assertion, but further that a great number of known facts render it highly improbable.

In DAUBENY's lectures (1841), after giving some account of LIEBIG's views respecting the action of gypsum on plants, and referring to the mode in which it is decomposed by carbonate of ammonia, he observes, that the fact must always be borne in mind, that even when ammonia is thus fixed, it is not yet brought into a fit state to serve in the nourishment of plants, but that the salt thus formed must be acted on by some substances capable of effecting its decomposition, and of slowly and gradually liberating the ammonia which it contains. He considers that the plant itself cannot possibly effect the decomposition of such a salt; but this in fact is a mere matter of conjecture, as we have no evidence whatever as to what changes may or may not take place in the organs of a living plant; and if, as some chemists believe, the sulphur of plants is derived from the decomposition of sulphuric acid itself, it is hardly too much to suppose that plants are also able to effect the decomposition of salts containing that acid. The oxidation of ammonia, and the formation of nitric acid in the organs of plants, an effect which is very frequently observed, is not in any way a more surprising result.



There are a great many chemical transformations constantly going on in the soil, and sometimes in plants themselves, which at first appear to be in direct opposition to all known chemical facts, and therefore to depend on some new or little known interfering cause; some of the most singular of these are observed in connection with the fixing of ammonia. Chemists say that the carbonate of ammonia, which exists in manure, decomposes gypsum or sulphate of lime; a certain interchange of acids takes place between the two salts, to which they give the name of double decomposition, and the result is, that sulphate of ammonia and carbonate of lime are formed. This is perfectly intelligible, and the more so when we are told that it is caused by the fact that ammonia has a more powerful attraction for sulphuric than it has for carbonic acid. It appears, however, that there are certain exceptions to this rule, because in some cases it seems that just the contrary effect is produced; for when sulphate of ammonia and carbonate of lime are mixed together, a partial decomposition occurs, and more or less of the volatile carbonate of ammonia is produced. The fact is, that in many of these cases of double decomposition, the affinity of the several substances for each other is so nicely balanced, and so nearly equal, that it depends almost entirely upon external circumstances whether the salts are decomposed or not; thus, for example, there are many salts which will not decompose each other if they are mixed together dissolved in a quantity of water, but which nevertheless will act on each other if they are merely added to a portion of moist earth, and then left undisturbed in a damp place for some time. BOUSSINGAULT, in his "Rural Economy," has stated several remarkable instances of this sort of action. Thus he observes that when dry chalk and sulphate of ammonia are mixed together, they exert little or no influence upon each other, neither do they decompose each other if a considerable quantity of water is added; but if a quantity of moist sand or soil is added to the mixture of the two salts, they immediately begin to decompose each other, and carbonate of ammonia is given off. Now the practical conclusion which we must draw from these facts is, that mere laboratory results, or those which chemists deduce from small experiments, should be received with considerable caution; and we must always bear in mind, that unless all the conditions and circumstances are exactly the same, it will not do to compare such results with what occurs in nature. The result of Mr. WAY's experiments shows that the soil has not merely the power of absorbing ammonia and its carbonate from water, but also that it is able to arrest ammonia when the latter is already combined with sulphuric acid; and this very remarkable effect was observed, that when a solution containing sulphate of ammonia was filtered through a portion of soil, the ammonia was arrested and retained by the soil, whilst the water which passed through carried away with it the sulphuric acid. The same curious effect was also observed with nitrate and muriate of ammonia, the ammonia being stopped by the soil, whilst the acid in each case passed through dissolved in water and combined with lime. No chemist whatever could have predicted these very curious results, which appear to be in opposition to the usually received views of chemists respecting the nature of chemical affinity; they are illustrations of the manner in which chemical affinity is sometimes overcome or set aside by the mere physical conditions of the soil, and they teach us to hesitate ere we venture to assert that this or that particular thing cannot possibly be true, because it is in direct opposition to known chemical facts. We do not wish for a moment to question the value of sound chemical knowledge, every lover of truth must have a full respect for chemical facts; but we must take care

not to confound the facts of the observer with the conclusions which he may attempt to draw from them. There are few things more fatal to the advance of sound knowledge than hasty but ingenious generalisations founded on isolated or imperfect experiments.

## COVERING VINE BORDERS.

At page 54, some remarks are made on the use of materials (in lieu of concrete) for covering fruit tree borders; and among the articles named, are slate, zinc, and galvanized iron. Zinc, I should say, would be the worst metal that could be used; being so extremely sensible of expansion and contraction. I imagine it would require a covering to protect itself against frost in winter, and the sun in summer. "Galvanized iron," (if we are to have faith in the durability of the "patent process,") I see no objection to; but if used, I should strongly recommend its being "corrugated," the shape forming what in Mr. Paxton's language would be called a series of "ridge and furrow," or, in the language of the carpenter, of "hollows and rounds."

The slight inclination given to all borders would be sufficient to bring the rain-water down the "hollows," while the "rounds" would act as so many funnels, admitting air to the surface of the border. This, I think, would be an improvement upon "drain-pipes, which have been proposed for the admission of air." If it should be considered that this arrangement would admit of evaporation from the border, when such was not wanted, an easy remedy is at hand, which consists in placing iron plates with "tungs" to them, in front of the corrugations; this would at once seal up the whole affair into air-cells, but it will be evident to every one that it might be ventilated at pleasure by raising the plates. This plan, too, would not at all interfere with the "mulching" or covering the border, as the corrugated covering could at all times be removed and replaced with the greatest facility, in short, by any two garden labourers, however inexpert; for the "sheets" could not be put on wrong, and they would hold and fasten each other down "against wind and weather."

Some idea of the effect produced will be gleaned from the accompanying sketch. I imagine its appearance could not be considered offensive; inasmuch as every shower would wash it perfectly clean; and, the season permitting, the whole might be covered with pots; the corrugated iron possessing such resistance, that a plate, 11 feet long, by 2 feet 6 inches wide, and supported only across each end, will carry a ton weight!

If it should be deemed advisable that the proposed corrugated covering should be altogether raised above and clear of the border, the same simple mode of fixing would equally allow of this; and the air above the border might be kept confined, or in circulation, at the pleasure of the gardener. *John Jones, Harper's-hill Cottage, Birmingham.*

## MARKET GARDENING ROUND LONDON.

No. XI. Water-Cresses.—When the late Sir Joseph Banks came home from circumnavigating the globe, among the first things he asked for were Water-Cresses, so highly did he value them as a purifier of the blood, and so important did he consider them in this as well as in other respects, relating to the animal economy, that he presented one of our Water-Cress growers for Covent Garden with a Banksian Medal, in order to encourage him in carrying out their cultivation. I am sorry to state, however, that notwithstanding this, and although the plant is a native of Britain, and therefore easily cultivated, it is not half so extensively grown as it should be, there being only about four or five producers of it for the London markets, the main supplies for which are obtained from Springhead, Gravesend, Kent; Waltham Abbey, Essex; and from two or three places in Hertfordshire. The Gravesend and Waltham Abbey Cress grounds are far the best, more attention being paid in these than in the other places to its cultivation; this is apparent in the robust and healthy appearance of the stem, as well as in the leaf, which is broad, and has a brownish-green aspect. The supply of Cresses to Covent Garden every market morning, according to Mr. Steptoe, an old herbalist there, may be estimated at nearly 500 dozen small bunches. In the height of the growing season every greengrocer buys them for the tables of the rich; but the great consumers of this useful herb are the middle and lower classes, who get them chiefly through the medium of street vendors, who purchase 20 times as much as the greengrocers; and by taking so many they not only obtain them cheaper in the first instance, but when they get them home they make every market bunch into two or three, and in this way pick up a tolerable living. Cheap, however, as Water-Cresses are admitted to be, I consider them much too dear; and there is room for spirited individuals to form new Cress grounds, not the beds of small rivulets, but regular plantations on large slopes, with the land cut into canals, similar to the lamb grounds in many places. There is one of those early Grass producing contrivances at Mistley Hall, nearly two miles in extent, and occupying about 30 acres. This large space is capable of being all flooded at once, and for any length of time. Now this is the kind of Cress ground that I would recommend, and in such a place Cresses should be regularly planted, and as much attention paid to their growth as to that of any other plant. In this way, instead of the Grass and rubbish choked article now sold us, we would have Cress at least as fine again as that we at present receive.

I consider that no gentleman's establishment is perfect without its Water-Cress plantation. There is hardly a park which cannot boast of one of those crystal streams for which our country is famous, and a small piece could easily be enclosed and protected from cattle for Cresses; but there should be the means of shutting the river off, in the case of floods and heavy storms. The artificial canal system mentioned above would however answer best; for floods and heavy waters might then pass on in their natural course without disturbing the Cress beds. If this plan cannot be followed, then plant the bed of some stream, driving down stakes or laying large stones, so as to impede or lessen the force of the current. They would not be so fine produced in this way, but at the same time they would be plentiful enough to answer every purpose of a small family. Of this I am certain that no gentleman would object to have a Water-Cress bed for the use of his table, knowing its produce to be one of the most efficient purifiers of the blood and the very king of salads; and as far as the London markets are concerned, I am sure that if 10,000 bunches more than they already receive were brought every market morning they would be all sold.

In forming plantations, it would be necessary to have strong planks to walk upon, a few inches higher than the plants, so as not to trample on the latter, nor get wet-footed in picking them. In case of frost, it would be necessary to have plenty of water at command, in order to cover the plants well. The latter should always be raised from seeds, as, managed in this way, they do not "run" so soon, and by sowing at different seasons, we might have fine young Cresses all the year round. "But," I hear some one say, "you have provided for the wants of the wealthy, where is the amateur's bed?" Well, few small places are without water, and nothing need be easier than to introduce it into a nicely-formed trench, two or three feet broad, and to plant the Cresses. This trench might be hooped over, and covered with Roses, or some favourite creeper, and I imagine few spots in the garden would be found more useful or ornamental.

Since writing the above, the idea struck me that Water-cresses might be cooked like the tops of Radishes, and that they would make a useful addition to our delicate culinary vegetables. I therefore tried the experiment. The first time I cooked the stems and leaves together. They required but a few minutes' boiling, but the leaves were done long before the stems. The second time I had the leaves only, with a small proportion of the top stem, boiled in a little salt, and the result was a very delicate dish; but, like Spinach, it takes a good basketful to make one. For invalids and impaired constitutions, I am of opinion that it will prove a first rate vegetable. *James Cuthill, Camberwell.*

## INFLUENCE OF GYPSUM ON VEGETATION.

By M. C. Mène.

Ever since Franklin's great experiment, gypsum or sulphate of lime has generally been considered as possessing much fertilising power, and of being of great importance in agriculture. Having paid some attention to this substance, I make known my results, in the hope that they may be found of value to the public.

1. I filled two zinc boxes with pure sulphate of lime obtained from the double decomposition of sulphate of soda and chloride of calcium; in one of these boxes I sowed some Grass seeds, in the other some Wheat. The two boxes were then placed under glass shades, in order that all external influences might be avoided: the seeds were watered every other day. At the end of a few weeks plants had come up green and healthy, as in common soil; but as they developed, their fine appearance diminished, and at the end of a fortnight they looked dried and withered.

2. In boxes similar to the first I placed a mixture of equal quantities of pure sulphate of lime, obtained as before, and clay, and sowed the same seeds as in the last experiment; the plants came up, but not nearly so well as in an unartificial soil, and they did not ripen.

3. In boxes, and under circumstances the same as before, I sowed the same seeds on dung covered over with a layer of sulphate of lime three-tenths of an inch deep. At the end of a fortnight the plants had come up and grown wonderfully; they ripened well and were magnificent specimens.

These facts, though of considerable practical importance, would not have shown in what way sulphate of lime really acts, had it not been for the following accident:

Happening to have a glass of muriatic acid in my hand one day when looking at box No. 3, I accidentally spilled some of the acid on one of the boxes, and to my great surprise the lime effervesced, and on further examination I was satisfied that the sulphate had become changed into carbonate of lime. I concluded from this that the carbonate of ammonia, given off by the decomposition of the dung, being volatilised by the heat of the sun, came in contact with the sulphate of lime, when double decomposition ensued.

To ascertain how far this was true I got some zinc pots, with bottoms pierced like a sieve; in the pots I placed some dung, then some sulphate of lime, and then I sowed some Grass seed.

When the plants had appeared and become tolerably developed, I watered them abundantly for a quarter of an hour, and in the liquid which flowed from the bottom of the pots I found sulphate of ammonia, whilst on the surface of the pots there was evidently carbonate of lime. This confirmed the view I had adopted.

I then made other experiments, which do not however bear upon the last-mentioned facts. For example, I watered Grass seeds sown in manure, in pots with pierced bottoms, with water containing one of the following substances, viz., sulphuric acid, muriatic acid, nitric acid, acetic acid, sulphate of iron, sulphate of potash, chloride of manganese, phosphate of soda, sulphate of magnesia, nitrate of soda.

With all these substances the Grass grew well, and from the bottoms of the pots I obtained salts of ammonia, which are not volatile at the ordinary temperature. From all these facts I think we may conclude—

1. That gypsum has by itself no fertilising power, and is alone useless as a manure.

2. That gypsum is only useful in agriculture when mixed with substances containing ammonia; in which case there is a double decomposition, and the ammonia is stored up for the use of the plants.

3. That for gypsum may be substituted any other salt which will fix ammonia, and render it not volatile at the ordinary temperature.

It is my intention next year to repeat these experiments on a large scale, in order to ascertain their real practical value. *Comptes Rendus.*

## BRITISH SONG BIRDS.

(Cage Birds, No. 5.)

No. XXI. Let us now briefly comment on some of the little ailments of our winged friends. "Prevention being better than cure," we will hope that, by due care, we shall seldom have occasion to call in the aid of a doctor—my aversion always, excepting only *in extremis.**

The *diseases* to which a canary is subject, are but few; and they are, any of them, easily got rid of. The *husk* is a "dry cough," caught from an undue exposure to cold and damp. Sometimes it is brought on by giving your birds Hemp-seed; the husk or shell of which, adhering to the lining of their throat, causes inflammation. Never, therefore, give your canaries any Hemp-seed, without first bruising it. Half a dozen seeds per week, observe, are more than sufficient, under any circumstances. To cure the *husk*, feed your birds on yolk of egg, boiled hard, and diluted with a few drops of cold water. Mix with it a small quantity of sponge-cake, rubbed fine. Instead of spring water to drink, give them, for a couple of days, boiled Linseed-tea, flavoured with liquorice-root; or boiled milk, fresh each morning. By keeping your birds warm, and covering them over to prevent excitement, they will soon rally. The "pip" and other minor maladies, to which all birds are occasionally subject, will be treated of in a separate chapter. I need here only speak of "moulting."

* The accumulating correspondence which I am daily receiving, renders it needful for me to remark, once for all, that I never give advice on subjects with which I am not conversant. '*Ne sutor ultra crepidam!*' The diseases peculiar to *parrots, macaws*, and the whole of that tribe, are to me a "sealed book." The 'principle' of general treatment which I recommend for '*Song* Birds,' applies, however, in *many* points, to all the feathered race in confinement. Half the parrot-tribe are killed by over-kindness, or from an unthinking neglect of their proper and natural requirements. Their food is, for the most part, made too thin; it is seldom varied; and they are tormented into "talking," when tired Nature says "Nay!" Their masters persist in this course; their birds die; *et hinc illæ lachrymæ!*

When a canary "moults,"—which is generally in July or August, according to the heat of the weather—all you need do is, to keep him quiet and free from draughts. Being a cheerful, lively bird, there is no need to have him covered up, but do not let him be unduly excited. Give him a very small quantity of raw beef, scraped, and moistened with cold water, once a week; occasionally, a little yolk of hard boiled egg; and now and then a piece of sponge-cake, and ripe Chickweed in full flower. Nature will do the rest; and present your pet with a handsome new coat, that will keep him "spruce," and last him a full year. Mind and trim his claws, when they are too long. Use sharp scissors always; a knife, never. In handling him, let him lie passive as possible; so that your hand may not press unduly on any part of his little body. After the first operation, he will understand all about it, and cheerfully submit to be so "trimmed."

I already have taken occasion to speak of the docility of the canary, and have given several interesting anecdotes of his aptness to fall into his master or mistress' humour. To go further with our illustrations would occupy much room; and, at the same time, destroy the fond anticipations of pleasure, which no doubt many of my readers feel, at the thought of hereafter experimenting for themselves.

I will now proceed to speak of the various kinds of birds which should be selected for the purposes of breeding; and afterwards pursue the enquiry of rearing, feeding, &c., in all its ramifications; so that "he who runs may read," and he who reads may understand.

I have before noticed the GERMAN Canaries, as songsters; and confirmed the fact of there being *some* well-taught musicians amongst them. Beyond this, nothing can be said. They are *not* long-lived; and soon fall victims to the countless changes in this our variable climate. They are tender in constitution, and seldom live more than from two to three years in England. *These* birds, therefore, will not do for breeding-stock. Some English bird-fanciers (amateurs more particularly) have a great fancy for the Belgian canary. These birds are of gaunt proportions, and have a commanding presence. Their length is remarkable, and their spirits are exuberant. Their song, too, is musical, though excelled by many of our native birds. They are bred pure in Belgium; and the race is there kept up *in perpetuo*, to insure a healthy stock. *Suum cuique*: they are good nursing fathers and nursing mothers; and attend well to the wants of their offspring.

A very old friend of mine, some 10 years since, associated one of these *Jonque* birds (a male) with one of our Norwich mealy hen canaries. They took kindly to each other, and in a few short weeks became the happy parents of five remarkably-healthy children, of an undeniably beautiful plumage. The males turned out first-rate songsters; and being placed from their tender infancy under an eminent "tutor,"—the full meaning of which expressive word I shall have occasion to explain hereafter—they caused the heart of my good friend to rejoice. He was then past "the age of man;" soon afterwards he died, as he lived, surrounded by his pets. His *requiem* was chaunted by nightingales, woodlarks, black-caps, and canaries. Oh, how often have we both been "rapt," while listening to his minstrel choir!

I must not be understood as speaking in praise of the *beauty* of the Belgian canaries. They are not of fair, symmetrical proportions, by any means; but their Colossal size, and Herculean constitutions, impart increased vigour to any young birds proceeding from their family connections.

I have stated the average duration of a canary's life at from 16 to 20 years. This has reference *only* to a state of celibacy. Those birds, on whom devolve the cares inseparable from large and rapidly-increasing families, rarely live half that number of years; and it must be borne in mind, that the song of a canary, in wedded life, degenerates from the day of his espousals. He never afterwards sings so long together, nor so sweetly. In sober truth, his value as a "songster" is altogether lost. Hence the necessity, or rather the prudence, of selecting a male bird for his fair proportions, colour, and health, principally. As for song; never fear his progeny being found deficient in *this* matter. There are infallible methods of making them *all* first-rate, as I shall show.

One very great "vulgar error" that exists among the million, about the rearing of birds, requires removing. I mean their recognition of "February 14," as being the "pairing time" for birds, and the signal for "putting them up" in cages to breed. In such a climate as England, what is the necessary consequence of such a step? Why this: the hens build their nests, lay their eggs, sit their 13 days, hatch their young; and when the latter come forth, the chilliness of the weather either kills them at once, or compels them to be reared, like hothouse plants, in the close vicinity of a blazing fire. This fact fully accounts for the puny "apologies" for birds, which we see from time to time in the families where we visit.

The earliest period that common prudence would sanction for birds being "put up," is—the latter end of April. If perchance the month of May *should* prove fine and warm—we just remember such an occasional treat—why, then, your birds will thrive nobly; and you will not deplore your want of success. Nothing can be more galling to a lover of birds, after all his wariness, watchfulness, and anxiety—than to find his expectations cut off, and the whole process of incubation to have again to be gone through. I want to establish a *rational* mode of proceeding, and I trust my readers will kindly bear with me, while I so earnestly urge its adoption. *William Kidd, New Road, Hammersmith.*

## GRAFTING.

No. XI. SECTION IV.—GENERAL OBSERVATIONS ON BUDDING. (*Greffes en écusson.*)—Previously to commencing the operations connected with this series, it is necessary to examine the stocks, in order to ascertain whether their bark can be easily detached from their alburnum, otherwise we must wait till it will do so. Other considerations, not less important, merit some details, because on them the success of the buds generally depends. Calm weather should always be chosen; and the work should be suspended when the sun raises the thermometer above 78° of Fahrenheit.

We ought also to avoid performing the operation when the sky threatens rain; for this, in falling on the budded plants, filters into the wounds made in them, and mixing with the sap, instantly decomposes it, and the bud consequently perishes in a few days; thus rendering it necessary to recommence the operation, on the return of fine weather, and always on another part of the stock analogous to the first.

Budding is practised exclusively on woody plants, either on their stems or branches, of which the size may vary from the thickness of a quill to that of 3 inches in circumference. We may insert several buds on the same stem, either for making it fork, or for other purposes; or on branches, with the view of uniting upon them various species or varieties. I shall divide the different kinds of budding into two groups; the first comprising those with pushing eyes, *œil poussant*; the second, those with dormant eyes, *œil dormant. Translated from the French of D'Albret.*

## TRADE MEMORANDA.

INFORMATION is requested concerning Mr. John Cotchier, of 20, Carlisle-street, Hulme, near Manchester. Is he related to Mr. John Crane? or is he one of the firm of James Thompson and Co., of Holroyd-place, Pendleton? Probably some of our correspondents who deal in glass can tell.

## Home Correspondence.

*Begonia Fuchsioides.*—Mr. Culverwell says that "This plant rarely flowers well until the second year of its growth." But if Mr. C. will try the following system of managing it, he will both obtain good plants and a mass of bloom the first year. In January take off cuttings, insert them in equal parts of peat and sand, and plunge them in a good bottom-heat, with a bell-glass over them. In about three weeks they will be well rooted. Then pot them off into 5-inch pots, and place them again in a little bottom-heat, where they can have a moist atmosphere. In such a situation they will grow rapidly. Never allow them to become pot bound. The soil I use is three parts strong maiden loam, two parts Mushroom-bed dung, and one part sand, with plenty of rough charcoal intermixed. In this it will grow like a Willow. By July or August we have had plants at Raby Castle 6 feet high, and 3 feet through, covered with scarlet flowers. While in their growing state the shoots should be kept pinched in, which prevents them getting too gross and woody. They push out laterals plentifully, and from August till Christmas, and even after that, they will be one mass of bloom. Up to August they were grown in a stove, and were afterwards moved to the conservatory. Some recommend stunting them in small pots to make them bloom, but that process destroys the beauty of the foliage, and causes them to produce puny flowers. The pot in which they are to flower should be about 20 inches deep by 19 inches wide, and if grown properly they will require all that room. Never allow them to want water, of which they absorb so much in summer, or they will turn yellow. Being a gross feeder, you may water with soot water, or manure water, about in the proportion of 3 quarts to a 4 gallon can. If this is rightly followed out, you will be doubly paid for all your trouble, and that, too, during the first year. After they have done blooming, remove them to the stove, where they will soon begin to grow again; but in order to keep up a stock of fine healthy plants, I would recommend them to be struck cuttings every year, and treated in the manner I have just described. *James F. Roberts, Broomhill Gardens, Tunbridge Wells, Kent, March* 11.

*Conferva in Water-Butts.*—It does not appear to be generally known that by keeping a cover on a tank or vessel holding water, Conferva will not grow. The preventive is doubtless want of light. Be that as it may, however, merely covering has the effect of keeping the water perfectly clear. Of the efficacy of this I have had ample proof. *T. N. Egleton, Holm Hill.*

*Cement for Hot-water Tanks.*—I beg to state that brick-built hot-water tanks, cased with cement, never give way if the work be properly done. I have had tanks cased with the yellow cement, 5 feet wide, 24 feet long, containing a foot deep of water heated to 180°, and they never failed. The bricks of which they were constructed were also laid in cement. *J. Waldron, Woodend, Walsall, Staffordshire.*

*The Deodar.*—About 20 years have elapsed since the introduction of the Deodar into this country, and a number of specimens of it, of about that age, are to be found in our public and private gardens. Could some of your correspondents favour us with accurate measurements of the height and girths of these, together with the length of the lateral branches, where remarkable. Any information of the nature of the soil where they thrive best, if in a high and exposed, or in a low and sheltered situation, and other incidents, would also be acceptable. Some of the older plants, which I have seen, are very healthy and thriving, and evidently suit the climate of this country well, and the tree is worth all the attention which has been bestowed upon it. I am assured, on unquestionable authority, that in its native mountains it attains to the height of from 120 to 150 feet, and one was measured by Dr. Falconer, 36 feet in circumference, without its bark, at 3 feet from the ground. This, however, was the largest he had ever seen *W. L. M.*——I quite agree with you that a Deodar, or any other at first pendulous headed tree, ought not to be staked; the sap will force the leader up, if ever the tree will carry its leader straight. I have, however, a great many plants, now some years planted (the tallest is 12 feet high), which show the greatest disinclination to hold up their heads; the pendulous part is much more than the year's growth, and quite hard and woody, and can only now be forced straight by the application of considerable force. My query is, is it any use to stake such plants? or, rather, ought I not to conclude that there is something in their position, soil, or situation which is inconsistent with their due development? Even if I stake them now, they would soon be beyond the reach of stakes. They are planted in an old garden, with a conglomerate of limestone and red sand subsoil. Large Firs grow on this soil. *J. H.*—[We should cut out such specimens.]

*Mild Winters.*—Within the last 35 years there have been four remarkably mild winters—in the years 1822, 1834, 1846, and 1851—and the mean temperatures of the respective months were as follow:

| 1822. | | 1834. | |
|---|---|---|---|
| 1821. Dec., 44.2° | | 1833. Dec., 44.4° | |
| 1822. Jan., 39.1° | Mean, 42.4°. | 1834. Jan., 44.2° | Mean, 43.7°. |
| „ Feb., 43.6° | | „ Feb., 42.4° | |
| 1846. | | 1851. | |
| 1845. Dec., 39.5° | | 1850. Dec., 39.7° | |
| 1846. Jan., 43.3° | Mean, 42.2°. | 1851. Jan., 42.7° | Mean, 40.6°. |
| „ Feb., 44.0° | | „ Feb., 39.5° | |

In comparing these four winters, that of 1834 is the warmest; innumerable notes were made at the time of the extreme forwardness of vegetation. I quote some of these. "Jan. 20th. Spring flowers, such as Crocuses, Snowdrops, Primroses, Violets, Polyanthuses, Hepaticas, &c., in full flower. There has not been (up to this date), one frosty night." "Jan. 26th. The Almond tree in flower; early shrubs look green; Peach trees ready to burst the buds; and the Blackthorn in bloom. There are many instances of the Apple tree in flower in the west of England." "Feb. 28th. The wall fruit trees in full bloom; Gooseberry bush in leaf and in blossom; hedgerows green." "March 10th. The Pear, Cherry, Plum, and Apricot tree in blossom." The mean temperature of the winter of 1822 and 1846 were nearly alike; but the winter of 1822 was stormy and wet, and very unfavourable to the progress of early vegetation. In 1846, on the contrary, the weather was dry as well as mild, with much sunshine, and was next to 1834 in productiveness. The late winter has not been so extremely mild in comparison. The Crocuses and Snowdrops, and some of the Primula tribe, were not in flower till the middle of February, and as yet there is no appearance of green leaves anywhere. In conclusion, it may be interesting to give the number of actual frosty nights during each of the winter seasons in question. In 1822 there were 13 frosty nights; in 1834, 17 frosty nights; in 1846, 19 frosty nights; and in 1851, 31 frosty nights. Now, the mean numbers of frosty nights for the season, on an average for the last 35 years, is 38; and the mean temperature 38.2°. The past winter is then only 2° and 4-10ths above the mean, and the number of frosty nights fall short by only seven. *J. Henry Belville, 9, Hyde Vale, Greenwich, Kent.*

*Carnations in Pots.*—Independently of the sameness which is observable at most exhibitions of these flowers, by reason of the mechanical arrangement of cut blooms, too close for individual inspection, there is an evil which ought to banish them altogether from general shows; and which is this:—Place a box of flowers where you may, there will be assembled a group of ardent cultivators discussing the merits of some particular flower, to the entire exclusion of those who would be content with the ordinary flower and pass on. This is a nuisance at public shows. I do not say this in disparagement of the florist, far from it; I, personally, feel too much indebted to him for the great improvement he has made to mean any remark disrespectfully. The inconvenience is just as great to him as to others; he cannot stay by his favourite flowers as he would, because he has sense enough to know that he is preventing other people from seeing them; and, however long he may seem to others to be waiting, to him the time is not half long enough;—and what is the chief cause of all this? Simply the cramming or packing of 24 flowers into a box that not more than two persons can get a sight of at a time. Whoever was the author of the new mode of showing Carnations and Picotees in their blooming pots has done an immense service to the florist as well as to visitors in general. Instead of 24 flowers being now packed in a box which occupies 2 feet of table they will even, if placed side by side, be spread along 24 feet of frontage. Instead of being so low that one must stoop to look at them, they can be arranged so that we may see them in an upright posture; and there are advantages as regards effect which can hardly be estimated too highly. Plants may be exhibited, or, rather,

Pots of plants, with three or four blooms to each, and, more than this, if there be an abundance of pots; two ranges, one behind the other, properly elevated, will produce a grandeur of effect which can only be appreciated by those who have seen the collections properly arranged at the gardens of the cultivators. But they must be exhibited as plants, split pods—which there will be when half-a-dozen flowers are shown in a pot-full of plants—must be no disqualification; they must be shown for effect, and not according to the rigid rules of a stand competition. A florist makes the best display he can at home on his own stage, he does not throw away a flower for a trumpery blemish; a split pod, or a mean petal, or one with a crack in it, which not one in a hundred would notice, will never induce him to throw away a flower at home, and why should he at an exhibition? It must be obvious to everybody that what a florist would do at his own garden to produce the greatest appearance, he would like to do in public, where the object must be the same. I hope the judges on the occasion will be men of some mind, not persons of narrow views and notions, circumscribed by the rules of private shows, and that they will judge according to the health of the plants, the freshness, the colour, the size, and general form of the flowers. If I had my will in the matter—and I mean to be among the exhibitors—not one of the strict rules which may properly govern shows strictly and exclusively for those flowers, should be allowed to disqualify a stage of plants on the occasion. I would have no hunting for a run or a split petal, no strict examination to detect a damaged pod, and it is exceedingly desirable that the growers of Carnations and Picotees should know that such would be the case, because whoever attempts to cut away the most effective of his flowers to reduce the number to such only as would meet the critical examination of a florist inclined to put the rules for showing cut specimens in force against growing plants, will assuredly destroy the noble effect of his collection. I have ventured to throw out these hints to the parties concerned, and I hope they will induce others, who think with me, to say all they can in its favour. Florists may say what they like about the discouragement of "florists' flowers," but there never was a greater error committed than admitting them to the public general exhibition upon the conditions imposed on them at private shows. Look at half-a-dozen boxes of Pansies, a favourite flower, I grant, and one which always attracts notice. What lady or gentleman ever had a chance of seeing them long enough to make a memorandum of their names? They are cut and plaistered, as it were, on flat boards, 30 within the space of a yard frontage; and independently of the disguise which the mode of showing effects, and which makes a crumpled worthless flower appear flat, by habit, the confined space shuts out 19 of every 20 from even a transient view, while the stooping posture necessary to obtain a sight of their names, makes the enquiring visitor annoy those behind him as well as others, who feel they have an equal right to make a close examination, and hopelessly wait to obtain it; suppose these were shown in pots, and the names labelled to each so as to be read, there need not be 36 varieties, for that number is always obliged to include a good many that are useless; 12 well-grown plants in pots would be a sight worth looking at, and then florists' flowers would become a feature of importance. The time has arrived when most, if not all the florists' flowers, may be found worthy of a place at public general exhibitions, but they must be shown in pots. What trumpery collections do we see at many exhibitions? Verbenas in unmeaning bunches, which give the buyer no idea of habit, a dozen blooms of consumptive Pinks crammed into a box a foot square, a few weeping spikes of measly Antirrhinums, flat boards stuck all over with blooms of Petunias, or French Marigolds, and other mean and miserable flowers, which just answer the purpose of an exhibitor to get an admission for nothing, and crowd the tables with things unworthy of a stall at market, I rejoice in the changes introduced by the Horticultural Society. I say nothing of the number and amount of prizes, these are matters which do not affect my view of the question. *Argonauta.*

## Societies.

National Floricultural, *March* 11.—A preliminary meeting of this new Society took place to-day, at 21, Regent-street, for the purpose of completing its organisation and settling the days of meeting.

Botanical, of Edinburgh, *Feb.* 13.—The President in the chair. Several donations were announced. Dr. Balfour exhibited a specimen of Polysiphonia subulifera, new to Scotland, gathered at Lamlash, Arran, in August last, by Mrs. Balfour. Dr. B. likewise exhibited, from the Palm House of the Royal Botanic Garden, a flowering specimen of Livistona chinensis, taken from a plant 38 feet high (measuring from the floor, to the extreme point of the centre leaf). The lower portion of this Palm is 5 feet 8 inches in circumference. Above this point, the stem is covered to the extent of 10 feet by the bases of the fallen leaves, above which 54 large palmated fronds are fully expanded, besides numerous in various stages of development, and so arranged as to give the head, which is 20 feet in diameter, a somewhat globular shape. This Palm has three flowering spadices upright, the largest being 3 feet 6 inches long, and more branched than the specimen exhibited. It grows in a box 5 feet square, and 5 feet 3 inches deep, in soil composed of very rough brown loam, leaf mould, and sand. The following papers were read:—

1. *On the Composition of the Ash of Armeria maritima from different localities; with Remarks on the Geographical Distribution of the species, and on the presence of Fluorine (qu. Iodine) in plants in general.* By Dr. Voelcker, of Cirencester.

2. *Remarks on Diatomaceæ found in Peat from Cantyre.* By Dr. Balfour.

3. *Notice of a Lepidodendron found in Craigleith Quarry, and of a species of Dadoxylon discovered in the sandstone of Arthur's Seat.* By Mr. A. Bryson.

4. *Notice of several new Indian Plants.* By Dr. Cleghorn.

5. *Report on the state of Vegetation in the Edinburgh Botanic Garden*, from 13th January to 13th February current. By Mr. J. M'Nab. This communication embraced the following register of the periods of flowering of plants in the open air, as compared with the dates of the first flowering of the same species (in most cases the same individual plants) in the Botanic Garden last year.

| | Date of flowering. 1851. | Date of flowering. 1850. |
|---|---|---|
| Alnus glutinosa | Jan. 13 | |
| Eranthis hyemalis | 15 | February 14 |
| Primula vulgaris | 16 | 14 |
| Corylus avellana | 16 | 16 |
| Erica herbacea | 16 | |
| Galanthus nivalis | 17 | 11 |
| Lamium album | 18 | |
| Helleborus odorus | 20 | 14 |
| Geum pyrenaicum | 20 | March 22 |
| Leucoium vernum | 20 | February 18 |
| Vinca minor | 23 | 23 |
| Symphytum caucasicum | 23 | March 14 |
| Doronicum caucasicum | 25 | 2 |
| Crocus susianus | 26 | February 16 |
| Potentilla fragariastrum | 26 | 25 |
| Vinca major | 26 | March 11 |
| Tussilago alba | 26 | 12 |
| Lamium maculatum | 26 | 19 |
| Galanthus plicatus | 28 | February 14 |
| Daphne Mezereon | 28 | 22 |
| Tussilago nivea | 28 | March 2 |
| Knappia agrostidea | 28 | February 22 |
| Cerastium Biebersteinii | Feb. 1 | |
| Arabis procurrens | 1 | |
| Rhododendron Nobleanum | 2 | |
| Arabis iberica | 3 | |
| Crocus vernus, and varieties | 3 | February 26 |
| Berberis aquifolium | 3 | |
| Kalmia glauca | 3 | |
| Cerasus Lauro-Cerasus | 3 | |
| Symplocarpus fœtidus | 4 | February 18 |
| Symphytum tauricum | 6 | |
| Pulmonaria mollis | 7 | March 11 |
| Asarum europæum | 10 | 7 |
| Iberis sempervirens | 10 | 9 |
| Helleborus lividus | 11 | |
| Aponogeton distachyon (in open-air pond) | 12 | 14 |
| Sisyrinchium grandiflorum (Warriston Lodge) | Jan. 27 | 12 |
| Tussilago hybrida (Canonmills Cottage) | 25 | |
| Orobus cyaneus (Canonmills Cottage) | Feb. 5 | |

Alluding to the mildness of the season, Mr. M'Nab exhibited flowering branches of the Gooseberry and Pear from the open wall; and stalks of Rhubarb from the open border, measuring nine inches in length, exclusive of the leaf, from the gardens at Warriston Lodge. Dr. Balfour mentioned that he had received a letter from Dr. Johnston, of Berwick, in which he states that he is now convinced that the Anacharis alsinastrum found in the Whiteadder is of foreign origin. A letter was read from Mr. Parker, Torquay, noticing various instances which had been observed of the effects of lightning on trees; and mentioning the occurrence of Tilia europæa on a promontory in the sea near to Torquay, where he supposes it to be indigenous. Mr. M'Laren exhibited specimens of Erica hyemalis, Epacris miniata and nivalis, Cactus, Primula, Cydonia japonica, &c., prepared by dipping in wax melted in a steam bath. He found that the colour of the Camellia was destroyed by the operation; but he succeeded with all the other plants he had tried. Mr. Gorrie exhibited specimens of the woods of Quercus pedunculata and sessiliflora, grown in the glen above Crichton. H. Paul, Esq., was elected a Fellow of the Society.

Entomological, *March* 3.—J. O. Westwood, Esq., President, in the chair. A considerable list of donations to the library from the Zoological Society of London, the Royal Society of Brussels, the Entomological Society of Stettin, the Berwickshire Naturalists' Club, &c., was announced, as well as a collection of insects formed at Baltimore, U.S., by Mr. R. H. Spence; presented by W. Spence, Esq., F.R.S. The President announced that a new Part of the Transactions (containing the portrait of the late Rev. W. Kirby) was ready for delivery, as well as the address delivered at the anniversary meeting by the late President. Mr. S. Stevens exhibited a specimen of the Geometra catenaria of Drury, a native of the United States, which had been forwarded to him from Worthing, where it appears to have been taken alive; likewise specimens of a beautiful Longicorn beetle from New Holland, and a Brazilian species of Curculionidæ, from various parts of the body of which small, pointed fungi had grown. Mr. Douglas exhibited a stem of the common Rumex, excavated by an insect which had formed a series of cells in the burrows, each now inhabited by a white grub, most probably the larva of Cemonus unicolor. Specimens of five exotic species of beetles which had been captured alive in a warehouse at Glasgow, were presented by Mr. John Scott. Mr. J. F. Stephens stated that all of them were reputed indigenous species. The President exhibited drawings of a larva found within a cocoon, in the pods of the common Furze, which he considered to be that of a small Hymenopterous insect, parasitic upon Oxystoma ulicis. Also drawings of the larva and pupa of a species of Apion found within the pods of Lathyrus arvensis. He likewise stated that two of the rein-deer in the Zoological collection in the Regent's-park had been attacked by a species of Œstrus, most probably Œ. Tarandi. He also read descriptions of several new exotic beetles and butterflies. A paper by Mr. H.W. Newman, of Stroud, was read upon a hornet's nest constructed within a bee-hive, which, together with the queen-hornet and her young, was presented to the Society by the writer. Mr. Stainton exhibited a remarkable Lepidopterous insect intermediate between the Tineidæ and Crambidæ taken among Rushes at Hammersmith by Mr. S. Stevens, of which he read the description. He also exhibited a new British Tinea from the neighbourhood of Liverpool. The description of another new Microlepidopterous insect, from the neighbourhood of Morpeth, was also read by Mr. Logan.

Royal Dublin, *Feb.* 28.—Mr. Bain, of the College Botanic Gardens, detailed the result of an interesting experiment which he had lately performed, with a view of propagating plants from their leaves. The experiment, which was tried upon the "Dionœa muscipula," or fly-trap, in the first instance, consisted in cutting off several leaves above the situation of the auxiliary bud, and placing them in a pot of damp moss, with a pan of water underneath, and with a bell-glass for a cover. In a few days a considerable number of tiny plants made their appearance, which, as soon as they had grown to about half an inch in length, were potted off in the usual way. Professor Allman remarked, that having watched the progress of the experiment described by Mr. Bain, he was quite satisfied as to the complete success which had attended it. Dr. Mackay, Dr. Scouler, and other gentlemen, then entered upon a discussion of the scientific questions involved in the subject, and Mr. Bain was complimented on the successful issue of his experiments. *Dublin Advocate.*

## Garden Memoranda.

Royal Gardens, Frogmore.—We learn that the beautiful Amherstia nobilis has flowered at Frogmore. The first raceme was taken to Buckingham Palace on the 7th inst., and we anticipate that another will have expanded before this time. In the cultivation of this plant, Mr. Ingram has found it necessary to constantly shade it from the rays of the sun, otherwise the young pendulous leaves are apt to get their edges scorched. It grows luxuriantly in a moist heat of from 65° to 70° Fahr.; it likes a good supply of water, and sometimes a little manure water.

Messrs. Veitch's Nursery, Exeter.—We understand that the Victoria Water Lily has been blooming here for these three weeks past, during which time it has produced 9 blossoms. To Messrs. Veitch, therefore, belongs the credit of having first flowered this interesting plant in a nursery. It occupies a tank 15 feet long by 12 feet broad, and has 7 leaves on it, some of which are reported to have been upwards of 4 feet in diameter. The water in which it grows is kept in continual motion, by means of the revolutions of a small wheel. Flower buds continue to make their appearance, and in all probability there will be a succession of blooms for some time to come.

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

Plants which have been recently potted should be kept in a somewhat closer atmosphere, with shading during the hottest part of the day in fine weather; but the latter should be very cautiously used, and only when the plants would be liable to flag without such protection. Heat and moisture may be applied more freely to plants which are in progress; and for the sake of economy in furnishing the necessary amount of heat, retain as much as possible of that generated during the day, by closing the house early. Let those plants in the greenhouse which are flowering, or approaching that state, have the most prominent situations, and be liberally supplied with water. Geraniums, Fuchsias, and other soft-wooded plants, whose flowers will not be required for the next two or three months, should be kept in a healthy growing state, by shifting them into larger pots, using a rich compost, in order to obtain fine plants in moderate-sized pots. Let the training of the plants have due attention, as their appearance depends as much upon this matter as upon the colour or shape of the flower. Those which are required for present display, should neither be stopped nor repotted, but nourished with occasional waterings of liquid manure, if they have filled their pots with roots. Attend to the propagation of greenhouse plants, particularly of Fuchsias, for autumn, and Chrysanthemums, for winter display. As Cinerarias go out of bloom, let them have a few weeks' partial repose, to prepare them for commencing their new growth with increased vigour. Seeds of Cinerarias, Calceolarias, Petunias, Humeas, and other soft-wooded greenhouse plants, should now be sown in a gentle heat. As Orchids show that they are about to commence their growth, they should be removed to warmer quarters, and syringed more freely. Those plants which are now growing should be encouraged by a more liberal supply of heat and moisture. Dendrobiums, Stanhopeas, and many of the stronger growing kinds, will make a good growth if suspended in a Vinery, where they will be partially shaded by the Vines; indeed, Dendrobiums generally do as well in a

late Muscat-house, all the year round, as in the Orchid-house. Camellias, which are beginning their growth, may be removed to Vineries or Peach-houses now at work; they will there set their buds early, and may be expected to flower about next November or December, at which period they are generally very acceptable.

FORCING DEPARTMENT.

PINERIES.—Where Pines are grown on the pot system, shift such plants as require it into larger pots, using three-fourths peat for the youngest plants, and increasing the proportion of loam as the plants advance towards the fruiting state. If the bottom heat is supplied by fermenting material, it will require to be frequently examined, to see that the heat does not decline, and thereby check the plants while in an active growing state. Equal caution will be necessary to prevent an excessive or burning heat, which will materially injure the roots, and very probably throw the plants into fruit, whether they are wanted or not. The object should be, to maintain, in all cases, a steady bottom-heat of 80° or 85°. A little air at the back should be left on night and day, excepting in frosty or windy weather, and for an hour or two on fine afternoons, when the pits are closed and syringed. Assist Pine-apples whose fruits are swelling, with clarified liquid manure, but give no water of any kind after they begin to change colour. The manure water should be made in a tank, and clarified by adding some lime or coarse charcoal; as soon as the liquid has become clear, it should be drawn off into a second tank, the top of which is nearly on a level with the bottom of the other one. FIGS.—Let the amount of air to Figs in progress be gradually increased, using the syringe in fine weather to keep the red spider down; but it is necessary to avoid excessive use of this instrument, as too much moisture frequently causes the swelling fruit to turn black and fall off. An equable moderate state of moisture should be maintained about the roots, as the same misfortune not unfrequently results from extremes of drought and moisture. Stop the young growths at the fourth or fifth eye, by breaking (not cutting) the points out, as they do not, if broken, bleed so much. As the stopping of the young shoots goes on, look carefully into the state of the older wood; and where they stand too thickly to admit of the healthy development of the foliage, remove a few at a time of those shoots which seem the least likely to be fruitful. This will be carrying out the principle of summer pruning, or rather thinning, to the fullest extent; and with no tree is it more requisite. It is, however, important that it be done gradually, otherwise it will cause much bleeding. We may remark here, that Figs have generally too much root room. They bear best when on a shallow soil, resting on chalk, or when the roots are confined.

FLOWER GARDEN AND SHRUBBERIES.

Those who do not possess a sufficient extent of glass frames for the propagation of Verbenas, Calceolarias, and other half-hardy bedding plants, may make a splendid display by masses of the more durable annuals, sown in the places in which they are to remain. It is not to be expected that their beauty will be as permanent as that of the plants for which they are substituted, but with proper exercise of taste in arranging them, the result will be much more satisfactory than many suppose. For white beds use Clarkia pulchella alba, Nemophila atomaria, or white Virginian Stock; for pink or rose colour, Clarkia p. rosea, Saponaria calabria, or rose Virginian Stock. For yellow or orange, few things make a more splendid bed than Eschscholtzia for summer and early autumn; but if it be more desirable to make a late autumn display, the different varieties of Marigold are excellently adapted for the purpose; although as their peculiar odour is not in general esteem, they should not be planted too close to walks which are much frequented. If the situation is not too shady, the common Mimulus moschatus is well adapted for a compact dwarf bed of yellow. For blue beds use Nemophila insignis, Lupinus nanus, the late blue Forget-me-not, or the beautiful but rather scarce Centaurea depressa. For dwarf scarlet beds, Verbenas or Geraniums are indispensable, but a taller bed may be made of Pentstemon gentianoides; the different varieties of Antirrhinum majus are also very useful, particularly the dwarf early-flowering double-white variety: the taller and later kinds may easily be made dwarfer by pegging them down. For a purple bed, nothing surpasses the branching Larkspur, if raised from seed on a border planted out 12 inches apart, and pegged down twice during the growing season. The other annuals mentioned above may be sown at once in their places, and thinned out to proper distances. Musk and Forget-me-not are hardy perennial plants, as are also the Antirrhinums and Pentstemons in most parts of the country. The time for sowing annuals must be regulated by the period at which the greatest display will be most useful; and as this will generally vary from the middle of June to the middle of September, the seeds should be sown from the middle of March to the end of June.

FLORISTS' FLOWERS.

Some people will say it is early enough to pot off Carnations and Picotees, "*we say*" if the plants are hardy, and the compost is right, the sooner the better—the amateur must however recollect that there is nothing like planting the layers *fast*; if there is plenty of drainage (which there ought to be) the layers should be well fastened in the pots. This is an essential point, but too often overlooked. Seedlings that have made extravagant growth, should be cut in, leaving one or two good leaders,—we have seen both these and seedling Pinks left "*au naturel*;" the consequence has been that 50 flower stalks have been thrown up, and the strength that ought to have been concentrated in some six or twelve flowers has been disseminated in 50—even more than that; another good result from early cutting in the side shoots is, a large quantity of healthy layers are made, and should the seedling turn out good, they prove a tolerably good harvest to the raiser. TULIPS must be taken care of; we anticipate a move in the right direction with these splendid flowers this season. Continue to give all possible air to Auriculas, and water more frequently than usual.

KITCHEN GARDEN.

The importance of appearances in everything connected with a garden should be particularly borne in mind in the management of this department, as a considerable quantity of the work is of such a nature as to give at times an unsettled and somewhat untidy appearance; and, as the majority of these operations must be performed strictly in season, they do not leave the manager power to wait till his employer's family takes up its quarters elsewhere for a short period; and he must therefore do his best to keep the place neat and orderly, without suspending the work. Much may be done towards keeping things at all times creditable, by a systematic arrangement of the work, and by a steadfast adherence to the simple rule of doing everything well which is taken in hand, and finishing it off in a workmanlike manner before proceeding to another job. This mode of carrying on the work is the most satisfactory, as it allows of concentrated force and greater energy being devoted to that which is still to be done. Let the various quarters, as they receive their crops, be neatly finished off by raking or forking the ground, straightening the edges of the paths, and cleaning and gravelling the principal alleys. After these, the main walks in the immediate vicinity, which will be free from dirty traffic for some time to come, should be cleaned, slightly surfaced with new gravel, and rolled; and at the same time the edges of all the walks should receive any attention which they may require, either by replanting, or thoroughly repairing them. If Thrift is used as an edging, about one-half of it should be taken up, and replanted every season, as it wears a very unsatisfactory appearance, if allowed to remain undivided for more than two years. Forward Cauliflowers should have some good rotten dung forked in about them, and the soil drawn up round their stems; and if the ground is not over moist, they should be watered with liquid manure. Make new plantations of Strawberries where such are required, making the soil good at least 18 inches in depth, by working in some well-rotted manure; if the soil is light, a good dressing of marl will be very beneficial.

State of the Weather near London, for the week ending March 13, 1851, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 19th and 20th, 1836—therm. 69 deg.; and the lowest on the 17th, 1850—therm. 17 deg.

## Notices to Correspondents.

TO OUR CORRESPONDENTS.—May we beg it to be understood that *we cannot answer inquiries privately through the post*. We are ready to give reasonable information through our columns, but we cannot consent to the labour of writing letters.

AQUILEGIA: *C E A*. Sow your seed in a shallow pan now, in light sandy loam, and place it in a cold frame; or, if you have it, in a very slight bottom heat.‡

BACK NUMBERS: Full price will be given for No. 44, 1850.

BOOKS: *J J*. There is no separate publication concerning the art of cooking vegetables, except a small work by Rogers, which appeared some years since. Brief directions on the subject will be found in Paxton's "Cottager's Calendar."—*Con Amore*. It is impossible that *good* coloured figures should be given in cheap books. You had better trust to uncoloured representations, deriving your knowledge of the colours from the letter-press.—*A Learner*. Endlicher's "Genera Plantarum."

COTYLEDON UMBILICUS: If *H M*, who has inquired for this plant, will communicate with Mrs. Harrison, Springfield, Liscard, Liverpool, that lady is so kind as to say that she will assist him.

FRUIT TREES: *J E M*. The Duchesse d'Angoulême is best from the open ground; therefore your best plan will be to remove your tree from the wall, and train it as an espalier. Although it does not ripen its fruit, trained closely against a south wall in your climate, it may do so as an espalier, provided you do not make the soil too rich. Training the branches 3 or 4 inches from the wall will not improve it.‖

HARDY FERNS: *H*. If you can give them shade, such as would be afforded by good sized lumps of stone, any of the North European or North American species should succeed with you in the west of England. Your situation being dry, you will, however, have the more occasion to shade the roots and crowns of the plants in some such way as we have mentioned. Moisture and shade are the two main elements of Fern culture, and you should secure them to some extent, if you wish success. Plant such kinds as Lastrea oreopteris, Filix-Mas, dilatata, rigida, Goldiana, marginalis, intermedia, noveboracensis; Polystichum acrostichoides, aculeatum, angulare; Cystoperis bulbifera; Woodsia obtusa; Asplenium Adiantum-nigrum; Athyrium Filix-fœmina (as cool and shaded as possible); Scolopendrium vulgare and its varieties; Struthiopteris germanica, pennsylvanica; Onoclea sensibilis; Polypodium vulgare and its variety cambricum, Dryopteris, and calcareum. These will produce some effect. You can add the smaller curiosities afterwards, if you desire them.*m*

HEATING: *J S*. You will find sheet lead to be a much better material than zinc for lining hot-water tanks. See an article on the subject in another column.‡

INSECTS: *C E H N*. The insects which have destroyed your Cucumber leaves are a very minute species of mite, allied to the red spider. Fumigation in air-tight situations would surely kill them; but as it is not easy to prevent the escape of the smoke, we advise you to try whether they may not be decoyed by slices of Turnip laid near the plants. *W.—F A P*. The grubs are the young state of a two-winged fly, Bibio febrilis. We do not think them likely to be injurious, especially as they will turn to perfect flies, as soon as spring commences. *W.—Amator Naturæ*. The small grubs which attack the roots of the Clover are the larvæ of some species of weevil, whose history has not yet been recorded. We shall be glad of more specimens uninjured, to observe their habits. *W.—Mrs D (Holton)*. The insects which have attacked the leaves of your Cucumbers are a species of thrips, which may be destroyed by thorough fumigation, to effect which each plant ought to be inclosed in a separate frame or cover. *W*.

MELONS: *S E*. You must grow your Cassabar Melon like a Persian. But you will probably find it very far below your expectations.

NAMES OF FRUITS: *F H L*. 1, Dumelow's Seedling; 2, Bedfordshire Foundling; 3, Sturmer Pippin; 4, Beauty of Kent; 5, Herefordshire Pearmain; 6, Alexander; 10, Probably Alfreston; 12, Ribston Pippin.‖

NAMES OF PLANTS: *W W*. Some old variety of Azalea nudiflora.—*W L*. Nicotiana glauca.

NEW FRUITS: *W T*. Are not the reports on new fruits and vegetables published from time to time by ourselves, or in the Journal of the Hort. Society, sufficient? Kitley's Goliath Strawberry is reported to be an improvement on the British Queen, inasmuch as the plants are hardier and more productive; and if that allegation should prove to be correct, it will certainly be a most valuable variety. We believe Mr. Myatt, of Deptford, who has tried it, speaks favourably of it. Try the Esperione Grape; it is the best of the large sorts for the open wall.

OAK TIMBER: *Cultor*. It is a rule with us not to give legal opinions. We must therefore beg that what follows may be regarded as a mere memorandum. We are not aware of the existence of any special penalty attached to felling and selling Oak timber in winter with the bark on; such an act, if done by the owner, is not to our knowledge illegal, and if done unlawfully and maliciously by any other person, he would be punishable under the 7th and 8th Geo. IV., c. 30, secs. 19 and 20, which regulate the laws relating to malicious injuries to property, and which may be found in "Burns' Justice," vol. iii. p. 845, 28th ed. We believe this to be an answer to your question; if not, we must advise you to consult your solicitor.

PEAT CHARCOAL: *Y Z*. The best information to be found about it is contained in Mr. Cuthill's reports published in this journal. It is a much better material than wood-ashes, and acts in a different manner.

PRIVILEGES OF FELLOWS OF THE HORTICULTURAL SOCIETY: *S St M*. We do not see how the announcement of privileges can be made more clear. The following, however, is another form of stating the fact:—1. Fellows have free admission to all, including the American exhibitions. 2. Fellows may buy 48 admission tickets to the three exhibitions in May, June, and July, at 3*s*. 6*d*. each, instead of 5*s*. each. 3. Fellows have the *entrée* at half-past 12, and may introduce one friend at that time; if the latter is provided with the usual ticket. 4. If a Fellow cannot personally avail himself of the *entrée*, it may be transferred to a wife, or a sister, provided that wife or sister produces the usual ticket, signed by the Fellow whom she represents. 5. The public is not admitted till *two o'clock*.

ROSES: *W M*. The varieties of Roses best suited for your purpose, viz., to obtain the greatest effect during the months of July, August, September, and October are—Chinese: Belle de Florence, cherry; Belle Emilie, blush; Fabvier, crimson. Bourbon: Armosa, pink; Mrs. Bosanquet, flesh; Queen, salmon buff; Charles Souchet, purplish crimson. Noisette: Le Pactole, yellow; Aimée Vibert, white. This list is given on the supposition that you plant each bed with a distinct Rose. The strongest grower, Aimée Vibert, should be placed in the centre of the group. If the beds are large, it will perhaps be better to plant them with mixed kinds. It is a matter of taste whether dwarf or dwarf standard Roses be used, we prefer them on their own roots. The Lady of the Lake is not so hardy as some kinds. Marquise d'Ivry is a good pillar Rose.‡

ROSE GIRDLES: *Y Z*. We do not think these open to the objections you suggest. You appear not to be aware that it is necessary to pack matting, or hay, or some such material, between them and the stem of the tree.

SALTING ASPARAGUS: *J S C*. You may give as much as 20 lbs. to a rod. Apply it after the plants have begun to grow in spring. The Belleisle Cress is an esculent, but not esteemed, and out of fashion.‡

SUGAR: *G N*. The following are the books to procure on this subject:—"The Art of Manufacturing and Refining Sugar, including the Manufacture and Revivification of Animal Charcoal." Folio. By John A. Leon, Manufacturer and Refiner. Wm S. Orr and Co., 1850. "The Practical Sugar Planter." By Leonard Wray. 8vo. Smith and Elder, 1848. The article "Sugar" in Ure's "Dictionary of Arts and Manufactures," is good as far as it goes. (1845.) N.B. There is also a book which is published, or will be very soon, by Dr. Knap (German), on the chemistry of articles of food. This will be very good.

MISC.: *A Country Lady*. We regret our inability to assist you in your inquiries.

## SEEDLING FLOWERS.

CINERARIAS: *J D*. The two light-coloured ones are the best, but they are all inferior to the varieties cultivated about London. None of them are worth naming.*

LAURESTINUS: *G G*. Your seedling is certainly different from the common kind; but it is not so handsome, inasmuch as the flowers have no red in them.

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS,

AS THE

ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by Dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

PHOSPHATE NODULES, OR COPROLITES AND FOSSIL BONES (from the Suffolk Crag).—Manufacturers of Superphosphate of Lime can be supplied with the above, either in their natural form or finely pulverised, on the best terms, f. o. b. or delivered in the Thames.

Applications to EDWARD PACKARD, Chemist, Saxmundham, Suffolk, will receive prompt attention.

IRISH PEAT CHARCOAL.

TO FARMERS, AGRICULTURISTS, AND OTHERS.

MESSRS. ODAMS AND PICKFORD, 35, Leadenhall-street, having been appointed by the IRISH AMELIORATION SOCIETY sole Agents, for London, for the sale of their PEAT CHARCOAL, beg to say full particulars of prices, &c., may be obtained on application to them.

ODAMS and PICKFORD, 35, Leadenhall-street, City.

DESICCATED ANIMAL MANURE.—This Manure, which has proved so eminently successful in the culture of both Cereal and Green Crops, can now be had of the Manufacturers, J. M'CALL and Co., 60, Spring Gardens, Manchester; RITCHIE and M'CALL, 137, Houndsditch, London; and of all Agents. Price 7l. per ton.—Copies of Analysis and Testimonials forwarded post free on application. Agents wanted.

PATENT CREOSOTED FISH FOR MANURE.—This manure is composed entirely of animal matter. The analysis of an eminent chemist states that one ton of the prepared fish contains 263 lbs. of ammonia, 150 lbs. of phosphate of lime, and 39 lbs. of potash. It will be seen that they contain all the manuring properties of the best guano, and as they cannot be adulterated, they will be found to be a most useful manure for Potatoes, Wheat, Oats, Carrots, and all root crops. They also have the property of preventing the Potato disease. All the Potatoes planted with them last year, produced good crops, and were entirely preserved from the disease, although the neighbouring fields greatly suffered. See Report of the Royal Agricultural Society of Dec. 11, 1850. Price 5l. per ton. Orders received by Mr. HENRY HILL, Corn Exchange, Mark-lane; Mr. GEORGE BUSH, 22, Abchurch-lane; and Mr. BENNETT, 73, Mark-lane, London.

HOSE FOR LIQUID MANURE, Fire-engine, and agricultural purposes, made of canvass, lined and coated with gutta purcha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure, it is extensively used at the Government public works; also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25l. per ton, and Rich Purple-brown, 20l. per ton.—Offices of the Company, 1, New Broad-street, London.—JOHN A. WEST, Secretary.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

PURCHASERS OF AGRICULTURAL SEEDS are recommended to peruse Messrs. SUTTON'S NEW PRICE LIST, which appeared in the last page of the *Gardeners' Chronicle* of March 1st. The advantages Messrs. SUTTON are enabled, by their extensive trade, to afford agriculturists in supplying *genuine home grown Seeds at the low prices therein quoted, and free of carriage*, will doubtless be appreciated in these times of economy and agricultural improvement. The following are a few of the articles therein enumerated:—

| Per lb.— | d. | Per bushel— | s. | d. |
|---|---|---|---|---|
| Mangold Wurzel ... | 6 | Giant Saintfoin ... ... | 10 | 0 |
| White Belgian Carrot ... | 9 | Dickinson's improved Italian Rye-grass ... | 7 | 6 |
| Fresh imported Lucerne ... | 9 | True Perennial ditto ... | 7 | 0 |
| Parsnip ... ... ... | 9 | Common ditto ... ... | 5 | 6 |
| Ashcroft and other Swedes | 9 | Summer Vetches ... | 6 | 6 |

Reading Seed Warehouse, Reading, Berks.

PRIZE MANGOLD WURZEL, SWEDE TURNIPS, &c. JAMES GROVE, GREAT BADDOW, ESSEX, who obtained Prizes at the Chelmsford and Essex Agricultural Show for nine years in succession, begs to state that his Seeds, grown from selected roots, not plants, may be obtained of him, or of Messrs. PHILIP HARE and Co., 26, Mark-lane, London. He begs to call attention to the following opinions of the press: "The roots shown by Mr. JAMES GROVE stand unrivalled."—Smithfield Club Show, 1848; *Mark-lane Express*. "The roots shown by Mr. J. GROVE are allowed to be the best specimens ever shown, some measuring 36 inches in length, and weighing 20 lbs."—Smithfield Club Show, 1849; *Ibid.* "The chief merits of these roots are their great length, and growing not more than three inches in the ground, with very small tops."—Smithfield Club Show, 1848; *Bell's Weekly Messenger*. "The roots shown by Mr. JAMES GROVE were pronounced by many practical judges to be the most perfect specimens they had ever seen."—Smithfield Club Show, 1849; *Ibid.*

COCHIN CHINA FOWLS.—A few FIRST-RATE Birds for Sale. The largest Cock weighs 10½ lbs., and the largest Pullet 8 lbs. 7 oz. Price 5l. a pair.—Address A. B., at the Office of this Paper.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24-inch wide ... | | 7d. per yd. | 5d. per yd. |
| 2-inch " strong " ... | | 9 " | 6½ " |
| 2-inch " extra strong " ... | | 12 " | 9 " |
| ¾-inch " light " ... | | 8 " | 6 " |
| 1¼-inch " strong " ... | | 10 " | 8 " |
| 1¼-inch " extra strong " ... | | 14 " | 11 " |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, March 19—Agricultural Society of England.
THURSDAY, — 20—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, — 26—Agricultural Society of England.
THURSDAY, — 27—Agricultural Imp. Soc. of Ireland.

THE price of an article in the market depends upon the demand existing for it in relation to the quantity offered for sale. Where free competition exists among merchants and traders, and, so, a common understanding among the salesmen cannot be arrived at, then the price will in the long run be just the original cost of the article, *plus* such a profit as on the average satisfies those engaged in the traffic. It will not be more than this, because whoever might be disposed to demand a greater price, knows that he would be immediately undersold; it will not be less, because if the demand should cease, and prices fall below the standard of ordinary profits, the supplies would also cease, and the business be abandoned for others which still gave a reasonable return for the use of capital and industry.

Now even where a monopoly exists, the same terms may be used to express the circumstances of *price*. It is still the relation of demand and supply on which it depends: the only difference between this and the former case arises out of the fact that the salesmen can regulate the whole supply according to their notions of personal interest; and so the price is kept up to that pitch, not at which it can be profitably sold, but at which it can, with the lowest profit, be purchased. A certain number of farmers, for instance, purchase guano, and they find it so nearly a necessary of agriculture that they will pay 10l. a ton for it; that probably is the highest sum which can be given for it. If it were to rise beyond it, in all probability the purchases of guano would cease. We do not know what quantity may exist at present in England, or what is estimated to have been used last year; but probably to the extent of more than 120,000 tons a year, at nearly 10l. per ton, guano has been used by English farmers during the last five or six years. No doubt, the knowledge of its agricultural value has been extending all this time, and a larger number of purchasers than ever before are now willing to buy; but any advantage which holders of guano may derive from this, is certainly balanced by the losses which agriculturists generally have of late experienced in the prosecution of their business—many more may be willing, but far fewer are able; so that the price, 10l. per ton, at which the importers of guano maintain it, may be held to be now, as hitherto, the utmost which they could obtain.

The guano trade is now a monopoly. In 1845, out of 283,000 tons imported, only 14,000 were from the Peruvian coast; and then we had free trade in guano, and all the advantages to consumers of competition among the producers: but in 1848 and 1849, of the 155,000 tons imported in those two years, 138,000 were from the Peruvian coast; and Messrs. GIBBS, BRIGHT, and Co., may thus be said to have had the guano trade entirely in their own hands. The price of guano is what they fix upon for it, so long as they do not exceed the limit imposed by the necessities of farmers. We believe that they will find, during the ensuing year, that the prices they maintain are already beyond this limit.

The price of guano a few years ago may be said to have been the *natural* price, notwithstanding it was as high then as now. There was then undoubtedly a keener demand for it than there is now. The prices of agricultural produce then encouraged this demand, and so the price was kept at 10l. per ton in the face of the large importations of those years. The demand kept pace with the supply. But now farmers are not such keen purchasers: a smaller number will inquire for guano this spring than did so during the spring-time of 1849 and 1850. And if the prices of those years are to be kept up, the sales will probably be less extensive. Now, no man can say that the importation of guano into Great Britain has not largely benefited the agricultural interest, and through them the consumers of agricultural produce. And any diminution in the use of it would, in a similar proportion, be an injury done to both. But the benefit to be experienced from it hereafter, becomes very doubtful for the producers of beef and bread, if the manure is only to be had at the original price, while the manufactured articles, of which it is the raw material, have fallen 25 and even 40 per cent. in market value. We ask, then, whether it may not be the interest of the importers to reduce their prices so far as to extend the sale of an article which, were it in more extensive use, would more than anything else maintain the fortunes of their friends and customers—the farmers. Freights are not at present so high as they were, however onerous may be the terms of the contract with the Peruvian Government; and there is a strong opinion abroad that, under all circumstances, the price might be lowered, to the material advantage of both merchant and farmer. We suspect, too, that a reduction in the price of genuine guano would, more than anything else, check the infamous frauds of which the poorer class of buyers, unable to purchase it at its present price, are the yearly victims.

We would also express our belief that, if present prices are maintained, artificial guanos will become very much more influential competitors for public favour than hitherto they have been.

It is doubtless true that they are very inferior to Peruvian Guano ton for ton; but if they are sold at a proportionately low price, the difference in quality will be disregarded by all that large part of the agricultural community whose necessities leave them without choice.

## ON THE GROWTH OF BARLEY AND OTHER CROPS.

BARLEY is generally considered to succeed best on light soils, well pulverised and free from weeds, and is a crop which will stand dry weather better than any other: it is likewise reckoned the best for laying down with Clover and Grass, as in the Norfolk rotation: the best varieties cultivated, being in the counties of Essex, Norfolk, and Suffolk, in which great quantities are produced for the London market. On light soils Barley is, or should be, grown after sheep-fed Turnips, to consolidate the land by treading and manure. The ploughs should be brought into the Turnip field before the sheep are off, and a shallow ploughing given, as Turnip land is generally left much too long exposed to the weather to the waste of the good effects of the fold. In heavy clay soils, perhaps, a fallow may be necessary (where sheep cannot be admitted for fear of poaching the land on Turnips), as a preparation for Barley sowing.

The oldest rotation known, and which was almost universal in Europe from the time of the Romans, was the three field system; viz., fallow Wheat or Rye, sown in autumn, and Barley or Oats in spring. When properties were much intermixed, and subdivided, the whole of a considerable tract of land was divided into

three fields, so that it was impossible to deviate from the established course, especially as a right frequently existed of pasturing all the sheep of the parish on the fallow in summer, and on all others after harvest. In England this impediment was removed by the legislature passing Acts of Inclosure, but it is still felt in many parts of the Continent. Where a sufficient quantity of manure could be collected, by means of cattle fed on pastures and commons in summer, and in the straw-yard in winter, to give a regular dressing to the fallows every third year, good crops were produced, and the fertility kept up: the labour was very equally divided through the year; and such was the regularity of every operation, that a large quantity of land might be cultivated by the proprietor at a considerable distance, without a bailiff, provided he had honest servants. But when pastures came to be broken up, and converted into arable land, and cattle diminished, the land could not be manured on every fallow, the crops suffered, less straw being grown, the quantity of manure was diminished, and the land became less and less productive, till from necessity a portion was left uncultivated, and returned to natural and inferior pasture; this gave the idea of laying down land regularly to Grass, by sowing seeds; the apparent loss of a third part of the land by the fallows, introduced various crops, which were supposed to enrich the soil; of this kind one was Clover, introduced by the Flemish, and afterwards Turnips; by substituting them for an entire fallow, or rather sowing them early in the regular fallow, the Norfolk rotation was obtained. "In Flanders * the greatest care is paid to manuring and weeding; much more manual labour being bestowed than with us, and the crops seem more certain and abundant, in consequence; that it is not unprofitable, we may conclude from the wealth of the peasants, the comfort of the labourers, and the sleek appearance of the cattle. After ploughing into lands as we do, every intervening furrow is deepened and cleared with the spade, the earth being thrown over the bed sown; liquid manure (which is sadly thrown away in this country) is carefully collected and distributed over poor light soils, by means of water-carts, before sowing, and again when the crop is come up, which enable such lands to yield crops of Rape seed, Clover, Lucerne, and corn, equal in luxuriance to those on the richest soils. Fallows are rendered unnecessary by the careful destruction of weeds; in short, it is a garden culture on an extended scale. All the land is in tillage, except where rivers occasionally overflow, and render the meadows rich and profitable. The cattle are mostly kept in stables, and fed with green food, by which means one acre of Lucerne, or other artificial, will maintain five times as many beasts, as an acre of the best pasture; the great object is to increase manure, especially in a liquid state, to be preserved in tanks till wanted. This system is also followed in Switzerland, which, considering its soil and climate, is one of the best cultivated countries in Europe. In Holstein the following course is adopted:—1, Oats, on newly broken-up Grass-land; 2, fallow; 3, Wheat, manured; 4, Beans or Barley; 5, Wheat, manured, unless done for the Beans the year before; 6, Grass seeds, pastured for three years or more. In Mecklenburgh, a rotation not unlike the Scotch; 1, Beans or Potatoes, manured; 2, Wheat or Oats; 3, Barley; 4, Peas or Tares, manured; 5, Wheat; 6, White Clover, and seeds. Another: 1, Oats; 2, Beans, manured; 3, Wheat; 4, Tares, manured; 5, Barley; 6, Clover and seeds mown; 7 and 8 fed. Another on a rich soil: 1, Rape seed manured; 2, Wheat; 3, Beans or Potatoes, manured and hoed; 4, Barley; 5, Clover; 6, Wheat; 7, Oats sown down with white Clover. The end of this convertible system is to lay down the land in good heart, and as clear of weeds as possible; the Grass will then be abundant, and continue good for some years, and liquid manure carried on it in spring will so enrich it as to admit of making the crop into hay, or cutting it green for the cattle in the stables."

To resume the subject of Barley. Of all grains it is, perhaps, that which comes to perfection in the greatest variety of climates, and is found over most of the habitable world. It bears the heat and drought of tropical regions, and ripens in the short summers of those which verge on the torrid zone. In Egypt, Barbary, and the south of Spain, two crops of Barley may be reaped the same year. One in spring from seed sown the preceding autumn. This explains a passage in Exodus, ix. 31. "The Flax and the Barley were smitten, for the Barley was in the ear, and the Flax was bolled: but the Wheat and the Rye were not smitten, for they were not come up." This event would happen in March; the first crop of Barley was, therefore, nearly ripe, and the Flax ready to pull; but the Wheat and Rye sown in spring were not sufficiently forward to be injured by the plague of hail. Barley is distinguished by its species from the time of sowing it, and from the number of rows of grains in the ears, six rowed; four and two on flat Barley, which is most commonly cultivated in this country. Winter Barley is mostly sown in countries where the winters are mild, as the South of France, Italy, and Spain, and where the snow lies deep in winter, and where the sun is powerful after the melting of the snow in spring, as in parts of Russia, Poland, and North America, in some parts.

In moist climates, where the winter consists of alternate frost and thaws, and the early part of spring is usually wet, as in Great Britain, the young Barley is apt to suffer, and the spring sown Barley gives the most certain prospects of a good crop; but the grain of the latter is seldom so heavy as that which has stood the winter, and being harvested later, it interferes with the Wheat harvest.

In this neighbourhood the old school of farmers often grow their Barley on Wheat stubble, which, though not a plan to be commended, may answer in some cases, where a dry autumn allows the Wheat stubble to be ploughed and well cleaned and several ploughings and harrowings given; but in this case it is not advisable to sow Clover and Grass seeds on the Barley, or not till the Barley stubble is ploughed up. The quantity sown by the acre was formerly 4 or 5 bushels, but now from 2 to 3 are reckoned sufficient by advocates for thin sowing; but this must depend on the land and season. The time for sowing is of course likewise dependent on seasons, the middle of March, as soon as the land is dry, is the best rule; as in very early sowing, cold wet weather prevails, which is injurious to the young plant. The depth of depositing the seed should be about 1½ to 3 inches; after sowing, rolling is useful. In some seasons of wet, the Barley is rather choked up by Clover (when sown on it) particularly when sown late. According to Mr. Rham, in Flanders, Clover is hardly ever sown with Barley, but with Rye, and a kind of White Carrot, sown instead, in the sandy soils—these push out very little of the green top, but shoot their fibres downwards. After harvest, the land is well harrowed, and watered with liquid manure. The Carrots then sown, spring up, and a good crop is secured before winter. Barley is often raked together like hay, after harvest, but it should, as well as Oats, be tied up the same as Wheat. I conclude this article with a result of the analyzation of the ashes of burnt Barley and its straw, grown on a chalky soil (by M. Theodore de Saussure). The grain, reduced to ashes with its skin on, gave, out of 100 parts, 18 of ashes, which contained—

*H. E.*

* According to Rev. W. Rham—"Dictionary of the Farm."

## WHAT MAY BE DONE BY BETTER TILLAGE.

At present, when so much is written in favour of an extended application of manure, some good may be done by bringing in contrast instances of extraordinary fertility gained wholly by improved tillage. It was with this view I, a few weeks back, had something to say upon the farming of the Rev. J. Smith, who is growing 4 qrs. of Wheat per acre year after year, from the same land, at little cost, and without manure, simply by deep and clean cultivation; and it is to confirm what Mr. Smith has said, that I now allude to what Jethro Tull wrote 120 years ago in favour of finer tillage, as opposed to high manuring and ordinary cultivation; and as many of your readers may not have read his work, and it is difficult to procure, and its old style makes it troublesome to peruse, I will begin by stating that Jethro Tull, for many years, farmed several hundred acres, near Hungerford, in Berkshire, and we are indebted to him for the origin of the drill and horse-hoe, which he invented to enable him to clean, and to frequently move and finely pulverise the ground aside his growing crops. His farm was called Prosperous, and such was his success, year after year, in raising more than ordinary crops of Wheat without manure, that he fell into the error of believing land wanted no other assistance to grow grain than finer tillage; and well he might so err, seeing that his crops appear to have gone on improving, after having pursued this system for 16 years, and his returns were greater than his neighbours', notwithstanding that he left sufficient space between the ridges, on which he grew his corn, to admit of ploughing between them, and in this way half his land apparently lay idle; but Jethro Tull tells us that this uncovered space was not unoccupied, but was feeding the roots of the adjoining rows of corn, which permeated it in all directions, and he shows that in this way corn may be fed from distances of 4 feet.

It is singular that 120 years after this was written, we should find a gentleman and a clergyman, convinced by his arguments, adopting his practice, and after six years' trial testifying from his success, to the truth of all that Jethro Tull has stated, and yet that such valuable lessons should have made so little impression, but such is the fact; and one may have doubts, seeing the large assistance that land now receives, and the inability farmers profess to grow corn as cheap as other less civilised countries do, of the correctness of the course that has been taken to advance agriculture. One hundred years back we were exporting corn at a profit, and science has since done much to diminish the cost of cultivation, still we have the instance of Mr. Smith cultivating land with the spade and by hand labour, and growing grain at less cost than the farmer, aided as he is by his modern manures, improved ploughs and horses; and what is even more singular, we find Mr. Smith is doing this without the dressing which is considered so necessary by the modern school, that they make its production and collection the first consideration.

But enough of this. The value of "Trench ploughing and finer comminution of the soil," are subjects well worthy of a paper to themselves. To return to Jethro Tull; there is another experiment of his which is worthy of notice, as illustrating the importance of keeping land clean. He says, "Let three beds of the same soil, equal and equally prepared, be sown with the same sort of corn. Let the first be kept clean of weeds, in the second let a quantity of weeds grow with the corn, and in the third stick up a quantity of dead sticks greater in bulk than the weeds. It will be found that the produce of corn from the first will not exceed the third; but in the second, where the weeds grew, the corn will be diminished in proportion. The sticks having done no injury to the corn, show there was room enough in the bed for company to lodge, would they forbear to eat;" thus proving that the mischief done by weeds is by the abstraction of nutriment from the growing corn, and not by the occupation of space, and that the quantity of straws above-ground is governed by the amount of nutriment within reach of the roots; and in other parts of his work, he says, in the following year he found a considerable difference in the crop on the ground between what had been hoed the previous year and what had not, showing that the good effects of moving the soil between the young corn is not confined to one crop; and he brings other instances to show that land is benefited for years after by hoeing, and the disintegration from one year's good tillage; and although, from the want of modern chemical knowledge, he has not used the arguments which modern information would have afforded him, to prove that by frequent moving and fresh exposure of the soil between the rows of corn, he was, from the decomposition of the mineral matter, continually creating fresh supplies of fertility, and therefore some of his explanations are unsound. Still it is curious to observe how much the discoveries of Liebig and other chemists may now be brought to support the horse hoeing of Jethro Tull; and still more so the greater success of Mr. Smith, from deeper working of his land. They go far to prove, as Liebig teaches, that under ordinary cultivation, corn plants have more occasion for artificial supplies of inorganic than of organic matter—in other words, of the mineral constituents of soils, than of animal or vegetable matter; and that whilst air and moisture abundantly supply the elements of the latter, the disintegration of the soil is too slow in giving the former in a form suited for roots to take up. The practice of Jethro Tull and Mr. Smith confirm this; for whilst they gave no organic matter to the soil, they were, by their deep cultivation, fine division, frequent moving and exposure of the soil, greatly aiding its decomposition, and largely adding to the available amount of inorganic matter. I would suggest to agricultural chemists that they cannot render a more interesting service to farmers than to enlighten them upon the changes that soils undergo from aeration and the alternation of heat and cold, wet and drought, and the value of these changes in producing fertility. That soils are vastly improved by frequent exposure has been understood from the earliest times, but the constant dissolving of mineral matter going on from atmospheric action, and the fertility thence arising, is an open field for inquiry, and likely to yield much valuable information. In farming it would appear that we are far from looking sufficiently to this aid to corn growing, although in gardening the practice is much more conformable. The market gardens round London offer fine practical schools to young farmers. On land paying 8*l.* and 10*l.* an acre rent, Tull's wide intervals and inter-row cultivation has long been adopted, and the fertility gained by aerating the soil is highly appreciated, as is shown by their practice of trenching, and laying their land up to the weather, and of finely pulverising and continuously moving it; indeed I believe the best lessons on farming are to be gained in the humbler but generally more intelligent schools of gardening. *Hewitt Davis, 3, Frederick's-place, Old Jewry, March 7, 1851.*

## Home Correspondence.

*Cheap and Durable Paint.*—In reply to "M. B.'s" inquiry, p. 141, the most durable and effective paint I am acquainted with is the iron paint of the patent alkali company, which stands all weathers, upon wood, iron, slate, or brick, when used with linseed oil, and the surfaces properly dry. It is also one of the cheapest linseed-oil paints, and covers a much greater breadth than white-lead. The colour is not pleasant, being a deep chocolate or purple-red; but this can be obviated by a mixture of white or other light colour, with the last coat. The coal-tar paints, which are less costly, neither lie so even, nor last nearly so long, so far as my experience goes. I do not think it is generally known in the country, but the London agent is, Mr. J. West, 1, New Broad-street. *J. Prideaux.*——"M. B." wishes to know what paint to use on his new buildings. I have much pleasure in being able to recommend C. D. Young and Co.'s patent metallic paint; the price is 5*d.* per lb., and it can be laid on by any farm labourer as well as a painter. I have used a great deal about my farm, and it is by far the best and most durable paint that I have met with; it can be obtained at 22, Parliament-street, Westminster; or 1, Castle-buildings, Derby-square, Liverpool; with oil, turpentine, brushes, &c. *T., Warrington.*

*The Drainage Act.*—The various communications which have appeared from time to time in your columns respecting the Drainage Act and its operations, have afforded me a little information and a good deal of amusement. It is really quite laughable to see how anxious certain gentlemen are to make a handsome income out of the money advanced for the benefit of suffering agriculturists. Of course, they do not give this as their motive. Oh no! it is all for the good of the nation. There has been some allusion to the

expenses incurred in putting the Act in force in different localities, and names have been used with more freedom than discretion. It has been my lot to have to arrange for drainage under the Act with two inspectors on different estates; and I have had no reason to complain about charges or of any desire to force any system of drainage at variance with my own experience. I know, however, that such judicious conduct is not always pursued; take the following as an instance:—Application for a loan under the Act was made in the proper quarter, an inspection was made, and the loan granted. Thus far all was smooth enough, but when the inspector presented his account, judge of the surprise it created when it was found to amount to 120*l.* or 130*l.*, I do not remember which. The commissioners were referred to, and their remark on the charge was quaint and pithy—"It is monstrous." If there have been many similar charges for "inspections," can it be wondered at if proprietors hesitate before they venture to incur them? I think it might be useful if the commissioners were to lay down a few stringent rules for the guidance of their subordinates in the matter of charges; that these latter gentleman want bringing into subjection to their superiors, the recent letters in the *Agricultural Gazette* abundantly show. *Roaldus.*

*Thin Seeding.*—I should like to ask "J. H." two questions—How much land he holds? and how much he sows per acre? for though he puts his rows 2 and 3½ feet apart, perhaps he puts the grain very thick in the rows. Your correspondent says he grows seven quarters of Barley per acre in rows 3½ feet apart; and after 28 years' practice, he finds 2 feet the right distance for grain crops. I thought I was as near as possible of getting hold of the philosopher's-stone, if I had not got it, in reference both to quantity and distance, viz., the rows between 11 and 12 inches apart, and the quantity according to the quality of the land, say good land *one* peck, middling land *two* pecks, and bad land *three* pecks per acre. It seems strange that so many millions of farmers should have been trying their skill in the art of sowing for so many thousands of years, and cannot as yet decide upon a verdict as to the quantity to be sown per acre. If by sowing one bushel less we could grow more corn it would be a greater benefit to the nation than the abolition of all the taxes the public are now seeking. *J. D. Piper, Celne Engaine.*

*Winnowing Machines.*—We have now got various sorts of winnowing machines, which would appear capable of dressing the corn far better than it could have been done formerly with the same labour. But it often occurs that the work is not done in such a manner as we might be led to expect. And there are various reasons given for this. If the maker is told that the implement does not make a good sample, he at once lays the blame on those who have the working of it. It has not been put in proper order for the work. And to provide against this many have printed directions to accompany their machines, which state how everything is to be set. And one would think that they should know well enough how it is to be put. But after all their rules are attended to, we find that the work is in many cases but indifferent. There is one defect that I think applies to some of our best machines, that is, that they are too wide, that the fan is too long in proportion to the machine from head to tail; and the consequence is that the air has not time to rush in for supplying the fan equally from outside to centre, and the consequence is that the currents of air go in a diagonal direction towards the riddle, until they meet, and coming together obliquely their force must be considerably broken, and their course altered, so that the wind may be strong enough to drive corn before it at one part, and so weak that the chaff is left at another. I have seen an old narrow machine perform her work far better than some of our modern highly finished ones, and I have generally noticed that the narrower ones do it best. I believe that if the length is proportioned to the width, this defect will be got over; but then they will require greater power of motion; and perhaps without a corresponding speed. And I do not consider that they would be so convenient for general purposes as if of moderate size, however they may do for being attached to a threshing machine, as in that case they would not have to be moved about. It would be well if our makers, in their anxiety to produce a perfect article, would not overlook this, for we have them now in many respects very efficient, especially in the mechanical parts of riddling and sifting, but too often deficient in the winnowing part. *G. S.*

*Management of Manure.*—On looking over the *Chronicle* of the 18th of January last, I perceived a report of a meeting which took place at Exminster, to hear a lecture from Dr. Bucknill, on the most economical method of using manure; and on reading over that able, eloquent, and admirable address, which every farmer and gardener ought to make their study, I was struck with that part where he speaks of the rain which falls on the sheds being allowed to run into the dung-pits to wash away anything that is soluble in them into the next ditch; and on giving this part of the address all the consideration possible for me to do, I said if this happens in favoured England, what can be expected of this fertile, beautiful, but neglected country, Ireland, where there is rarely any encouragement given to the farmer to be zealous, or to the labourer to be industrious: and yet even here I have occasionally seen all the methods recommended by Dr. Bucknill, for saving manure, well carried out and clearly understood; but certainly I must allow the instances were not as frequent as could be wished. I was led to make the above remarks by observing, that among the many means advised by the learned doctor for saving the urine of cattle, there is one not spoken of which I have carried out for the last three years with very great advantage, and as it is one which is very economising of labour and manure, I will, with your permission, here mention it. I make it a practice, during the spring and summer months, to get the parings of ditches, and any other spare earth or mould to be had on the farm, carted into a heap, as near as possible to the cow-sheds, and made up so as to turn off the rain; and when the cows are bedding down I have a quantity of the same strewn immediately behind the cows, which effectually soaks up every drop of urine that comes from them. In the cleaning out of the sheds this becomes mixed up with the solid manure, and occasionally there is a layer of about 6 inches of the dry earth spread over all; and I have found by this means my manure heaps to accumulate amazingly, and to be greatly improved in texture; and there is seldom any of that coloured matter, which is well known to be the farmer's best friend, to be seen oozing from the sides of a heap made up after the above manner, although I have had them 8 feet high; but then we have gutters to our sheds, and they are not allowed to run into our dung-pits. *E. M. C.*

*Agricultural Improvement.*—It is a common opinion with practical farmers that large farms and numerous ploughs and horses are requisite to enable the farmer to farm profitably. Though in some situations, as on thinly populated tracts of shallow wold land, this may be correct; it will probably be found to be a very erroneous opinion in other cases. In many situations, where the population is great, and labour plentiful and reasonable, it may be far more profitable to cultivate smaller farms, in a more perfect garden-like style, with fewer horses and more manual labour. The spade and the fork have sometimes been advantageously substituted for the plough and the harrows, and that might be the case much more frequently on small, and sometimes on large farms. Thus cultivated, 50 acres will frequently produce as much as 100 or 150, in the common way of cultivation. If this be true, and we have abundant evidence of its truthfulness in allotment ground, it is evident there is a great waste of land, of horse keep, and of unemployed manual labour, which might be advantageously employed, even on poor soils. It is evident, too, that by labour and science, some of our very poor land may be profitably cultivated, even though the price of produce should be low. Since writing the above, I have been much gratified by reading Mr. Mechi's account of Lord Fortescue's farm of 52 acres, published in the *Agricultural Gazette* of the 8th Feb. It greatly confirms my opinions, and illustrates practices which might be advantageously adopted in other places. The public owe a debt of gratitude to Mr. Mechi for his spirited efforts to improve agriculture by new plans. He may be enthusiastic and run into errors. And if he be at times a little severe in censuring our bad old practices, and if he urge us old farmers on at a quicker pace than we are willing to go, it is all for our good; it is a little good tempered raillery which we really need. Let us not then take offence where none is intended; let us rather pity than retaliate; for though he, and such men as he, are public benefactors, I fear, they are too experimental and enterprising, and too fond of trying untried schemes to profit themselves; but the public is greatly benefited by their experiments, and it is our own fault if we do not profit by them. It is evident that there is very great need of new and improved plans to bring agricultural improvement up to the improvement made in other arts and sciences. The most perfect cultivation that can be found comes very far short of the degree of perfection which may be attained; and every effort towards it should be encouraged. If landlords and land-agents would give all the encouragement to agricultural improvement which it is their duty and interest to do, tenants would soon become far more energetic, intelligent, and enterprising than they now are. Let those landlords and agents who complain of bad tenants, consider whether they have done their own part in encouraging good ones. I am glad to find that many landlords and agents are now endeavouring to do their part in encouraging improvement; but this is a new thing, and as yet there has not been time to cultivate those qualifications in tenants which such proceedings will after a while produce. Let every man do his duty, and agriculture will rise from its present state of depression, to a degree of perfection hitherto unknown. *O. F.*

*Mr. Pusey and Scotch Farming.*—The Scotchmen are justly roused by the speech of this gentleman at the meeting of the London Farmers' Club. I believe the English are more to blame for commending the farming of the north than the inhabitants themselves. And why? Does Mr. Pusey know that many sons of English landlords have visited Scotland these 20 years past solely to study agriculture in that country? And who can deny the Scotch the merit of farming well, especially in the counties of Berwick and Roxburgh, and we will add the Lothians, and the neighbourhood of Coldstream. Mr. Pusey, in his travels, went away from such places as had any repute for farming. He did not see them, save afar off, if at all. In England we have many advantages as to climate. Soil, situation, and climate, form the natural basis of good farming; and this is not at the command of every one. We can soil our horses upon Tares a month to six weeks earlier than they can in Scotland. Wheat can be grown with greater advantage by us in the south, but who can surpass them in the growth of roots, Barley, Oats, Beans, &c. Their Clover crops are magnificent. And in ploughing, hoeing, weeding, &c., who can surpass them? In draining also, who value the necessity of it more than our old friends north of Tweed? *X. Y. Z., Hants.*

*Poultry.*—Perhaps you will permit me to state my own mode of managing a small stock. Mine is a small family, and we wish to have both chickens and eggs; for the former purpose I have a Cochin China cock and five hens, and for the latter, the same number of Spanish; and they are thus assorted—the Spanish cock, one Spanish and four Cochin China hens; so also the Cochin China with one of his own and four Spanish hens. The object of this arrangement is to have a sufficient number of pure bred birds for breeding stock, and all the other chickens for table to be half-bred; as I consider the first cross an improvement on either breed for that purpose, but the next cross would degenerate. I take care that all the half-bred are killed off before breeding, as if allowed to continue they would soon spoil the stock. The eggs of the China and Spanish are so different, that there is no danger of any mistake between them. I find this plan to answer very well, and perhaps some of your readers, who rear poultry on a small scale, may be inclined to try it. It is of great importance in keeping up a pure stock, that all the breeding fowls should be thorough-bred, which is easily provided for by this means. May I add, that for table, there is no poultry so well tasted as the Sebright bantam. *T.*

*Rabbits on open-boarded floors.*—My groom having a great fancy for rabbits, was often unfortunate with them, by heating, rotting, &c. Envying my success with young animals on boards, he begged to have a place similarly constructed; and the result for six months has been perfect health amongst the rabbits, which afford every week some fine specimens for the table; and so successful is the operation and increase that we shall be obliged to market some. The boards have intervals of 1 inch, being 3 inches wide. The rabbits are fed on Swedes, or green food, Oats, and cut hay. The warmth is regulated by putting up boards in front of their sheds. I should not have thought of troubling you with this matter, but that so many of my visitors are struck with the advantage and economy of these open-boarded floors for rabbits. It is quite certain for all animals they possess immense advantages in a sanitary and economical point of view. Where I have a few young pigs on straw, I have always cause to regret it, so I must extend my operations. They will be found most convenient for ducks. *J. J. Mechi, Feb* 26.

## Societies.

### ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held at the Society's House in Hanover-square, on Wednesday last, the 12th of March: present, Sir Robert Price, Bart., M.P., in the chair, Baron Mertens, Sir Thomas Dyke Acland, Bart., M.P., Mr. Bastard, Mr. Bosanquet, Mr. Beale Browne, Dr. Calvert, Mr. W. G. Cavendish, M.P., Mr. Dyer, Mr. Fuller, M.P., Mr. Gadesden, Mr. Garrett, Mr. Fisher Hobbs, Mr. Maddison, Mr. Majendie, Mr. C. E. Overman, Mr. Pendarves, M.P., Mr. Rowlandson, Professor Simonds, Mr. Aug. Smith, and Professor Way.

The following new members were elected:

De Grey, the Earl, Wrest House, near Bedford.
Marshall, George Hibbert, 85, Eaton-square, London.
Smith, Henry, New House, Sutton, Shiffnall, Salop.
Verrall, Richard Relfe, New Hall, Henfield, Sussex.
Soames, Daniel W., Pinner, Middlesex.
Briggs, John Atkinson, Bessell's Green, Chevening, Kent.
Page, Thomas, 2, New Scotland-yard, Whitehall.
Towgood, Edward, St Neot's, Huntingdonshire.
Boughton, Andrew K. Rouse, Acton Hall, Salop.

Country Meeting of 1851.—The Duke of Richmond forwarded to the Council a letter addressed to him, as President of the Society, by the Mayor of Kingston-on-Thames, offering to the Society, in the most handsome manner, on the part of the Corporation of that ancient and royal borough, the free use of their Guildhall, Assize Courts, and other public rooms, for the use of the Society during the period of the ensuing country meeting to be held in Bushy Park, "hoping that the Council of the Society would do the Corporation the honour of accepting the offer." This communication was received with the best acknowledgments of the Council, and referred to their next monthly meeting.

A deputation from Windsor, consisting of the Right Hon. John Hatchell, M.P., Attorney-General for Ireland, Colonel Reid, M.P., Mr. Leslie Melville, and Mr. Darvill, was then announced, requesting an interview with the Council, for the purpose of endeavouring to induce the Society to hold its Country Meeting, not in Bushy Park, but in the Home Park at Windsor, in the immediate vicinity of the Castle walls, where superior advantages of every kind would, in the opinion of the deputation, be found for the arrangements of the meeting itself, and the more distinguished promotion of the truly national and patriotic objects of the Society.—The Council expressed their regret that the circumstance of their being then only in weekly session, when by the bye-laws their proceedings were connected only with discussions on points of practical farming, without the power of legislative functions, would not allow them to receive the deputation which had on that occasion honoured the Council by their attendance. Sir Robert Price and Sir Thomas Acland then saw the deputation privately in the library of the Society, and explained to them the nature and extent of the arrangements already made for holding the Country Meeting of the Society at Hampton Court, and the show of live stock in Bushy

Park, on a site of ground within the Royal domain, most graciously accorded by her Majesty for the use of the Society for that purpose. They also stated to the deputation, that the Monthly Council could receive any statement on the subject, which however the Weekly Council had not the power to do; they would, however, report the occasion of their mission to the Duke of Richmond, who had the power, as President of the Society, to call a special Council at his pleasure.

FLAX.—Mr. ROWLANDSON, a member of the Society, well knownto its members by his numerous Prize-Essays in their Journal, favoured the Council with the following communication :—

March 10, 1851.

IN order to contribute my mite of information respecting the Flax crop, I forward this communication ; prior, however, to giving any recommendation which my experience may suggest for the future guidance of the agricultural body generally on this important subject, I wish to say a few words respecting a matter which has of late created much noise, viz , the influence which certain alleged discoveries respecting the conversion of ordinary Flax into Flax Cotton may exercise upon the growth of this crop.

The conversion of fine Flax into cotton is about as sensible as though it were proposed to transmute gold into silver or silver into copper. The difference in cost between articles manufactured from cotton or Flax, does not so much exist in the cost of the raw material as in the more expensive manufacture of one over the other, particularly in the bleaching process ; cotton fabrics can be bleached rapidly and, comparatively speaking, inexpensively, whilst the finer kinds of linen can only be what is termed Grass bleached. If Flax fabrics could be as inexpensively bleached as cotton cnes, the lower price of the raw material of the former would fully compensate for the more expensive spinning process. The following comparative tables of the commercial values of the raw material will show this :

| COTTON. | | | |
|---|---|---|---|
| Surats, 4*d.* per lb. or ... ... | ...£37 | 6*s.* | 8*d.* per ton. |
| Uplands, 6*d.* per lb., or ... | ... 56 | 0 | 0 ,, |
| Sea Islands, 1*s.* per lb , or ... | ... 112 | 0 | 0 ,, |
| Ditto, to 1*s.* 8*d.* per lb., or ... | ... 186 | 13 | 0 ,, |
| JUTE,* HEMP, AND FLAX. | | | |
| Jute, 3*d.* per lb., or ... ... | ...£28 | 0*s.* | 0*d.* per ton. |
| Hemp, 3½*d* per lb , or... ... | ... 32 | 13 | 0 ,, |
| Common Flax, 4½*d.* per lb., or | ... 42 | 0 | 0 ,, |
| Middling Flax, 6*d.* per lb., or | ... 56 | 0 | 0 ,, |
| Fine Flax, 9*d.* per lb., or ... | ... 84 | 0 | 0 ,, |
| Extra fine ditto, 1*s.* per lb., or | ... 112 | 0 | 0 ,, |
| Super extra ditto ... ... | 120 to 150 | 0 | 0 ,, |

It may be laid down as an axiom that it will not pay the British farmer to grow Flax of a quality when dressed worth less than 6*d.* per lb., or 7*s.* per stone of 14 lbs., which at 60 stones per acre would produce 21*l.* This quantity, however, is much more than is usually obtained. A crop of 40 stones of fine Flax, at 9*d.*, would, however, return the same amount of money at less cost in manipulation, less exhausting to the land, and consequently less expensive in the cost of manure, and requiring only an inferior soil for its growth, whilst on the other hand an extraordinary heavy crop on very fertile land, highly manured, could not be expected to yield more than 80 stones per acre, worth only 4½*d.* per pound or 5*s.* 3*d.* per stone, or 21*l.* per acre ; such a crop would be very distressing to the land. Now there is not the slightest prospect of the recently propounded discoveries converting such a coarse Flax as last described, from one worth 4½*d.* per lb. into one worth 6*d.*, in fact the process can only convert fine Flax into a textile capable of making a coarse fabric ; if the process can be applied at all, it can only be profitably done with Jute and Hemp, neither of which can be advantageously grown in England. It is a very erroneous opinion that Flax requires either rich land or high manuring, light lands in fair condition are the soils most suitable ; in England the green sands are *par excellence* Flax soils, but Flax may be grown profitably on the Bagshot Sands. The finest crop of Flax for quality of fibre which I ever saw grown was some sown on poor gravelly moor incumbent on the gritty or conglomerate lower beds of the old red sandstone in Ireland. I see no good reason why this crop might not be cultivated on the thinnest chalk soils, and certainly is well adapted for growth on the red soils which form so large a portion of the Downs of the South of England. For clays and stiff lands generally Flax is wholly unsuitable. The best Flax is grown upon freshly broken-up lea ; as, however, it will be almost too late to prepare lea this year, it may be stated that any light land in good heart may be safely sown with Flax from the present time to the 10th of April, premising that the land should be harrowed very fine previous to sowing.

Riga seed should always be sown at the rate of from 10 to 14 pecks of seed per acre, 10 pecks only if intended to stand for seed ; on weak land the Flax should be sown thicker than on strong land, *very fine Flax* should not grow above 18 inches high, at which height, under favourable circumstances, from 45 to 50 stones per acre will be obtained. American seed is the best of the seed crop, and is most sought by the farmer.

The best course for new Flax growers to pursue is to grow a small quantity on land of medium quality, but on which no labour has been spared to get it into a fine tilth ; seed as above, and pull it for the white or virgin Flax, as it is sometimes called, that is, as soon as the most forward of the seed bolls are fully formed—if a wet season, a little later, if a dry one, a little earlier. Another advantage derivable from pulling the Flax for white, is, that it can be off the ground, and a crop of Turnips be safely sown by the middle of July ; by this means the new Flax grower can scarcely suffer any loss by his experiment, whilst to the old grower the crop of Turnips will compensate for a crop of seed. On favourable soils, such as the green sand, Flax and Carrots might be sown as in Belgium. Weeding must be carefully attended to until the Flax has overgrown them.

The process of retting is the one most difficult for the farmer to learn, it will therefore be better for the novice at Flax growing to dew ret and pull for the white. Dew retting is accomplished by laying the Flax on Grass-land exposed to the rains and dew, often for a period of four or five weeks ; this forms a good top-dressing to Grass-land. It is by no means desirable that any process should be discovered that would take away the retting and preparatory processes from the hands of the farmer ; if such is the case, Flax must inevitably become to some extent an exhausting crop, and will also deprive farm-labourers of a source of employment at the most pinching season of winter.

I may conclude this letter by stating, that it is a complete mistake to suppose that our manufacturers are at any inconvenience for a supply of coarse Flax, this can always be obtained from countries where labour and land is cheaper than that employed by the British farmer, and if any invention was discovered to increase that demand, those countries would always amply supply it, and beat the British farmer out of the field ; what is really wanted by the manufacturer, and of which there is an increasing demand, is fine Flax, the deficient supply of which has tasked the ingenuity of our manufacturers to the utmost, in order to make a coarse fibre into a fine fabric.

To those having an opportunity, the following experiment might be made, say on a three acre field ; two acres sown with Flax, one acre with Barley, the whole seeded with Clover, one acre of Flax to be pulled for white or virgin Flax, and dew retted, the other acre to stand for seed ; this would show a fair comparison of the relative advantages and disadvantages of sowing Flax in the place of Barley, after Turnips. On light Turnip lands, I have great confidence of the success of such an experiment. (Signed) THOMAS ROWLANDSON.

* Jute is a coarse kind of hemp from the East Indies.

Mr. FULLER, M P., then laid before the Council the following balance-sheet of his trial of Flax-cultivation on one acre of land :—

| EXPENSES OF CULTIVATION. | £. | *s.* | *d.* |
|---|---|---|---|
| Rent... ... ... | 0 | 12 | 0 |
| Taxes ... ... | 0 | 4 | 0 |
| Ploughing ... ... | 0 | 8 | 0 |
| Sowing and harrowing ... ... | 0 | 6 | 0 |
| Weeding ... ... | 0 | 3 | 0 |
| Pulling ... ... | 0 | 14 | 0 |
| Carting to barn ... | 0 | 2 | 0 |
| 2 bushels of seed, at 10*s.* ... ... | 1 | 0 | 0 |
| Threshing ... ... | 1 | 0 | 0 |
| Cleaning ... ... | 0 | 2 | 0 |
| Balance in favour of cultivation... ... | 8 | 6 | 0 |
| | £12 | 17 | 0 |

| PROCEEDS OF SALE. | £. | *s.* | *d.* |
|---|---|---|---|
| 24 bushels of seed, at 8*s.* ... ... .. | 9 | 12 | 0 |
| Straw ... ... | 3 | 0 | 0 |
| Chaff ... ... | 0 | 5 | 0 |
| | £12 | 17 | 0 |

The field on which this Flax was grown, after Oats, at Rose Hill, in Sussex, in 1849, contained 9 acres, namely, 1 acre Flax, 1 acre Mangold, 6 acres Swedes. The Flax was manured in the April of that year, with 2½ cwt. of guano, the Mangold and Swedes receiving 25 loads of farm-yard manure. In October, the whole field was sown with Australian White Wheat, and the crop was quite as good on the acre where the Flax had been grown as on the other part of the field where the root crops had been grown.

The Hon. R. H. CLIVE, M.P., presented to the Council a sample of Flax grown, and afterwards prepared, by himself. He had for the last 5 years grown about 2 acres of this crop, the produce of the seed, employed by him for feeding his stock, having varied from 16 to 24 bushels.

Mr. DONLAN addressed a letter to the Council, stating that a complete set of the machinery, alluded to by him on a former occasion, and intended to enable farmers to bring their Flax crops into a condition for ready sale in British markets, was at that time open to the inspection of the members, at his temporary premises, at the Canal Basin, Warwick-road, Kensington. Mr. Garrett kindly undertook to inspect this machinery, and report upon it to the Council at their next meeting.

Mr. EDWARD DAVY, of Crediton, also addressed a letter to the Council, informing them, that having read M. Claussen's specifications of patent, he found nothing whatever in them that interfered with the plans he had matured, previously to that gentleman's coming forward with his new processes for an altered and simple mode of preparing Flax, to render it cheaper, more gnerally useful, and an advantageous substitute, to a considerable extent, for foreign cotton. He hoped soon to be in a position to lay before the Society drawings or models of his machinery for the use of farmers, with full particulars of cost of erection and working, quantity of Flax prepared per day, and other details ; in the meantime, his machinery was about to be tried by an intelligent tenant-farmer, on 60 tons of Flax straw on his hands, in the state in which it was pulled from the ground. He hoped to succeed in preparing the Flax suitably, and finding for the farmer a market for it, at a remunerating price ; as he had already, he stated, produced Flax in a state pronounced, by an eminent cotton-spinnner, to be capable of being spun precisely in the same way, and with the same facility as cotton.

Mr. HILL DICKSON also favoured the Council with numerous details connected with his own experience in the cultivation and management of Flax.

The Secretary then called the attention of the Council to the spirited manner in which the Royal Agricultural Improvement Society of Ireland, as it appeared by a report of their proceedings, then laid on the table, were endeavouring, by their premiums and arrangements, to promote inquiry connected with the practical management of Flax; and to the following remarks made by the Editor of the *Irish Farmers' Gazette* in reference to the ensuing Dublin meeting of that Society :—

We look forward to the meeting, therefore, which will be held early in the month of August, with the greatest interest. It will take place at a time when the vast crowd of strangers that will visit London during the spring and summer months will be breaking up, and spreading themselves like a great swarm over all parts of the country ; and we have no doubt, from the central position of this city, and the great facilities of transit to and from, both by steamers and railroads, that it will be found the most eligible spot by far. Exclusive of the large amount of prizes given for the encouragement of stock, the Council have most wisely increased the premiums for machinery and implements of every description, and have allocated a large sum towards investigating the different processes of preparing Flax, which occupy public attention so much at the present. We look forward, therefore, to this meeting as the most fortuitous that could possibly occur for testing the merits of the different rival plans, and deciding impartially between them ; and we hope to have a regular field day between the respective projects known as Schenck's, and Claussen's, and Donlan's, besides several others, on which public opinion is so much divided at present. We shall return to the subject, and in the meantime, we lose no time in calling the attention of all our readers to the time and place for this important meeting, and in impressing on them the necessity of making every preparation for rendering it as effective and as truly national as possible.

An interesting discussion on the use of common salt as a manure for land and crops, and as an adjunct to the food of stock, then took place. In order to give this discussion at length, we reserve the report of it for our next publication.

Dr. Calvert's paper on the direct disposal of agricultural produce from the farmer to the consumer, without the intervention of middlemen, was, at his request, referred to the Journal Committee.

SELBY, *Jan.* 15.—The annual exhibition of stock and poultry, the ploughing matches, and the dinner in connection with the above Society, took place at Selby, and were attended with, if anything, more than wonted success. Lord BEAUMONT presided, and at the dinner proposed the toast of the evening, viz., "Success to the Selby Agricultural Society." He said—There have been lately in the *Times* some rather well-written and clever letters as to the state of agriculture throughout England. As to his observations generally, I must say that I cannot refrain from agreeing with him. So far as I know from recent observation, I think that his description is, in the main, perfectly true ; and there is one particular to which he alludes, and with which I completely agree, viz., that in some districts there is a vast difference between one farm and another, though there may be a similarity of soil. He says truly that in one case the farming is good and in the other bad ; and then he goes on to show that a good farmer, in bad times, is making as much or more profit than the bad farmer was making in good times. The inference is that the bad farmer must "go to the wall ;" there is no chance for him under any circumstances. I think it is shown in these letters, and that the experience of everybody who has paid attention to the circumstances will show the truth of this proposition, viz., that bad farming at the present day has no chance of struggling with the difficulties of the times. It is vain to say merely that landlords must come down with their rents. I feel that I am occupying a peculiar position. I know that I am speaking to those who are tenant-farmers, and I myself am speaking as a landlord. Very well, then, I say, although the observation may not be agreeable to all, that it is absurd to say "the landlord must come down in his rent, and then all will be right." No ; I say you will not get me to do that. But I also say this, viz., that if my farms are let beyond a fair valuation, taking the existing and probable value of corn, I'll have a readjustment. But I will make no return. And, moreover, I will say this, for it is only fair, although I am sorry to say there is cause for it, that if I find I have a farm which, with proper treatment, can pay a fair rent, and the farmer who is upon it does not choose to exert himself up to that point, I shall be ready to give such tenant notice to quit. Now I say that this is speaking plainly. If I were a tenant I should never be alarmed about rent. The rent of land will always adjust itself—the rent of land is always what you can get for it. (Cries of "No, no.") You misunderstand me. I mean to say that you can't get an unfair price for land, because if you do your land gets ruined. I repeat, then, that the land will adjust itself. I know it as the trustee of some property, and also as the holder of other property. A fair and honest tenant will always give what is a just and fair rent, and rent will always adjust itself. If you attempt to overlet your lands, you cut your own throats. (Applause.) If you do so you will not get the right kind of men. There are plenty of men who will scramble at land, but who know nothing of farming, and have no capital. Such men are always ready to bid beyond the market price. But the man who bids the market price is a good farmer. If you do not take him some one else will. He is known to be a good farmer, and every landlord wants to get such a man, and his terms are the fair market price. (Applause.) If a landlord seeks more than that, he will easily find a person to bid more, but when the rent-day comes such a tenant is in arrear, to a dead certainty. The land is neglected, and then what is the case ? Why, the land is in such a state that you are glad to get rid of such a tenant at any rate. You can hardly get a decent man to take it, and for the first year or two God knows what allowances you are obliged to make. This is exactly the position landlords are in. Therefore I say, under all circumstances, rent will adjust itself ; and if the landlord looks to his own interest, as well as to that of the tenant, he will always find that at last he must come to a fair market price. I can give you a very practical instance. When land was valued a certain time ago—certainly when corn was higher—say 7*s.* a bushel, the valuations ruled much higher than that. Now here is a case for re-adjustment. At present the tenant is not likely to get such a price. Therefore, the standard of valuation at that time will not apply to the time present, and I say that the landlord, in such cases, must now come to a re-adjustment. I won't talk of an absurd return of so much, and then you, the tenant, must come up again. No ; I say here is a permanent abatement, and likely to be ; and then we shall not see that nonsense in the newspapers that my lord this or Mr. that has returned so much per cent. out of his rent. (Laughter and applause ) It is a matter of fair barter and bargain. The tenant comes with his capital to convert that capital into profit, by employing it in the land. The first instrument, then, that the farmer wants, is the land. He therefore hires the land just in the same way as in any other trade he would hire the necessary machinery or buildings, or any other matter which is necessary for his profession. He hires it, and it is a mere question of barter between us. (Applause.) There are other relations, I must own, after this, of the most agreeable sort, which arise between the landlord and tenant, and those relations are likely to be better maintained, if there be a fair adjustment of rent, in the first place, and no returns and no boasting in the newspapers afterwards that you have given such returns. This would be much better, for then would be strengthened all those connecting links to which I look with great pleasure, as existing between landlord and tenant. (Applause.) I think that one of the chief pleasures of

such a connection is that of seeing another person profiting and enjoying himself in one's own neighbourhood, or upon one's own property; and also of witnessing those reciprocal attentions which make society agreeable. This is one reason why I should say that of all kinds of property, land is the most enjoyable, because it puts you in a position of being upon good terms with those around you—it affords you the opportunity of doing much good—and also imparts to you the pleasure of receiving a great deal of kindness and attention in return. (Hear, hear.) I quite agree that "property has its duties as well as its rights;" but whilst I endeavour to do my duty, of course I expect that no one will seek to infringe upon my rights. (Applause.) Wishing the greatest success to this institution, I beg to propose "Prosperity to the Selby Agricultural Society."

## Reviews.

*Domestic Fowl and Ornamental Poultry; their Natural History, Origin, and Treatment in Health and Disease.* By H. D. Richardson. A new edition. Much enlarged. London: Wm. S. Orr and Co. (No date.) Pp. 160.

We were glad to hear of a fresh publication of Richardson's "Domestic Fowl." He really seems to have been an amiable man, whose unfortunate destiny it was to take to authorship. His widow and children were left but scantily provided for by the profits of his various hastily-written little treatises. The pamphlet under present consideration at one time appeared to be threatened with "assimilation," after the boa-constrictor fashion, by Mr. Nolan, as a matter of right; Richardson was dead, and Nolan appeared likely to be his Buddha,—absorbing him, body and soul; for he summed up his own and his predecessor's comparative merits in the following modest terms:—"In conclusion I beg to say, it is now nearly half a century since the appearance of the first edition of Mowbray, on Domestic Fowl, and although since that time several new varieties have been introduced, they have been, until a very late period, totally unnoticed—each succeeding book being merely a servile copy of its predecessor, and some professing originality with less than moderate acquaintance with the subject—until Richardson (*an easy writer, whom I induced to commence the subject*, and furnished with materials, and my birds to have drawings and engravings made,) no one treated of the new varieties, and even the old ones were imperfectly described; but Mr. Richardson, not being a practical man, in the way of fowl, has fallen into many errors, when attempting to describe, without the assistance of others; to remedy which I have been induced to lay, in the foregoing pages, my practical experience before an enlightened and discerning public, and hope for their indulgence." (P. 191.)

We therefore expected to see no more editions of "Domestic Fowl;" but a new editor has taken it in hand, and rescued it from oblivion, bringing to his task no little literary skill, as our readers will perceive from its opening paragraph:—

"Poultry-keeping is an amusement in which all classes can and do indulge. The space needed is not great; the cost of food for a few head insignificant, and the luxury of fresh eggs or home-fatted chickens and ducks not to be despised. In a large collection of poultry may be read the geography and progress of the world. The peacock represents India; the golden pheasant, and a tribe of ducks, China; the turkey, pride of our yard and our table, is one of our many debts [which we do not repudiate], to America; the black swan, rival of the snowy monarch of our lakes, reminds us of our Australian discoveries; while Canada and Egypt have each their goose. The large fat white ducks—models of what a duck should be—are triumphs of British breeding, affording a specimen of one of the best productions of Buckinghamshire since John Hampden; while the shining green-black ones at once fly away with us to Buenos Ayres and Dictator Rosas. And when we turn to the fowl varieties, Spain and Hamburgh, Poland and Cochin China, Friesland and Bantam, Java and Negroland, beside our native Surrey, Sussex, Kent, Suffolk, and Lancashire, have each a cock to crow for them."

The most important feature in this reprint, in the eyes of practical amateurs and dealers at least, will be the reformation of the nomenclature, and the rectifying of the former confusion respecting Hamburgh and Polish fowls. Now, the fowls with top-knots are united under the title of Polish, and that of Hamburgh only applied to those with rose combs. The alteration was imperative, as it has for some time been adopted by every intelligent fancier. "In the previous editions of this work, Mr. Richardson was led into error, and described a pair of the spangled varieties of the Polish fowl under the head of spangled Hamburghs." (P. 51.) An authority in whom our readers may place implicit confidence says, in reply to our question:—"Mr. Richardson has evidently made a mistake in the spangled Hamburgh fowl—his engraving represents the Polish; but the spangled Hamburgh he has described under the head of the Dutch every-day layers, &c. We have therefore brought the various named under the present head, transferring the figures named spangled Hamburgh to their proper place under the Polish fowl." (P. 55.) Small thanks, however, are given to the gentleman who first caused the Polish and Hamburgh armies to be marshalled in regular rank and file. "Much confusion seems to exist with regard to the spangled varieties of the domestic fowl. The Rev. Mr. Dixon has attempted to clear up the subject in the *Agricultural Gazette*, and more recently in his working on 'Ornamental Poultry;' taking occasion, *en passant*, to exhibit more of the angry spirit of rivalry, when criticising the present work, than befits the simplicity and earnestness of the inquirer after truth." (P. 54.) We venture to say that there was *no* anger in the matter, and, in Irish idiom, *less* rivalry, though there *was* an earnest inquiry after truth, which has not been unsuccessful. The *angry* passage which called forth the rebuke is this:—"Richardson gives the name of Hamburghs to the gold and silver Polands, a top-knotted variety. Dickson, in his brief, careless, and very loose description, is right in asserting the breeds, both of golden and silver Hamburghs, to be combed." We should call this a case of "drawing it mild."

The editor of this new edition has carefully studied and freely used the second edition of "Ornamental Poultry," with and without acknowledgment. Of this hardly any author will complain, if it be done in a way not likely to affect his pecuniary interest in his works. To be quoted and copied is a compliment, the sincerity of which cannot be doubted; but he may complain, or his friends may for him, if he is made responsible for instructions which he never issued. Thus, at p. 81, we find—"Every district seems to have its own peculiar mode of fattening turkeys. Mr. Dixon recommends a mode of diet that I have never seen tried, and wonder much if it be as efficacious as he seems to imagine. 'No food makes their flesh whiter and more delicate than kitchen stuff, *or the dregs of melted tallow (!)*, more or less of which must be boiled according to the number that is to be fed; and being diluted in a boiling kettle, plants (and especially nettles chopped up), and potherbs are mixed with it,'" &c., &c. Now, we have searched in vain in the "Ornamental Poultry" for this extraordinary recommendation, but on turning to *Walter B. Dickson's* "Poultry," at p. 236, we find the passage word for word. Had poor Richardson been alive, he would have blushed at the discovery of such misquotation, and apologised for it to the author. This is not the only place in which Dickson is confounded with Dixon, to the disadvantage of the latter writer, who ought not thus to be made responsible for the faults of others, besides those which he may himself have committed.

Setting aside these little blemishes, the work is creditable to Messrs. Orr and Co. It is now the best of the cheap poultry books, and the wonder is how it can be sold for a shilling. There are several additional cuts, some, as at p. 56, of considerable merit. A few slips of the pen will be rectified another time, as at p. 43, where the period of incubation of the turkey is made 31 days; at p. 98, where "the bernacle goose is *still smaller* than the brent goose;" and at p. 102, where "there are at present, I understand, only *three* specimens of this interesting variety (*Anser albibrons*, or white-fronted goose), in a state of domestication in the British islands." We think, too, that the publisher of the "Ornamental poultry" has a right to find fault with the adoption of the name of *his* book, even as a second title. He may be inclined to think—

"Who steals my purse, steals trash; 'tis something, nothing;
But he that filches from me my *good name*,"

violates, if not literary etiquette, certainly literary equity by the assumption; and does as he, perhaps, would *not* be done by.

## Miscellaneous.

*Insufficient Capital.*—The best illustration we have seen of the losses arising from insufficient capital, was taken from the experience of the sailor who related it. He had had charge of many vessels on different occasions: when under able and liberal ownership they were well manned and well furnished in every respect; but this was not always the case. The greater economy of such a course was, however, always evident: varying circumstances of weather could then be taken advantage of or guarded against immediately; and no loss, either of time or of property, occurred by those precautions (or the failure of them) which are necessary where a short number of hands are on board; for in that case, they must commence every operation long before it is needed, and, perhaps, fail to complete it in time after all. Just so with the farmer. If he has all the necessities laid upon him which large extent of land imposes, and only the means which a small extent requires, he will be continually behind-hand with his operations, unable to take advantage of favourable circumstances, and unable to guard against those which are adverse: the one will be past before he is prepared to benefit by them, and the other will be on him before he is prepared to meet them. *J. C. M., in Morton's Cyclopedia of Agriculture.*

*Drainage and the Turnip Crop.*—The Turnip has with truth been called "the root of good husbandry." It may be likened to a miner; for it explores the soil, and brings up from it much valuable material, in a state fit to be converted into beef and mutton, while the refuse of that conversion forms food for new tribes of plants. Like a miner, however, it cannot work unless the mine be kept "water free." It cannot be called "the root of good husbandry," when it barely replaces the manure which may have been supplied to it. It is only when it yields fair crops that it is so; and in order to obtain these, the first requisite is to have the land freed from stagnant water. *Morton's Cyclopedia of Agriculture.*

*Short-horn Cattle.*—The North Riding is bounded on the south by the East and West Ridings, on the north by the river Tees, which separates it from Durham, and is traversed by the York and Newcastle Railway from York to the borders of the county near Darlington. The central and northern portions of the riding, situated along the valleys of the rivers, contain the greatest extent of valuable land. To the eastward lie the Yorkshire moors, comprehending an extent of 400,000 acres, and rising from 1000 to 1500 feet above the sea level. On the west the country rises to the highlands on the borders of Westmoreland, with rich valleys of pasture land skirting the streams which drain that limestone country and flow through the picturesque dales of the North Riding. Much of the best land in the lower portion of the district is kept in permanent pasture, and in the neighbourhood of Northallerton, Catterick, and along the southern bank of the Tees, are found the most celebrated herds of short-horn cattle which now exist in England. The opposite bank of the Tees, which gave the name to the breed of Durham cattle, has lost its principal men, the Collings, and the best herds may now be said to be confined to the south side of Teesdale. There are still to be found men who have been bred from their childhood to study the peculiarities of form and symmetry which, combined with early maturity and great weight, have given the improved short-horn its great celebrity. Seldom leaving home, often the first to see their stock in the morning, and the last to visit them at night, making the health of each individual of the herd a study, and with constant attention enabled by particular management to encourage the development of such points as they think requisite, while everything else on the farm is made subordinate to the stock—these men have acquired a fame which is the result of such earnest application, and cannot long be maintained without it. They succeed; and to all parts of the United Kingdom is diffused from the hands of not half a dozen men in the North Riding the blood which has improved, and continues to improve, the native breeds of every district into which it is introduced. Two, three, or four hundred pounds for a bull is no uncommon price, and a cow of rare form and breeding has been bought by a farmer for 300 guineas. Ireland and Lincolnshire borrow for a season the best animals which leave the district, and the Messrs. Booth have at this moment bulls which bring them in 100*l.* a year each, and are let to the same parties at that rate for a succession of years. But these prizes are only to the most successful, for many, tempted by these and similar rates, try the system without counting the cost of patient study, constant application, and liberal outlay, by which such success has been achieved. It is not merely the first outlay, however lavish, that will place the beginner in the rank of a first-class breeder of short-horns. He must be prepared to sacrifice every other consideration on his farm to their welfare, and after he has collected his herd, and fed and watched them with the utmost care, he must stand the risk and uncertainty attending their management. If too fat, they cease to breed, or they produce dead calves; if too lean, they lose caste, and their produce sells at second-rate prices. One of the most experienced men in the district—himself an eminent breeder and first-rate judge—informed us that one season 34 of his high-priced and high-bred cows missed having calves, and so great are the risks attending this business that it is every year narrowing itself into fewer hands.—*Report on the Agriculture of Yorkshire, by the Times Commissioner.*

METEOROLOGICAL REPORT.—Feb.-March.
(*Continued from page* 140.)

| Date. | Time. | Max. | Min. | Wind.—Weather. |
|---|---|---|---|---|
| Feb. 27 | 7.15 a.m. | 30.26 | ... | NNW. Fine, but cold; light winds. |
| " | 5.15 p.m. | ... | 30.23 | 5 p.m., dense clouds in west. |
| 28 | 7.30 a.m. | 30.24 | . | N. and NNE. Bitterly cold; |
| | 2 p.m. | ... | 30.23 | overcast, with moderate breezes. |
| | 10.5 p.m. | 30.24 | ... | Evening, calm. |
| March 1 | 7.30 a.m. | 30.20 | ... | NNW. Gentle breezes, and |
| † | 5.20 p.m. | ... | 30.13 | fine, with heavy clouds p.m. |
| Sun. 2 | 7.50 a.m. | ... | 30.23 | NNW. Brisk breeze; fine |
| ‡ | 10.50 p.m. | 30.30 | ... | a.m.; cloudy p.m., and calm. |

* The continued back current of the storm of preceding days, my opinion of which, as expressed in last week's report, is confirmed by more matured reflection.

† I anticipate a heavy gale, a long way to the westward, from this storm, passing from Newfoundland towards Iceland; the rise of the barometer, which was suspended under its temporary influences, was resumed ‡ on the following day.

Dorchester, March 5th. *F. P. B. M.*

(*To be continued.*)

## Calendar of Operations.

MARCH.

Lammermuir Sheep Farm, *March* 1.—February, like every other month of the past winter, has been "uncommonly fine," though the latter half of it, in this district at least, has had the additional recommendation of being "unusually dry." This is of immense importance to hill flocks. A winter may be half over with little frost and no snow storm; but if, instead of these, there has been much rain, sheep may be in rather poor condition—a continual course of raw weather subjecting them to the great discomfort of wet skins, with the additional aggravation of cold damp beds and sodden food. Such a state of matter has, to a considerable extent, characterised the last season, and its effects are now visible, especially on the ewes, which, though far from being poverty-stricken, are scarcely so fresh as we would have expected, and certainly, comparatively leaner than the hogs, whose jackets have been of great service to them. Our crops of Turnips being good, we propose bringing in the shearling Cheviots, and a few of the thinnest ewes on the 31, and the remainder of the old ewes about the middle of the month, to allow, if possible, six weeks' Turnips to the former and four to the latter, before the lambing begins. The work on the arable part of the farm has consisted in ploughing for Oats after Potatoes and Turnips, and in carting out manure

for next year's green crop—a tedious process, owing to the distance of the field, and steepness of the ground—which will serve us for another week. We are getting home a supply of guano, placing it under cover, and spreading a coating of charred peat over it. We propose beginning the sowing of Oats about the middle of the month, weather permitting, and are preparing seed for this purpose. *A Lammermuir Farmer.* [Pray send it always to *Whitfield.*]

## Notices to Correspondents.

DISEASE IN SHEEP: *P O.* The disease is either the foot-rot or what is commonly termed the epidemic, or the foot disease. The former is caused by excess of moisture, which will also greatly increase the latter, though it is referable to another cause, such as infection. Moderate paring and a strong styptic, such as the muriate of antimony, are the best remedies, assisted by a dry place to lie on. The lamb will not take the disease before it is born, but may afterwards from infection, though this is not very likely. *W C S.*

EGGS: *D U.* You will find a fuller answer than we can give here, in Dixon's "Ornamental Poultry," 2d Edit., p. 175; by no means immerse them in water.

GRASS SEEDS: *Novice.* Plough the stubble at once; it ought to have been ploughed in autumn. Let it lie for a month, then fork it over, and thoroughly clean it; then manure it, and cultivate the manure in, or if you use guano harrow it in. Thereafter you may sow the seeds, selecting damp weather, and sow 6 pecks of Barley per acre along with them. For your soil sow Aira cæspitosa lutescens, 1 lb.; Alopecurus pratensis, 1½ lb.; Arrhenatherum avenaceum, 1 lb.; Avena flavescens, ½ lb.; Dactylis glomerata, 2 lbs; Festuca duriuscula, 3 lbs.; F. heterophylla, 1 lb.; F. loliacea, 1 lb.; F. pratensis, 2 lbs.; Lolium italicum 3 lbs.; L perenne, 5 lbs.; Phleum pratense, 1 lb; Poa nemoralis, 3 lbs.; P. trivialis, 1 lb.; Trifolium pratense, 3 lbs.; T. repens, 4 lbs. In all, 33 lbs. per acre.—*Street.* For deep mossy land, intended to be in Grass, Mr. Lawson recommends "with a crop," Agrostis stolonifera, 2 lbs.; Alopecurus pratensis, 1½ lb.; Festuca duriuscula, 2 lbs.; Lolium perenne, 6 lbs.; L. italicum, 3 lbs.; Phleum pratense, 2 lbs.; Poa trivialis, 2 lbs.; Trifolium repense, 5 lbs.; Lotus major, 1 lb. In all, per acre, 24½ lbs.—*An Old Subscriber.* For a stiff soil, the following is a proper list per acre, sown with a crop of Barley:—Aira cæspitosa *lutescens*, 1 lb.; Alopecurus pratensis, 2 lbs.; Arrhenatherum avenaceum, 2 lbs.; Dactylis glomerata, 3 lbs.; Festuca heterophylla, 2 lbs.; F. elatior, 2 lbs.; F. duriuscula, 2 lbs.; F. loliacea, 2 lbs.; F. pratensis, 2 lbs.; Lolium italicum, 3 lbs.; L. perenne, 5 lbs.; Phleum pratense, 2 lbs.; Poa nemoralis, 2 lbs.; P. trivialis, 2 lbs.; Trifolium pratense *perenne*, 3 lbs.; T. repens, 4 lbs. In all, per acre, 39 lbs.

KOHL RABI: *Cottage Farm.* We have no account of experiments with superphosphate on Kohl rabi; and though we should suppose it would be beneficial, yet we are safe in advising you to prefer guano at the rate of 4 or 5 cwt. per acre. Superphosphate is sent in bags. It varies exceedingly in its weight per bushel according to the state of dampness in which it is. About Kohl rabi, we will insert Mr. Towers' remarks as soon as we have published a great accumulation of matter now in type.

SMALL FARM: *S H N.* The value of your farm is to be arrived at by an examination of the soil and the circumstances of the case; not by considering what expenditure you have made on it. The profitableness of that expenditure is to be determined by the value of the land—not the value of the land by the assumed profitableness of the expenditure. Your offer as regards tenant right is the utmost you can make in the absence of an ability to grant leases. The reasonableness of the rent you demand cannot be determined by the data with which you have furnished us.

# Markets.

### COVENT GARDEN, MARCH 15.

Grapes have not altered in price since our last report. Good Pine-apples are somewhat scarce and dear, and the supply of dessert Pears is limited. English Apples are scarce. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. A few forced Strawberries have made their appearance. Vegetables of all kinds are abundant and good. The trade for French Beans and Cucumbers is improving. Carrots and Turnips are good in quality. Potatoes are a trifle dearer. Lettuces and other saladiog are sufficient for the demand. The best Mushrooms fetch 1s. 6d. per pottle. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Double Primroses, Stephanotis floribunda, Cinerarias, Moss and Provins Roses, and the different kinds of spring bulbs.

FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 6s to 8s | Oranges, per doz., 9d to 2s |

| Asparagus, per 100, 4s to 10s | Horse Radish, p. bundl., 1s to 4s |
| Rhubarb, p. bundl., 6d to 1s 2d | Red Beet, per doz., 6d to 1s |
| Potatoes, per ton, 60s to 100 | Mushrooms, p. pot., 6d to 9d |
| — per cwt., 3s to 6s | Sorrel, per hf. sieve, 6d to 9d |
| — per bush., 1s 6d to 3s | Fennel, per bunch, 2d to 3d |
| Turnips, p. doz. bundl., 1s to 2s | Savory, per bunch, 2d to 3d |
| Cucumbers, each, 1s 6d to 3s | Thyme, per bunch, 2d to 3d |
| Radishes, per doz., 1s to 1s 6d | Parsley, per doz. bun., 2s to 3s |
| Celery, p. bundle, 6d to 1s 6d | — Roots, p. bundl. 9d to 1s |
| Carrots, per doz., 2s to 5s | Marjoram, per bunch, 2d to 4d |
| Spinach, per sieve, 1s to 1s 6d | Mint, green, per bunch, 4d to 6d |
| Onions, p. bunch, 3d to 4d | Watercress, p. 12 bunch., 6d to 9d |
| — Spanish, p. doz., 1s 6d to 4s | Corn Salad, p. hf. sieve, 1s to 1s 6d |
| Leeks, per doz., 9d to 1s | |

POTATOES.—SOUTHWARK, March 10.

The Committee report that the market is well supplied coastwise and per rail. Trade is very heavy, and it is with difficulty the following prices are supported:—York Regents, per ton, 70s. to 90s; Scotch do., 60s. to 70s; ditto Cups, 60s. to 70s.; Cambridgeshire and Lincoln Regents, 50s. to 75s.; French whites, 55s. to 60s.

HAY.—Per Load of 36 Trusses.

SMITHFIELD, March 13.

| | | | |
|---|---|---|---|
| Prime Meadow Hay | 75s to 80s | Clover ... ... ... | 70s to 80s |
| Inferior ditto .. ... | 60 70 | Second cut ... ... | 63 70 |
| Rowen ... ... ... | 60 65 | Straw ... ... ... | 23 28 |
| New Hay ... ... | — — | | J. COOPER. |

The supply short, and trade brisk.

CUMBERLAND MARKET, March 18.

COAL MARKET.—FRIDAY, March 14.

Holywell 14s.; Eden Main, 13s. 6d.; Cowpen Hartley, 14s.; West Hartley, 14s.; Wallsend Haswell, 15s. 3d.; Wallsend Stewarts, 15s. 3d.; Wallsend Trees, 15s. 3d.; Wallsend Hurton, 13s. 3d.—Ships at market, 229.

HOPS.—FRIDAY, March 14.

Messrs. Pattenden and Smith report that colourv samples meet a ready sale; low descriptions hang on hand.

| | | | |
|---|---|---|---|
| Mid & East Kents | 70s to 120s | Sussex ... ... | 60s to 84s |
| Weald Kents ... | 64 — 90 | Yearlings & old Hops | 20 to 40 |

SMITHFIELD, MONDAY, March 10.

We have a larger supply of Beasts, and the weather being unfavourable trade is dull, and 3s. 8d. must be considered an extreme quotation. The number of Sheep is about as of late. Trade on the average is worse, the demand being very limited. Although the number of Calves is not large, it exceeds the demand; prices are reduced about 4d. per 8 lbs. From Holland and Germany there are 414 Beasts, 1250 Sheep, and 85 Calves; from Norfolk and Suffolk, 2400 Beasts; from Scotland, 300; and 200 from the northern counties.

| Per st. of 8 lbs.—s d s d | Per st. of 8 lbs.—s d s d |
|---|---|
| Best Scots, Hereford &c. ... 3 6 to 3 8 | Best Long-wools . 3 8 to 4 0 |
| Best Short-horns 3 2 — 3 6 | Ditto Shorn ... ... |
| 2d quality Beasts 2 6 — 3 0 | Ewes & 2d quality 3 0 — 3 6 |
| Best Downs and Half-breds ... 4 4 — 4 6 | Ditto Shorn ... ... |
| Ditto Shorn ... ... | Lambs ... ... ... |
| | Calves ... ... 3 0 — 4 2 |
| | Pigs ... ... 3 0 — 3 8 |

Beasts, 3779; Sheep and Lambs, 19,170; Calves, 131; Pigs, 350.

FRIDAY, March 14.

The supply of Beasts is small—equal, however, to the demand; indeed, it is so difficult to obtain Monday's top quotations for anything, we cannot retain them. The number of Sheep is very inconsiderable; trade is flat at Monday's prices. There are several remarkably fine Lambs on offer, but being so little in request, they make low prices. Trade is dull for Calves, and 4s. 4d. is only obtained in a few instances. From Germany and Holland we have 66 Beasts, 410 Sheep, and 115 Calves; from Scotland, 40 Beasts; from Norfolk and Suffolk, 200; and 70 milch cows from the home counties.

| Best Scots, Hereford, &c. ... 3 4 to 3 6 | Best Long-wools . 3 8 to 4 0 |
|---|---|
| Best Short-horns 3 2 — 3 4 | Ditto Shorn ... ... |
| 2d quality Beasts 2 4 — 3 0 | Ewes & 2d quality 3 0 — 3 6 |
| Best Downs and Half-breds ... 4 2 — 4 6 | Ditto Shorn ... ... |
| Ditto Shorn ... ... | Lambs ... ... ... |
| | Calves ... ... 3 0 — 4 4 |
| | Pigs ... ... 3 0 — 3 8 |

Beasts, 555; Sheep and Lambs, 2720; Calves, 215; Pigs, 375.

MARK LANE.

MONDAY, MARCH 10.—The supply of English Wheat this morning was very small, and disposed of on fully the terms of this day se'nnight. The tone in the foreign trade is slightly improved, and although the business transacted was not extensive, last week's prices were realised.—Fine malting Barley is much wanted, and the turn dearer, grinding qualities are held firmly.—Beans meet a somewhat improved inquiry at our quotations.—Peas remain difficult of disposal.—Oats command the extreme rates of last week.—Flour is in better demand, and for some marks a trifling advance was realised.

| PER IMPERIAL QUARTER. | s. s. | | s. s. |

FRIDAY, March 17.—With the exception of 34,710 qrs. of foreign Wheat, almost entirely from southern Europe, and 5210 sacks of French Flour, the arrivals this week have been small; a large proportion of the former is going to granary for the owners' account. The attendance at market this morning has been thin. There was no English Wheat offering, and holders not being disposed to give way in the price of foreign, we note no alteration from Monday.—Barley is rather more inquired for, which is also the case with Oats.—Beans or Peas meet very little demand.

LIVERPOOL, TUESDAY, MARCH 11.—The arrivals from Ireland and coastwise during the past week have been pretty liberal of Oats, Oatmeal, Barley, and Malt, but small of other articles. At this day's market there was a fair attendance of the town and country trade, who at first showed some disposition to do business, but eventually restricted their transactions to a few retail purchases for the supply of their immediate wants. Fine parcels of Wheat and Flour maintained the rates of this day week in the sales made, but inferior was easier to buy. Oats and Oatmeal in limited request, and nominally without alteration in value. Egyptian Beans were in good demand at 21s. per qr., but 21s. 6d. being asked, sales were unimportant. Barley and Peas quite neglected.——FRIDAY, MARCH 7.—The sale of Wheat and Flour at our Corn Exchange this morning was even more limited than of late, but prices stand unchanged. Egyptian Beans declined 6d., and Indian Corn 6d. to 1s. per qr. from Tuesday's prices. There was no variation in the quotation of any other article of the trade, with quite a restricted demand.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND CO., of Lamb's-buildings, Bunhill row, London, the Manufacturers and only Patentees o THE ASPHALTED FELT FOR ROOFING

Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained two SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

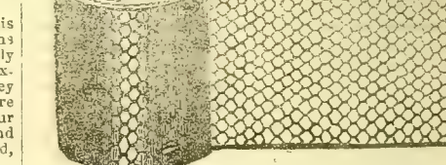
It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S



Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | |
|---|---|---|---|
| 12 inches wide | 3d. per yard. | 30 inches wide | 7½d. per yard. |
| 18 " | " 4½d. " | 36 " | " 9d. " |
| 14 " | " 6d. " | 48 " | " 1s. " |

Galvanised do., 1d. per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1s. 6d. per running yard; if galvanised, 2s. Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1s. 10d. per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6d. per running foot; Flower Trainers, from 3d. each; Garden Arches, 20s. each. Flower Stands, from 3s. 9d. each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wirework; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 41, Skinner-street, Snow-hill London.

DEAFNESS.—New Discovery.—THE ORGANIC VIBRATOR; an extraordinary, powerful, small, newly-invented instrument, for deafness, entirely different from all others, to surpass anything of the kind that has been, or probably ever can be produced. It is modelled to the ear, so that it rests within, without projecting. Being of the same colour as the skin, it is not perceptible. Enables deaf persons to enjoy general conversation, to hear distinctly at church and at public assemblies. The unpleasant sensation of singing noises in the ears is entirely removed, and it affords all the assistance that possibly could be desired. Invaluable newly-invented Spectacles, Powerful Telescopes, Opera and Race Glasses; also a curious, very small, powerful, Waistcoat-pocket Glass, only the size of a Walnut, to discern objects at the distance of four or five miles.—S. and B. SOLOMONS, Aurists and Opticians, 39, Albemarle-street, Piccadilly, London.

UNADULTERATED COFFEE.

KNIGHT AND SONS, TEA-DEALERS, GROCERS, &c., 83, Gracechurch-street, next the Spread Eagle. The Analytical Sanitary Commissioners of the *Lancet* Medical Journal, have been and are now engaged in an eminently beneficial inquiry into the system of adulterating various articles of human food which their investigations have proved to be all but universally prevalent. They have recorded that, out of a very large number of shops whose coffees they tested, only two proved to be pure. One of these is KNIGHT and SONS, 83, Gracechurch-street, whose Coffees are declared by the Commissioners to be of excellent quality and high flavour, and at reasonable prices. 1s. 4d., 1s. 8d., and 2s per lb. Every other article of Grocery equally genuine. Country orders, accompanied by a post-office order, or a reference for payment in London, will meet attention.

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—In consequence of a very inferior article being now too frequently sold under the name of these favourite Ales, the public are respectfully requested to apply at the respective stores, where a list of bottlers will be furnished, from whom these ales may be obtained genuine, and where also they may be had in casks of 18 gallons and upwards, either singly or in any quantity. Apply to Messrs. SAMUEL ALLSOPP and SONS, The Brewery, Burton-on-Trent, or their Stores, at 61, King-William-street, City; Cork-street, Liverpool; High-street, Birmingham; the Exchange, Manchester; and 83, Virginia-street, Glasgow.

# KIDD'S EMBROIDERED AND SILVERED GLASSES.

MANUFACTORY—12, POLAND-STREET, OXFORD-STREET, LONDON.

MR. WILLIAM KIDD, of the NEW ROAD, HAMMERSMITH, begs to announce to his Friends and the Public, that the *unique* Specimens of his New Invention, now perfected, and which he is about to forward to the "World's Great Fair" in Hyde Park, may be viewed by Ticket, procurable at his Manufactory, as above, until FRIDAY next, the 21st inst.

HER MAJESTY AND H.R.H. PRINCE ALBERT, before whom Mr. KIDD has had the honour, by SPECIAL DESIRE, of submitting and explaining his beautiful and ingenious Process, have been pleased to speak of the Invention in terms of the highest praise.—12, POLAND-STREET, March 15.

DALSTON NURSERY.

Household Furniture, a splendid collection of Prints, in Maple Frames, Books, China, and Glass. A capital eight-day Clock. Counting-house Fittings, Iron Safe &c.

MESSRS. PROTHEROE AND MORRIS are instructed, by the Administrator of the late Mr. John Smith, to submit to public competition, by Auction, on the premises, Dalston Nursery, Middlesex, on TUESDAY, March 18 1851, at 12 o'clock, the genuine HOUSEHOLD FURNITURE, consisting of Brussels Carpets, sets of Chairs, Spanish Mahogany Four-post and other Bedsteads, Goose Feather-beds, and Bedding, Chests of Drawers, Sofa, Mahogany, Loo and other Tables, Cheffonier, Barometer, &c. The erection of Sheds, a capital Four-wheel covered Van, Tumbrel Cart, and sundry effects.—May be viewed one day prior to the sale, and Catalogues had of the principal Seedsmen in London; on the premises; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on WEDNESDAY, March 19, at 12 o'clock, a first-rate collection of Carnations, Picotees, Pinks, and Auriculas; also Standard and Dwarf Roses, Gooseberries, Dahlias in Roots, &c.; the property of Mr. WILLMER. May be viewed the morning of Sale.—Catalogues had at the Mart, and of the Auctioneers, Leytonstone, Essex

TO GENTLEMEN, FLORISTS, AND OTHERS.

600 Pairs 1st Class Carnations and Picotees for Absolute Sale.

MESSRS. PROTHEROE AND MORRIS have received instructions to Sell by Auction, at the Mart, Bartholomew-lane, on THURSDAY, March 20th, the whole of the Genuine Stock of first-rate Carnations and Picotees, of Mr. KEYNES, Nurseryman, Salisbury, who is declining their growth. The Stock is in first-rate order, and fine growth, and contains all the leading Flowers, including Flora's Garland, Admiral Curzon, Cartwright's Rainbow, Rev. J. Bramhill's Lorenzo; Headly's Venus, Green's Queen, Julier, Lord H. Moore, &c. &c. Catalogues may be had on application to JOHN KEYNES, Nurseryman, Salisbury; at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

IMPORTANT SALE OF CAMELLIAS, STANDARD AND DWARF ROSES, &c.

MESSRS. PROTHEROE AND MORRIS are directed to sell by Auction, at the Mart, Bartholomew-lane, on FRIDAY, March 21, at 12 o'clock, about 200 Double Camellias, beautifully set with bloom buds, from 18in. to 5 feet; also 600 Standard and Dwarf Roses, consisting of Hybrid Perpetuals, Noisettes, Bourbons, &c.; Azalea indica, Cytisus, &c.—May be viewed the morning of Sale. Catalogues had at the Mart; and of the Auctioneers, Leytonstone, Essex.

HACKNEY.—TO GENTLEMEN ENGAGED IN ORNAMENTAL PLANTING, AND THE TRADE.

Unreserved Sale of Evergreen Trees and Shrubs, the Lease expiring of part of Messrs. Loddiges' Nursery.

MR. J. C. STEVENS is directed to sell by Auction, on the premises, at Hackney, on TUESDAY, 25th March, and following day, at 12 for 1 o'clock, a selection of EVERGREEN TREES AND SHRUBS, consisting of Hollies in great variety, of extraordinary fine growth, from 3 to 7 feet; beautiful flowering plants of Andromeda floribunda, and Rhododendron campanulatum; also some large specimens of Æsculus rubicunda (the true Scarlet Horse Chestnut). &c.—May be viewed on the day prior, and mornings of sale, and Catalogues had of Messrs. LODDIGES, Hackney; and of Mr. J. C. STEVENS, 38, King-street, Covent-garden.

FOR EXHIBITION.

Specimen Cape Ericas, Epacris, Camellias, Azaleas, New Holland Plants, First-rate Geraniums, Hot-house Plants, &c.

MESSRS. TAYLOR AND SON, UPHOLSTERERS and AUCTIONEERS, 49 Coney-street, York, have the honour to announce to the Nobility, Ladies, Gentry, and Public generally, that, in consequence of Mr. THOMAS JACKSON going abroad, they have received instructions from Messrs. JACKSON and Co., Nurserymen, Scruton, Bedale, to sell by Auction, at their Nursery, and without reserve, on WEDNESDAY, the 19th day of March, 1851, their immense and magnificent Collections of EXOTICS, rare HARDY CONIFERÆ, and Scarlet HIMALAYAN RHODODENDRONS. The Coniferæ are very handsome specimens (all from Seed, in pots), especially the Cryptomerias, the Deodaras, the Abies Douglassii, and a Californian Pinus, with foliage 11 inches in length. To persons beautifying their Hothouses, Greenhouses, Conservatories, Parks and Pleasure Grounds such an opportunity rarely occurs. Messrs. T. and SON can with confidence state that this is the grandest Collection they have ever had the honour to announce for sale. Catalogues will be ready on the 12th inst., and may be had on application to the Auctioneers, or to Messrs. JACKSON and Co. The whole of the Plants will be on view on Monday and Tuesday prior to the day of sale. The sale to commence precisely at 10 o'clock, A.M., on Wednesday the 19th of March, 1851.

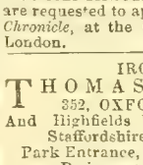
N.B. The Scruton Station, on the Bedale Branch, York, Newcastle, and Berwick Railway, is only five minutes' walk from the Nursery.

Auctioneer's Office, 49, Coney-street, York.

TO MARKET GARDENERS, NURSERYMEN, & OTHERS.

TO BE LET, and entered on immediately, about 2500 feet of GLASS, well stocked with excellent young Vines, just coming into full bearing, and a choice collection of Orchidaceous, Stove, Greenhouse, and Hardy Plants, fit for immediate sale; with a neat COTTAGE, and 6 or 7 acres of Land, as may be convenient to a person taking the same, situated in a most sheltered and picturesque spot, about three miles from the increasingly populous town of Southampton, which communicates by railway with the metropolis, and all other parts of England. Some of the soil is peculiarly adapted for a Nursery of American Plants. The stock to be taken at a valuation.—For particulars, apply to JAMES TEE, Gardener, Aldermoor, near Shirley, Southampton.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.



Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

IRON GATES, HURDLES, &c.

THOMAS PERRY AND SONS, 352, OXFORD-STREET (NEAR HYDE-PARK), And Highfields Wrought and Cast-iron Works, Bilston, Staffordshire, Manufacturers of every description of Park Entrance, Carriage and Field Gates, Wickets, &c.; Plain and Ornamental Fencing and Palisading; Ox, Cattle, Sheep, and other Hurdles; Tree Guards, Garden Seats, Hay Racks, Wheelbarrows; Land and Garden Rollers, Stable Fittings, &c. &c.

The works being situated in the centre of the Staffordshire Iron district, THOMAS PERRY AND SONS are enabled to execute promptly orders to any extent with the greatest facility, of the best quality, and most moderate terms. A great variety of the above articles always kept in Stock at the London Warehouse, and at the Works. Drawings and prices may be obtained on application, or furnished free by post.

HORSE-KEEP, OAT-BRUISERS, CHAFF-CUTTERS. PLOUGHS, 42s.; SHARES, 5s. a dozen; Rollers, Wheat Mills, Bean Mills, Steam Engines, Scarifiers, Turnip Cutters, Dressing Machines, Drills, Threshing Machines, Wood and Iron Harrows, Steaming Apparatus, Scotch Carts, Haymaking Machines, Horse Hay-Rakes, Drug Mills. First Class Goods warranted. MARY WEDLAKE and Co, 118, Fenchurch-street, London. Most liberal discount for cash. Goods delivered free.

FOR PORT LYTTELTON, CANTERBURY SETTLEMENT, and other Ports in New Zealand, the first class passenger ship DOMINION, 584 tons register, lying in the East India Docks, chartered and provisioned by the Canterbury Association to sail on the 8th May.—Rates of passage: Chief Cabin (a whole cabin between decks), 42*l.*; Second Cabin, 23*l.*; Steerage, 16*l.*—For Freight, Passage, or further information, apply to FILBY and Co., 157, Fenchurch-street; J. STAYNER, 110, Fenchurch-street; or to FREDERICK YOUNG, Manager of Shipping for the Canterbury Association, 74, Cornhill.

Chartered by the Canterbury Association, and appointed to Sail from the Port of London on Tuesday, 8th APRIL.

FOR CANTERBURY, NELSON, and NEW PLYMOUTH, NEW ZEALAND, the fine passenger ship LABUAN, A 1, 547 tons register, lying in the East India Docks. Walter Scott, Commander.—Rates of passage to Canterbury, Provisions, Medicine, and Medical Comforts, included:—Each person 14 years old and upwards, Chief cabin, 42*l.*; Second cabin, 25*l.*; Steerage, 16*l.* Children under 14 one-half.—This ship has superior accommodations, and will take out a Clergyman, an Elementary Schoolmaster, and an experienced Surgeon.—For freight, passage, or further information, apply to J. STAYNER, 110, Fenchurch street; or to FILBY and Co., 157, Fenchurch-street. By order of the Committee, FREDERICK YOUNG, manager of shipping.—Shipping office of the Canterbury Association, 74, Cornhill, London.

HOLLOWAY'S OINTMENT AND PILLS, AN INFALLIBLE REMEDY FOR TUMOURS, SWELLINGS, AND CONTRACTED JOINTS.—Ann Carter, housemaid, residing with a family in Burton-crescent, had an immense Tumour on her right knee, which increased to such a size that she could not bend the joint, and was in consequence obliged to leave her situation; her medical attendant informed her that there was no chance of cure, and that it would be necessary to amputate the limb. This opinion not satisfying her, she commenced using HOLLOWAY'S PILLS AND OINTMENT in good earnest, and by God's blessing, they have been the means of effecting a perfect cure, and she has resumed her former situation. Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

THE TEETH.—How often do we find the human face divine disfigured by neglecting the chiefest of its ornaments, and the breath made disagreeable to companions by non-attention to the teeth. Though perfect in their structure and composition, to keep them in a pure and healthy state requires some little trouble; and if those who are blessed with well-formed teeth knew how soon decay steals into the mouth, making unsightly what otherwise are delightful to admire, and designating unhealthiness by the impurity of the breath, they would spare no expense to chase away these fatal blemishes. But although most ladies are careful, and even particular in these delicate matters, yet few are sufficiently aware of the imperative necessity of avoiding all noxious or mineral substances of an acrid nature, and of which the greater part of the cheap Tooth Powders of the present day are composed. It is highly satisfactory to point out Messrs. ROWLANDS' ODONTO, or PEARL DENTRIFICE, as a preparation free from all injurious elements, and eminently calculated to embellish and preserve the dental structure, to impart a grateful fragrance to the breath, and to embellish and perpetuate the graces of the mouth.—*Ladies' Gazette of Fashion.*

ROWLANDS' ODONTO is a white Powder compounded of the choicest and most *recherché* ingredients of the oriental herbal.—Price 2*s.* 9*d.* per box.

Sold by A. ROWLAND and SONS, 20, Hatton-garden, London, and by Chemists and Perfumers.

Price 3*d.*, or 5*s.* for 25 copies for distribution amongst Cottage Tenantry, delivered anywhere in London, on a Post-office order being sent to the Publisher, JAMES MATTHEWS, at the Office of the *Gardeners' Chronicle*.

THE COTTAGERS' CALENDAR OF GARDEN OPERATIONS.

By JOSEPH PAXTON.

Reprinted from the GARDENERS' CHRONICLE; above 61,000 have already been sold.

London: J. MATTHEWS, 5, Upper Wellington-street, Strand; and may be ordered of all booksellers.

ON THE FERTILIZERS.

By CUTHBERT W. JOHNSON, Esq., F.R.S.

The results of the practical application of every kind of Manure are contained in this Standard Work, and are now brought down to the present time. The Volume may indeed be regarded as a new work.

London: JAMES RIDGWAY, 169, Piccadilly.

Now ready, price 6*d.*

FLAX: its MANUFACTURE on SCHENCKS' PATENT SYSTEM; with directions respecting the Erection and Management of Retteries, or Steeping Establishments, followed by Practical Instructions on the Cultivation of Flax. By A. BERNARD and KOCH.

London: JAMES RIDGWAY, Piccadilly; M'GLASHAN, Dublin; and all Booksellers.

TOOTHACHE PREVENTED by using BRANDE'S ENAMEL for filling decaying Teeth, and rendering them sound and painless. Price 1s. Enough for several Teeth. The only substance approved by the medical faculty, as being unattended with pain or danger, and the good effects of which are permanent.

Sold by all Chemists in the United Kingdom. Twenty really authorised Testimonials accompany each box, with full directions for use. Sent free by return of post by J. WILLIS, 59, Fleet-street, London, in return for thirteen penny stamps.

CAUTION.—The great success of this preparation has induced numerous unskilful persons to produce spurious imitations, and to copy BRANDE'S ENAMEL advertisements. It is needful, therefore, to guard against such impositions, by seeing that the name of JOHN WILLIS accompanies each packet.

COMFORT FOR TENDER FEET, AND A CERTAIN CURE FOR CORNS AND BUNIONS.

PAUL'S EVERY MAN'S FRIEND,

Patronised by the Royal Family, Nobility, &c.

PAUL'S EVERY MAN'S FRIEND, which gives relief on the first application. Paul's Every Man's Friend (Corn Plaister) is generally admitted to be the best emollient application for Corns and Bunions, and is worthy of a trial on the part of those who are afflicted with such unpleasant companions. Testimonials have been received from upwards of 100 Physicians and Surgeons of the greatest eminence, as well as from many officers of both Army and Navy, and nearly 1000 private letters from the gentry in town and country, speaking in high terms of this valuable remedy.

Prepared by John Fox, in boxes, at 1s. 1½*d.*, or three small boxes in one for 2s. 9*d.*; and to be had, with full directions for use, of all wholesale and retail Medicine Vendors in Town and Country. The genuine has the name of "JOHN FOX" on the Government Stamp. A 2s. 9*d.* box cures the most obdurate corns. Ask for "Paul's Every Man's Friend."

Sold by Barclay and Sons, Farringdon-street; Edwards, 67, St. Paul's Churchyard; Butler and Harding, 4, Cheapside; Newbery, St. Paul's; Sutton, Bow Churchyard; Johnston, 68, Cornhill; Sanger, 150, Oxford-street; Willoughby and Co., 61, Bishopsgate-street Without; Eade, 39, Goswell-street; Prout, 229, Strand; Hannay and Co., 63, Oxford-street; Watts, 106, Edgware-road; and retail by all respectable Chemists and Medicine Vendors in every town in England. Wholesale Agents for Ireland and Scotland. Messrs. J. and R. RAIMES and Co., Druggists, Edinburgh.

THE HIPPOPOTAMUS, presented to the ZOOLOGICAL SOCIETY by H.H. the Viceroy of Egypt, is Exhibited daily at their Gardens, in the Regent's Park, from 11 to 4 o'clock. Visitors desirous of seeing the Animal in the water are recommended to go early.

Admission, One Shilling; on Mondays, Sixpence.

METCALFE AND Co's NEW PATENT TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1s. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co's, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2s. per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

# ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

MONTHLY STORY FOR YOUNG PEOPLE. By the Editors of the "Family Economist."

STORIES FOR SUMMER DAYS AND WINTER NIGHTS.

These well-written and beautiful stories will be found more acceptable in many respects for the monthly reading of the young than any Magazine, and equally interesting to readers of older growth. They are lively, instructive, and moral; adapted to entertain and improve—to inform the mind and educate the heart. Each story is illustrated with well-executed engravings. They are among the best and cheapest books for young people published.

Already published—I. The Sea Kings. II. Madeline Tube, and her Blind Brother. III. The Young Emigrants. IV. The Boy and the Book.

The above are now ready, in one volume, elegant binding, price 1s.; or separately, 3d. each.

OSCAR, a tale of Norway, will be published 1st of April.

London: GROOMBRIDGE and SONS, Paternoster-row, and sold by all Booksellers.

OFFICIAL CATALOGUE OFFICE, 29, New Bridge-street, Blackfriars, and at the Exhibition Building, Hyde Park.

REEVE and BENHAM, 5, Henrietta-street, Covent-garden.

ACTON'S COOKERY BOOK.

The Tenth Edition, in One Volume, fcp. 8vo, price 7s. 6d.

ELIZA ACTON'S MODERN COOKERY reduced to a System of Easy Practice; with Directions for Carving.

*** Both the *quantity* of every article necessary for the preparation of each recipe, and the *time* required for its preparation, are minutely stated.

"The whole of Miss Acton's recipes, with a few trifling exceptions, which are scrupulously specified, are confined to such as may be perfectly depended on from having been proved beneath our own roof, and under our own personal inspection. We add, moreover, that the recipes are all reasonable, and never in any instance extravagant. They do not bid us sacrifice ten pounds of excellent meat, that we may get a couple of quarts of gravy from it; nor do they deal with butter and eggs as if they cost nothing. Miss Acton's book is a good book in every way; there is right-mindedness in every page of it, as well as thorough knowledge and experience of the subjects she handles."—*Medical Gazette.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

SEED ESTABLISHMENT, MALDON, ESSEX.

HOLLYHOCK SEED.
EDWARD TILEY begs to inform the lovers of that beautiful flower that he has been successful in procuring a quantity of good sound SEED of the above from an Amateur Gentleman who has one of the most superb and choice collections in cultivation; the seed having been selected with every care and attention, he can confidently recommend it. Sold at 2*s.* 6*d.* per packet, containing 150 seeds, or 5*s.* for a packet of 400 seeds.
GERMAN ASTER SEED.
Unequalled for the superiority of flower, the shape of which forms that of half a globe, and has been admired by thousands of spectators at numberless exhibitions. There are from 20 to 30 varieties, 1*s.* per packet.
SWEET-WILLIAM SEED.
Saved from 24 superb varieties. The flowers are very large, and of dwarf habit. They were much admired when in bloom, by countless spectators, and the Seed numerously ordered by them; 1*s.* per packet.
ANTIRRHINUM SEED.
E. T. being a most extensive grower of all the choicest sorts known in cultivation, has selected the Seed with great care from the finest varieties, as to colour, shape and habit of plant. There are more than 50 distinct varieties; 1*s.* per packet.
DWARF ORANGE AFRICAN MARIGOLD SEED.
Unrivalled for its superior size and darkness of colour, many of the flowers last season measuring 5 inches over, and not more than 1 foot high; 6*d* per packet.
Or, if preferred, a 5*s.* packet of Hollyhock and a packet of each of the above varieties for 7*s.*

ADAM PAUL and SON, Nurseries, Cheshunt, Herts.

RIVERS'S STUBBLE SWEDE TURNIP SEED.
J. RIVERS solicits the attention of Agriculturists to his quick-growing SWEDE TURNIP. The variety owes its origin to a cross between a large variety of the Early Stone, in 1842, and the old Green Top Swede. It has become a distinct variety, by carefully selecting, for seven years, those most like the Swede in habit, so that now it is a true Swede, with the earliness of the White Stone; it is green-topped, with a short neck, with the solid yellow flesh of the common Swede; for sowing in May, for early feed, or for late sowing upon heavy land and sheep-fed leys, it will be found a valuable Turnip for hardiness and keeping qualities; also for sowing near large towns, to draw off early. It grew 11 tons per acre after Tares, mowed, without manure, on the 6th of August, 1849. Specimens of the roots were exhibited at the Baker street Cattle Show; also Specimen Roots of different times of sowing, from May till August, were exhibited. Orders for any quantity above 10 lbs. will promptly be attended to, if addressed to JOHN RIVERS, Seedsman, Sawbridgeworth, Herts, at 2*s.* per lb., carriage paid to London. It will be sold in sealed bags, of 2½ lbs., price 5*s.*, and 5 lbs., 10*s.*, by the following agents:—Aberdeen, Union-street, Mr. J. Roy; Ayr, N. B., Messrs. Imrie and Sons; Belfast, Messrs. Farrell and Co.; Bristol, Messrs. Garaway, Mayes and Co.; Carlisle, Messrs. Little and Ballantyne; Chester, Messrs. F. and J. Dickson; Chilwell, Nottingham, Messrs. J. R. and A. Pearson; Cirencester, Mr. R. F. Darby; Chichester, Mr. H. Silverlock; Clonmel, Ireland, Messrs. Higgins and Sons; Dunse, N. B., Messrs. Hogg and Wood; Dundee, Messrs. Urquhart and Sons; Edinburgh, Leith-walk, Messrs. Dickson and Co.; Exeter, Messrs. Veitch and Son; Folkestone, Mr. James Mickle; Glasgow, Messrs. Austin and M'Aslan; Inverness, Messrs. Howden (Brothers); Hull, Messrs. Dickson; Maresfield, Uckfield, Sussex, Messrs. Wood and Son; Malton, Yorkshire, Mr. John Sloter; Norwich, Exchange-street, Mr. Ewing; Plymouth, Mr. A. Pontey; Perth, Messrs. Dickson and Turnbull; Peterborough, Mr. Plutter; Reading, Messrs Sutton and Sons; Sudbury, Suffolk, Messrs. Bass and Sons; Sheffield, Messrs. Fisher and Holmes; Westerham, Mr. J. Catteil; York, Messrs. Backhouse and Sons.

ANEMONE Seed, saved from selected sorts, 2*s.* 6*d.* and 5*s.* per packet, per post-free.
YOUELL and Co., Royal Nursery, Great Yarmouth.

## NATIONAL FLORICULTURAL SOCIETY.—

Notice is hereby given, that a GENERAL MEETING will be held on THURSDAY next, the 27th instant, at the SOCIETY'S ROOMS, 21, REGENT-STREET, LONDON, to receive NOMINATIONS; for the ELECTION of MEMBERS; for the choice of OFFICERS; for the confirmation of RULES; and on other business. Chair to be taken at 2 o'clock, P.M., precisely. The first exhibition of Seedlings, &c., will take place on Thursday, April 3, at 2 o'clock.

JOHN EDWARDS, Hon. Secretary.

ADDRESS.—The want of a superior tribunal, to which all seedling Florists' flowers and hybrids should be submitted previously to being sent before the public, has for some time been felt; and it is proposed that the leading Nurserymen and Florists do organise a Society in London, where all Florists' flowers may be sent for the opinion of competent judges. That such an ordeal is absolutely necessary, is continually shown by the number of Florists' flowers that ought not to have been sold out as first-rate varieties; this in a measure is owing to many of the introductions being certified as first-class seedlings by censors who may have but a limited knowledge of the varieties already in cultivation. A Society so constituted, as to lessen or remove so great a tax on the lovers of flowers, should be universally supported by Nurserymen, Florists, and Amateurs; as the fact cannot be doubted that, in affording opportunities for the examination of seedlings before known and acknowledged authorities, the true interests of Floriculture will be permanently promoted. Several eminent Nurserymen, Florists, and Amateurs, both in London and the country, have urged the necessity for such a step, and wish to see a general Society formed, which shall, by its strictness and impartiality, be stamped as a necessary ordeal through which all seedlings should pass, and have promised to give it their support. Various suggestions have been offered. One extract will convey the general tone:—"Let the proposed Society be totally free from all partiality; it must be independent and honest; and to be useful, it must have the confidence of the public. Censors should be fixed, and their names published; in short, let it be that which *we all desire*, a tribunal to test new Florists' flowers and hybrids. Such will be liberally supported." To those parties engaged in the pleasurable pursuit of raising seedlings, the Society must prove invaluable. To the dealer such a tribunal will be of the utmost importance, relieving him of much responsibility and constant anxiety. To the purchasers of new Plants such a test will not only prove beneficial in a pecuniary view, but afford some security that the novelties annually offered possess at least claim to merit.

21, Regent-street, London, March 1st, 1851.

The following Gentlemen are among the early promoters of the NATIONAL FLORICULTURAL SOCIETY, of whom the printed Rules, &c., may be obtained.

Mr. Arthur Henderson, Pine-Apple Place, Edgeware-road, London
Mr. Charles Turner, Royal Nursery, Slough
Mr. John Salter, Versailles Nursery, Hammersmith
Richard Srams, Esq., New-road, London

G. W. Johnson, Esq., Winchester, Hants; Editor of the "Cottage Gardener, &c."

EXHIBITION AND MEETING-DAYS.*

1851.—Thursdays, March 27, at 2 o'clock P.M.; April 3 and 24, at 2; May 8 and 22, at 3; June 12 and 26, at 3; July 10 and 31, at 3; August 7 and 21, at 3; September 4 and 18, at 2; October 9, at 2; November 13, at 2; December 4, at 2.

1852.—Four days, January 8, at 2; February 5, at 2; March 5 (Anniversary), at 1.

* RULE 15.—That subjects for examination be at the Office at least two clear hours before the time fixed for such meeting, and be delivered carriage free; but in cases where it is impossible to pay the carriage through, the sender must refund any payment made by the officers of the Society, nor will any plant, flower, or package be acknowledged that has not the sender's name and address marked thereon, or otherwise made known by previous advice to the Secretary at the Office.

NEW SPRING CATALOGUE.
WOODLANDS NURSERY, MARKSFIELD, near UCKFIELD, SUSSEX.

WM. WOOD AND SON have now published a New CATALOGUE OF GREENHOUSE AND BEDDING PLANTS, copies of which will be forwarded free on application.

W. W. and S. N. beg to offer strong plants from their superb collection of Hollyhocks, at 6s., 9s., and 12s. per dozen; Cape Heaths, 9s, 12s., and 18s per dozen, strong and bushy; Chinese Azaleas, 9s., 12s., and 18s. per dozen, strong and bushy.

Chrysanthemums, best Continental vars, 6s., 9s., 12s.; Phloxes, 6s., 9s., 12s.

Extra plants will be presented with each order, as compensation for carriage.

TO NURSERYMEN, FLORISTS, &c.

J. LINDEN, 74, Chaussee de Schaerbeek, Brussels and Luxembourg, begs to inform Amateurs and the Trade that his Catalogue of New Plants for 1851 is now ready, and may be obtained gratis of his Agents, BETHAM and BLACKITH, Custom House and General Forwarding Agents, Cox's Quay, Lower Thames-street.

J. L. solicits attention to the new and remarkable Orchideous Plants with which the Catalogue abounds, as also to the following, a description of which will be found on the first and second page:—

| | | |
|---|---|---|
| FUCHSIA VENUSTA, H.B.K. strong plants, | 5s. to | 7s. 6d. |
| FUCHSIA NIGRICANS, LINDEN | Ditto | 3s. |
| BOMAREA EDULIS | Ditto | 7s. 6d. |

## NEW VALUABLE FLOWER SEEDS.—Portulaca

nova rosea, new Rose var., very handsome, 1s. per pkt.

| | | |
|---|---|---|
| Ipomœa Quamoclit alba, half-hardy | 1s. | ,, |
| ,, Burridgii, splendid hardy | 6d. | ,, |
| Saponaria Calabrica, var. multiflora | 6d. | ,, |

No garden should be without this most valuable Annual.

| | | |
|---|---|---|
| Martynia angularis, new and handsome | 6d. | ,, |
| Gloxinia, hybridised by a first-rate grower | 1s. | ,, |
| Calendrinia umbellata, new and handsome half-hardy Annual | 1s. | ,, |
| A few packets of Lisianthus Russellianus | 1s. | ,, |
| Tropæolum speciosum, very handsome | 1s. | ,, |

DUNCAN HAIRS' object, in selecting the above few Seeds from his collection, is to draw the particular attention of those who are fond of novelty and beauty. Amongst other departments of his business, D. H. prides himself on having some first-rate Seeds of Florist Flowers—viz., Calceolaria, Cineraria, Hearts-ease, Dahlia, Verbena, Carnations, Pink, Cockscombs, and Balsams, &c., in 6d and 1s. packets.

German Stocks and Asters in collections, 2s. to 5s.

109, St. Martin's-lane, Charing Cross, London.

Catalogues per post free.

## GEORGE MILLS, 15 years Steward and Gardener

to the late Baroness de Rothschild, at Gunnersbury-park, Ealing, Middlesex; 32 years F.H.S. of London; autnor of a Treatise on the Culture of the Cucumber, Melon, Seakale, and Asparagus; as also of a Treatise on the Culture of the Pine-apple; who has practised Horticulture, Agriculture, and Arboriculture 50 years, on the cold clay soils of Hants and Essex, as also on the light and warm soils of Bucks, Surrey, and Middlesex, begs most respectfully to offer his opinion on all subjects relating thereto, excepting Botany and Chemistry.

G. M. is induced to make the above offer from the advantage he derived in early life from the advice of a friend, his senior in practice. He has long been quite satisfied that the land under cultivation in this country, although great improvements have been made within the last 20 years by drainage, &c. &c., is still capable of greater improvement, and the hope of seeing those improvements carried out, induces him to offer his opinion thereon.

G. M. will give his opinion only where his experience will enable him to give it confidently.

Terms, 2l. per day, exclusive of travelling expenses; for less than a day, 1l.

GEORGE MILLS, Loraine Cottage, Hammersmith, Middlesex.

ESTABLISHED 1786.

## WILLIAM E. RENDLE AND CO., SEED MERCHANTS

by special appointment to the SOUTH DEVON AGRICULTURAL ASSOCIATION, and several influential Members of the Royal Agricultural Society, Union Road, Plymouth.

We have this season a choice and well assorted Stock of all the best FARM SEEDS. They have been grown and selected with the greatest care, and can be highly recommended as being of the most genuine quality. Our sale of Turnip Seeds alone last season exceeded *one thousand bushels*; our extensive dealings therefore enable us to sell at the lowest remunerating prices, and at the same time is the strongest evidence we can offer of the large and increasing patronage bestowed upon us, for which we have to return our most grateful acknowledgments.

## OUR DESCRIPTIVE CATALOGUE OF FARM SEEDS

*is just published, and can be had in exchange for One Penny Stamp. It contains a description of all the best varieties of Turnips, Carrots, and Mangold Wurzel, with prices affixed to every article. The list of Grasses is peculiarly comprehensive, and contains short descriptions of all the leading kinds. There is also some useful advice relative to the sowing of Grass Seeds for permanent pasture, concerning which* Mr. KEMP, *of Birkenhead Park, in a letter to us says:—"I am glad that you repudiate the practice of sowing Corn with Grass Seeds, a custom I have often had to combat."*

All Orders above 2l. Carriage Free. (See Catalogue.)

Apply to WILLIAM E. RENDLE and Co., Seed Merchants, Plymouth.

## STANWICK NECTARINE—SALE OF, IN AID OF THE FUNDS OF THE GARDENERS' BENEVOLENT SOCIETY.

Circumstances have rendered it necessary to modify the intentions expressed at p. 676 of the *Gardeners' Chronicle*, respecting the STANWICK NECTARINE. Upon examining the young plants in Mr. RIVERS's hands, it turns out that the number fit for sale is much smaller than was anticipated, and that there is a considerable difference in their quality. Applicants are moreover anxious to obtain their plants without loss of time, and without waiting for the chance of an auction which cannot take place, to the advantage of the charity, sooner than next spring. It has therefore been resolved to set aside the finest plants for sale at from 4 to 5 guineas each, and to dispose of others at 3 guineas each. Such as are unsold in the spring, if there should be any left, will be brought to the hammer as at first proposed.

Of the selected specimens, some are beautiful plants in pots, budded on the Peach stock, and covered with blossom-buds, so that they will fruit next year if repotted; for these five guineas will be charged. The remainder are very fine maiden plants in the open quarter, budded on Plum stocks, and without blossom-buds; for these 4 guineas are required. Gentlemen desirous of aiding the excellent charity to whose funds the produce of the sale of these plants will be applied, by order of his Grace the Duke of Northumberland, are requested to apply to Mr. WILLIAM BRAILSFORD, 21, Regent-street, London, giving their exact addresses, and stating by what conveyance the plants are to be transmitted from the station at Harlow, on the Cambridge line of the Eastern Counties Railway, where they will be delivered without further charge. It is requested that Post-office orders may be made payable to Mr. WILLIAM BRAILSFORD, who, upon their receipt, will return an order upon Mr. RIVERS for the transmission of the plants.

Applications will be complied with in the *exact order* in which they are received, and due notice will be given when the five guinea and four guinea plants are exhausted.

May we be permitted to express a hope, that although no pecuniary profit can be derived by nurserymen from a sale whose proceeds go to a charitable use, yet that they will, nevertheless, endeavour to make known, within the circle of their customers, the terms on which the Stanwick Nectarine may now be procured.

CABBAGE PLANTS.

SUPERIOR EARLY TRUE SORTS, Stout Bedded, 4s. 6d. per 1000, package included, delivered free of carriage to the Edenbridge Station, South-Eastern Railway; also CAULIFLOWER PLANTS, Early and Late, 4s. per 100; and RED CABBAGE, Stout Bedded, 1s. per 100, or 7s. 6d. per 1000. Address to JOHN CATTELL, Westerham, Kent.

LAYERTHORPE NURSERY, YORK.

HANNAH EDWARD, Widow of the late JAMES EDWARD, begs to return her sincere thanks to the friends and supporters of her late Husband, and to inform them that the Business of a NURSERYMAN, SEEDSMAN, and FLORIST, as heretofore conducted, will be continued for the benefit of herself and family under the superintendence of Mr. GEORGE EDWARD and the Executors; and Mr. GEORGE EDWARD begs to assure those friends by whom his Sister-in-law may be favoured with support, that every exertion will be used by him to execute their orders in such manner, and on such terms, as cannot fail to merit a continuance of the patronage so liberally conferred on his deceased Brother.

GEORGE EDWARD, in offering the following SEEDLING DAHLIAS and GERANIUMS, begs to state that they are faithfully described; and from their constancy in producing good Flowers, cannot fail to give the utmost satisfaction.

### SEEDLING DAHLIAS.

BEAUTY OF LAYERTHORPE—One of the most constant flowers ever raised; colour beautiful pink, tipped with bronze, petals well arranged, of good substance, size medium. Every flower fit for exhibition. Height 4 feet; price 10s. 6d.

QUEEN OF SCOTLAND—Creamy white ground with violet purple edge, first-rate form, of good substance, petals beautifully cupped and well arranged, very constant. Height, 4 feet; price 10s. 6d.

### FANCY DAHLIAS.

JETTY TREFFZ—Bright crimson, with clear white tip, good outline, and well up in the centre, large size, one of the best fancy Dahlias yet raised. Height, 4 feet; price 10s. 6d.

LOLA MONTES—Dark purple, distinctly edged with white, size large, a first-rate fancy variety. Height, 4 feet; price 10s. 6d.

### SEEDLING GERANIUMS.

| | £ | s. | d. |
|---|---|---|---|
| NORTHERN BEAUTY (EDWARD), bright crimson cloud, shading off to bright ruby, with clear blush margin, lower petals blush, of good substance, size large, form good, bold trusses, with superior habit | 1 | 1 | 0 |

| BRIDE (EDWARD), in the way of Beck's Bridesmaid, but much superior | 0 | 5 | 0 |

Layerthorpe Nursery, York, March 22.

## THE PRESENT IS THE PROPER SEASON FOR SOWING THE "ORACHE," SUPERIOR IN EVERY RESPECT TO SPINACH.—

The leading article of the *Gardeners' Chronicle* of January 25, 1851, fully bears out the above assertion, that this is one of the very best summer vegetables, superior to Spinach in its flavour, and possesses the advantage of affording a constant and permanent supply (without going to seed) of large luxuriant leaves throughout the summer months. It was most successfully grown last season at the seat of Joseph Hume, Esq., M.P., Burnley Hall, in this county, and much preferred to Spinach. Sealed packets 2s. 6d. and 5s. each, per post free, containing a sufficient supply for a large or small family.

Also may be had, Seeds of the "True Custard Gourd," a most delicious Vegetable Marrow. Packets containing 6 seeds, 1s., per post free. Payments by postage stamps or Post-office order—YOUELL and Co., Royal Nursery, Great Yarmouth.

SEED AND HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

## BASS AND BROWN'S SEED AND PLANT LIST FOR 1851

*is stamped as a Newspaper, to go free by post, and may be had on application. It will be found to contain the newest and best articles which can be procured, with full description and other useful information.*

SELECT AND CHOICE FLOWER SEEDS.

The following of our best selections supplied free by post, with proper directions for sowing, heights, colours, &c., given in the Catalogue.

| | s. | d. |
|---|---|---|
| 100 varieties best and newest Annuals | 15 | 0 |
| 50 varieties for 8s. 6d., 30 for 5s. 6d., 20 for | 4 | 0 |
| 20 varieties best dwarf kinds, in larger packets, suited for filling beds or lawns, 7s. 6d., or 12 do. for | 5 | 0 |
| 20 varieties best Greenhouse Annuals, 7s. 6d., 12 for | 5 | 0 |
| 20 varieties choice Greenhouse Perennials, 10s. 6d., 12 for | 7 | 6 |
| 20 vars. choice hardy Biennials and Perennials, 7s. 6d., 12 for | 5 | 0 |

IMPORTED GERMAN SEEDS.

| 20 varieties splendid double Stocks, 3s. 6d.; 12 ditto | 2 | 6 |
| 12 vars. splendid China Asters | 2 | 6 |
| 12 vars. fine globular Asters | 2 | 6 |
| 12 vars. Dwarf Rocket Larkspurs | 2 | 0 |
| 9 vars. Tall ditto | 1 | 6 |

Remittances with orders are requested from unknown correspondents. Goods Carriage Free to London, and with all orders of 2l. and upwards, articles presented extra. Post-office orders payable to BASS and BROWN or to STEPHEN BROWN.

## VIOLETS.—The month of April is the season for

planting the different varieties of this flower. They will not display any degree of bloom without a full summer's growth; they ought to be planted in a good sunny situation, in rich soil; and they will then amply repay the culture, by yielding flowers when they are the only floral attraction. For economy in culture, the best part of a garden may be used, as Tripoli Onions, Horn Carrots, or any dwarf vegetable in maturity at Midsummer, may be grown with them. I grow VIOLETS very extensively and successfully, and never allow them to occupy the ground without such interplanting. One dozen plants of the Russian Superb Violet will, by such culture, yield, from the 1st of September to the end of April, a bouquet daily.

The Russian Superb, blue, 6s. per dozen; the white Russian, same price; with seven other varieties, 3s. per dozen. All free by post. Tripoli Onion Plants, 8d. per 100; free by post. This is a valuable plant; sown in September, they are sure not to run to seed, and they come to perfection early in June, producing abundantly in good soil.—Address, ROBERT SHACKELL, Locksbrook Nursery, Bath.

WARRANTED UNEQUALLED.

ROBERT WHIBLEY is now supplying Selections in Pots, and by Post, from his select Collection of FUCHSIAS. Twelve Varieties, new and distinct, of last year, 10*s.* 6*d.* cash. See List containing a great variety of choice new Plants for one stamp.—Nursery, Kennington, London.

ROSES.

ADAM PAUL AND SON beg to inform their friends and the public in general that they have still a good stock of most of the leading kinds of ROSES, which, when the selection is left to them, they offer on the following advantageous terms:

| | | |
|---|---|---|
| Standard Roses, in 12 superior vars., | 18*s.* to 24*s.* | per doz. |
| Dwarf Standard do. do. | 12*s.* to 18*s.* | ,, |
| Climbing Roses do. | 9*s.* to 12*s.* | ,, |

A priced descriptive Catalogue forwarded on receipt of one postage stamp.

All packages delivered free of carriage to London.

Nurseries, Cheshunt, Herts, March 22.

THE PLANTING SEASON.—WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WM. WOOD AND SON having still on hand a very extensive and superior stock of ROSES, will be happy to supply collections as under (the selection of sorts being left to themselves). The plants are remarkably strong and healthy, and none but first-rate kinds will be sent.

| ROSES. | Per dozen. |
|---|---|
| Extra tall Standards, budded with from 3 to 6 best varieties on a stem ... ... ... ... ... | 42*s.* to 60*s.* |
| Extra superior selected Standards ... ... ... | 18*s.* to 24*s.* |
| Fine Dwarfs and Dwarf Standards ... ... ... | 10*s.* to 16*s.* |
| Superb do. do. (for exhibition) ... | 18*s.* |
| Fine Dwarfs, on own roots, in 50 varieties, per 100 ... | 50*s.* |
| Good do. do. without names, per 100 | 30*s.* |

N.B. A liberal quantity of plants will be given over with each order. Catalogues free on application.

Rose Nippers, of various sizes, for pruning, 2*s.* 6*d.* to 4*s.* each. The Nippers are of an improved shape, being made so as to remove a shoot without bruising the part left; they are highly recommended as a useful addition to the implements of amateurs. Metallic Labels for pot Roses, 2*s.* per 100.

THE BLACK AUSTRIAN PINE,—"PINUS AUSTRIACA."

LUCOMBE, PINCE, AND Co. have a large and healthy stock of this most desirable Pine, exceeding 300,000, from 9 inches to 3 feet high, which having been frequently transplanted, are well rooted and safe to remove; they can offer them, varying according to age and quality, from 20*s.*, 40*s.*, to 60*s.* per 1000. This Pine has been proved to thrive in bleak and exposed places, and in the poorest soils; growing rapidly and producing dense shelter in places where other trees will not grow; it also thrives well close to the sea, resisting the spray and roughest winds.

Exeter Nursery, March 22.

TO GENTLEMEN ENGAGED IN PLANTING.

GEORGE JACKMAN has to offer a large and well-grown Stock of the following at very low prices, which can be had on application.—Beech, 4 to 5 ft.; Chestnut, Spanish, 2 to 3 ft.; Ditto ditto, 3 to 4 ft.; Elms, English, 4 to 5 ft.; Fir, Larch, 2 to 3 ft.; Ditto ditto, 3 to 4 ft.; Ditto, Spruce, 2 to 3 ft.; Ditto ditto, quartered, 4 to 7 ft.; Ditto, Silver, 1 to 3 ft.; Hazel, 2 to 3 ft.; Ditto, 4 to 5 ft.; Hornbeam, 4 to 5 ft.; Oaks, English, 4 to 5 ft.; Ditto, Scarlet, 2 to 3 ft.; Quicks, strong bedded.

Woking Nursery, March 22.

CAMELLIA STOCKS FIT FOR IMMEDIATE WORK.

RENE LANGELIER, Clarendon Nursery, St. Helier, Jersey, begs to inform the Public that he has a very extensive stock of the above, fit for immediate grafting, very clean and healthy, well rooted, so as to leave without the pot, consequently much less expense in conveying to any distant place. Price 36*s.*, 40*s.*, and 50*s.* per 100.

The Stock is such as has never before been offered to the Public by any grower.

R. L. has a most extensive collection of Double Camellias at a very moderate rate and reduced price, as will be seen by a Catalogue recently published, in which it is proved that they can stand the climate out-of-doors without protection. The Catalogue can be had of R. L. by inclosing four penny stamps. Remittance or reference from unknown correspondents

AMERICAN PLANTS.

C. LODDIGES AND SONS, in consequence of part of their Nursery being given up for building, are enabled to offer for cash—

Finest Ghent Azaleas, strong bushy plants named, and being well set with buds, are peculiarly adapted for forcing, 18*s.* per doz.

Azalea pontica, large, 12*s.* per doz.
Andromeda floribunda, 3 to 4 feet across, 10*s.* each.
Vaccinium, 30 species, 12*s.* per doz.
Andromeda Ditto 24*s.* per doz.

Post-office Orders to be made payable at Hackney, near London.

CUCUMBER "PHENOMENA," AND "BROMHAM HALL" MELON.

EDWARD TILEY wishes to inform the Nobility, Clergy, Gentry, and Growers in general, that he has still a Stock of good sound Seeds of the above superb CUCUMBER and MELON, and other varieties, as advertised by him in the *Gardeners' Chronicle*, Feb. 22d, 1851. Cucumber Phenomena, 2*s.* 6*d.* per packet; Bromham Hall Melon, 1*s.* 6*d.* ditto; Fleming's Trentham Hybrid Melon, 1*s.* ditto; and about 20 other good varieties of Cucumbers and Melons, at the prices mentioned in the former Advertisement.

Any quantity will be sent postage free on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath.

VERBENAS.—A Set of Twelve of the most extraordinary Seedling Verbenas ever offered. As a proof of their excellence, they have been awarded 30 first-class certificates; three of them will be figured in the "Gardener's Magazine of Botany," April 1. G. S. begs to say that they are very distinct, and far surpass any previously raised. The set in strong plants, the third week in April, at 2*l.*, or 5*s.* per plant. For descriptions, see Catalogue, which will be forwarded on the receipt of one postage stamp, with the description of the beautiful Fuchsia Sedonia, figured in the "Gardener's Magazine of Botany," for March. Also his new Petunias and Heliotropes. Selections, with prices of Verbenas, Fuchsias, Dahlias, Chrysanthemums, Geraniums, &c., at moderate prices.—GEORGE SMITH, Tollington Nursery, Hornsey-road, Islington, London.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, March 22.

PLANTS! PLANTS! PLANTS! NEW AND CHEAP.

H. WALTON begs to offer the following at the very low prices named. DAHLIAS of 1850, 9*s.* and 12*s.* per dozen; older varieties, 4*s.* 6*d.* to 6*s.* per dozen. FUCHSIAS, new varieties, 20 for 18*s.*, 12 for 12*s.*, 6 for 7*s.*; older varieties, 5*s.* per dozen. VERBENAS of 1850, 1*s.* each, or 6*s.* per dozen; older varieties, 3*s.* to 4*s.* 6*d.* per dozen. PETUNIAS of 1850, 9*s.* to 12*s.* per dozen; older varieties, 6*s.* per dozen. 12 of the choicest PANSIES of 1850, 16*s.*, or 24 for 1*l.*; older varieties, 6*s.* to 9*s.* per dozen. CINERARIAS, sent out last spring, 9*s.* to 12*s.* per dozen. GERANIUMS, 7*s.* 6*d.* to 12*s.* per dozen. 12 first-rate Show CARNATIONS, 9*s.* to 12*s.*; 12 first-rate Show PICOTEES, 9*s.* to 12*s.*; 12 first-rate Show PINKS, 4*s.* to 6*s.* Named CHRYSANTHEMUMS, 6*s.* per dozen.

For particulars of the above see Catalogues, which may be had by enclosing one stamp. Strong, healthy, well rooted plants, may be depended on; securely packed, so as to ensure the safe delivery of all orders at the least possible expense.

It is respectfully requested that all orders be accompanied with a post-office order, made payable at Marsden, in Lancashire.

HENRY WALTON, Florist, Edge End, Marsden, near Burnley, Lancashire.

HUGH LOW AND CO. beg to offer established Plants of the undernamed:

| | |
|---|---|
| PHLOX, 24 superior sorts, each ... ... ... | 1*s.* 0*d.* |
| ,, 24 newer varieties, each ... ... ... | 1 6 |
| ,, 12 best Belgian varieties of last year, each | 2 6 |
| CHRYSANTHEMUMS, in great variety, per doz.... | 9 0 |
| ,, per 100, one plant of each sort ... ... ... | 50 0 |
| ,, newer varieties, per doz.... | 18 0 |

LILIPUTIAN CHRYSANTHEMUMS.—These miniature varieties have, during the past season, established themselves as great favourites, on account of their dwarf habit and profuse blooming.

12 varieties of 1849, 1*s.* each, or 9*s.* per dozen.
18 ,, of 1850, 2*s.* each, or 18*s.* per dozen.
GLOXINIAS, 6 fine Continental hybrids, 2*s.* 6*d.* each.
BLUE MIMULUS (Mimulus ringens), a fine hardy herbaceous plant, 2*s.* 6*d.* each.

A few fine round-headed SWEET ORANGE TREES, 2 feet stems, full of fruit, 15*s.* each.

Post-office orders payable at Hackney.

Clapton Nursery, London.

VALUABLE VEGETABLES.—CAULIFLOWERS.—Myatt's improved early, much earlier than the old varieties, more compact and heavier, considered by the raiser as most desirable, quantity very limited, 1*s.* packets.

BRUSSELS SPROUTS, improved variety, direct from Brussels; 1*s.* per oz., 6*d.* per packet.

CABBAGE, MITCHELL'S ENFIELD.—This has been tried at the Horticultural Society's Garden, and pronounced one of the best; 1*s.* per oz., 6*d.* per packet.

CABBAGE, CHAPPEL'S COLEWORT, excellent for Winter Greens; 6*d.* per oz.

CARROT, ST. JAMES', one of the best for small gardens, and shallow or heavy soils; 3*d.* per oz.

CELERY, COLES' SUPERB RED, very extensively grown last season, and pronounced first-rate; 1*s.* per oz., 6*d.* per packet.

LETTUCE, VICTORIA CABBAGE, but little known, but one of the handsomest grown, and which no gentleman's garden should be without.

DUNCAN HAIES, in offering the above selection from his general List, begs to inform his friends that he warrants them to be as described.

109, St. Martin's-lane, Charing-cross, London.

MESSRS. HAY, SANGSTER, AND CO. will be ready to supply their prepared POTATO CUTTINGS about the middle of April next, the produce of which proved so highly satisfactory last, as well as the experimental trials of the three former years, as to QUALITY, QUANTITY, and SIZE, being more than double the crop this year of those planted in the usual way, and containing a much larger quantity of starch, which is so essentially necessary to the preservation of that valuable root. A report of the analysis will be found below. Our own experiments give about one-third more saccharine matter than the best we could procure grown under the old system. All orders must be to hand on or before the end of the second week in April, as H. S. and Co. are preparing to plant a large breadth, and will only provide for what may be ordered up to that time. Post-office orders to be made payable to JOHN SANGSTER, at the Borough Post-office, Southwark. Printed instructions for planting and management will be sent with the plants ordered.

| SATURDAY, | — 29 | Medical | 8 P.M. |

IT is quite remarkable to observe, how much has been written, and yet how little is really known, respecting the THEORY OF TRANSPLANTING, a subject of the first importance to the working gardener; in some cases, a good deal of sound knowledge, and good practical experience, is so overlaid with fine words and absurd affectation of science, that the seeker after instruction has no easy task to separate the sense of the author from his nonsense. In other cases, that which is altogether false, and without any real value whatever, is stated as unquestioned facts, and is told with such an air of decision and authority, that it may easily deceive those who are not aware of the true weight to be attached to such authority, and the real value of such facts. It is to be regretted that there is hardly any really good book especially devoted to this subject; it is probable that if there were, we should not so frequently observe the evil effects of ignorant and careless planting in plantations and woods, as we do at present.

There are many hundred thousands of acres of land in various parts of England perfectly barren and useless, and, consequently, of little or no real value to their possessors, but which, if judiciously planted, might, in time, be rendered profitable in various ways. We have sometimes suggested to the possessors of such tracts of land, the advantage of planting with suitable trees some of these waste lands, and have not unfrequently been told, in reply, that it was quite useless to do so, because nothing would grow there; the place was too exposed, too high or too low, too wet or too dry; and in support of this, the failure of some attempt to plant a neighbouring piece of ground was adduced. Now, in nine cases out of ten of this sort, it will be found, on closely inquiring into the matter, that the failure of the neighbouring plantation has arisen from the miserable and careless mode in which the planting has been effected. The work was, perhaps, done by contract, the trees were bought as cheap as possible, fetched from a distance, and badly packed, so that they received as much injury as possible on the road, short of absolute destruction. In planting, it is probable that nothing more was done than to make holes in the ground, or rather slits, with a single cut of a spade or pick, the trees thrust in, and rammed hard, to prevent them from being blown away, generally being buried a few inches deeper than they ought to be. Of such planting we can only say, that if the roots of the plant chance to be put into the ground—in fact, if the tree is planted with the right end upwards, it may possibly grow. No one need wonder if the greater number die, whilst those which do grow look starved and miserable, and at last, if they live long enough, form something between a bush and a stunted tree; in short, it is more wonderful that any of the trees thus planted grow at all. Let it not be thought that we are too severe in making these remarks; we are unfortunately not speaking of one case, but of many, as any one may learn, if he sets out on a journey to discover badly managed plantations.

We doubt very much whether there is any great quantity of land in England on which trees of one sort or other might not be profitably cultivated. Of course there are situations, as, for example, on the sea-coast, and exposed to the influence of high tides; and again, in certain rocky districts, where there is, perhaps, no true soil, in which plants could not grow, but, with the exception of these and similar cases, there are but few instances of barren land which, by a little care and attention, might not be in a few years covered with healthy trees. As, on the one hand, we could point to numerous instances of the failure of bad planting in barren or exposed situations; so, on the other hand, we might mention many cases in which, by the expenditure of a little more care and money, the most successful results have been obtained. In planting barren land, the various conditions of situation, exposure, and soil, must be considered; and if there is any thing which is evidently wanting, or unfit, it must, if possible, be remedied at once. The depth of the soil, and the nature of the subsoil, must be inquired into. The superabundance of water must be guarded against; and at the same time it must be borne in mind, that it is quite possible to over-drain land; especially that which is very light and porous, and which, therefore, soon becomes dry and scorched in a hot summer. Above all things, some pains must be taken in planting the trees themselves; they must be selected according to the situation to be planted, and they must be carefully planted in the soil when it has been properly prepared, and not merely stuck in holes and the earth rammed hard round them, as if they were so many hedge-stakes.

In exposed situations, as in bleak downs by the sea shore, it is often found that nothing but some hardy Pine, or similar tree, is able to withstand the wind; but even in these cases, by planting in belts, and by making use of the shelter which the more hardy trees afford, it is easy in a few years to have thriving plantations of most of the ordinary forest trees. The value of shelter is strongly insisted on by all who have had the management of plantations by the sea shore, and it may be readily seen, by observing the outer trees of exposed woods, and comparing them with similar trees which have

grown up in less exposed situations. It is not enough in planting waste ground, to break up the surface once, and leave the young trees to struggle up through a dense mass of tangled weeds. Young trees are often thus absolutely smothered; yet the cost of once or twice going over the ground again is in all cases amply repaid, by the increased growth and vigour which the young trees derive from that operation. When weeds are permitted to grow thickly round young trees, they prevent the latter from growing, and absorb those matters which would otherwise form the food of the young trees.

There are no doubt places in which all the skill of the planter will at first fail in getting trees to grow, but even in such cases he need not despair; the cause of his failure usually is, not that the soil is absolutely unfit to support vegetation of any kind, but that the circumstances being highly unfavourable, the plants are not able to get over that shock to their systems which they always suffer in ordinary transplanting. It is evident that plants which are moved with bare roots, as young trees are, must receive a far greater check than those which are moved with a ball of earth; and it is very often found that a little extra care in the planting is well repaid, because if the tree survive this check, and form fresh roots, it will generally get such a hold upon the soil, that it is then able to grow up, and form a healthy tree. In planting the most barren and exposed situations then, particular care must be taken, and it appears in such cases to be well worth while to add some "improver" to the soil, thrown into the holes in which the trees are planted. The quantity required is small, its cost need not be great, and the labour of using it is a trifle, compared with the good effect produced by its application.

The effect which it is desired to produce is the formation of fresh roots, and any substance which will cause the plant to throw out a quantity of fibrous rootlets, will enable it to overcome the evil effects of its being transplanted. It appears that phosphoric acid possesses a very great and remarkable influence on the development of roots, causing plants to throw them out with unusual vigour; we do not know of any very satisfactory explanation of this phenomenon, either chemical or physiological, but of the fact itself there seems to be no doubt. The most convenient mode of employing this substance is in the form of superphosphate of lime, as it is called, that is to say, a mixture of oil of vitriol and burnt bones. This compound, which is rich in phosphoric acid in a soluble state, may be readily mixed with a little dry mould, and it then forms a most valuable aid to the planter; a little of the mixture being thrown in round the roots of the transplanted tree, aids greatly in the formation of root fibres, and consequently assists very much in establishing the plant in its new situation. Or, if scattered over the soil next the roots, before it is finally watered after planting, it is well distributed to the places where it is most required.

When a young tree has its roots thrust into such a hole as is made by a single cut of a spade, or even by two cross cuts, the roots are crowded together, and crushed into a small space; they are unfitted therefore to collect and absorb nourishment, at a time when the plant stands peculiarly in need of it. Not only is the freshly-planted tree able to obtain little food by means of its roots, in consequence of the mode in which it is planted, but the supply of nourishment is at the same time also diminished in consequence of the change of soil. In all cases the soil of the nursery or seed plantations, having been repeatedly dug over, and more or less manured, is better suited to the growth of the young plants than the soil into which they are transplanted can possibly be. When a plant is moved from one soil to another its growth is always checked, and the first step which it makes towards repairing the evil thus caused, is the formation of fresh roots; by bad planting this is made as difficult as possible to the plant.

It is hardly fair to compare together the growth of trees with that of the ordinary vegetables which are cultivated in our kitchen gardens; of course the conditions necessary to the growth of an annual, differ from those proper to the healthy development of a slow growing tree, which requires a long series of years to arrive at maturity; but even in the case of common garden crops, the same general effects to which we have just referred, may be observed. In almost every case where it is desirable to increase the development of roots, phosphoric acid is of the greatest value. When we wish to force young plants, to push them forward as fast as possible, so that their roots may get some hold upon the soil, the superphosphate of lime is one of the best manures we can employ. The mode in which that substance brings forward a crop of Turnips is an illustration of this, and the remarkable way in which it assists the growth of the young plants, getting them rapidly into the rough leaf, and producing a more marked influence on their growth then, than it does at any subsequent period, appears to depend chiefly on the fact that it aids them in the formation and development of roots.

Superphosphate of lime is, therefore, a very valuable fertiliser in the hands of the planter, but in using it he must always remember, that as his plants must necessarily absorb the whole or the greater part of the soluble manure which he gives them, he must take care not to give them too much. He must not suppose that if one handful will do good, therefore ten handfuls will do more: it is very easy to give too much, and plants, like animals, may equally be injured by over feeding or by starvation.

## GRAFTING.

No. XII. BUDDING WITH PUSHING EYES: figs. 15, 16, 17, and 18. (*Greffe en écusson à œil poussant.*)—In temperate and cold countries, this operation ought to be performed during the first rise of the sap; for by deferring much longer the shoots springing from the inserted buds will be in danger of not being sufficiently matured for withstanding the frost: besides, this practice has the effect of weakening the stocks, by depriving them of a large quantity of foliage which they will then have acquired, it being necessary to cut back the stocks an inch or so above the bud, in order that it may be induced to push immediately after its insertion, and care must always be taken that the portion of stock left above be furnished with one or two shoots or leaves. The object of leaving this small piece of stem is to attract and concentrate the sap for the benefit of the bud. For the better fulfilling this, and for preventing the inconveniences above pointed out, they now do not immediately cut off the shoots from the stock; instead of doing so they bend them into the form of a huntsman's horn, and keep them in that state till the buds have fairly commenced to push, and then they cut them back to within about one-eighth of an inch of the bud. This operation, although less injurious than the preceding, causes the privation of a great quantity of foliage at the time when the trees are most in want of it, for protection against the excessive heat and drought, which is almost certain to occur, at that period of the season; and the consequence is that the vigour of the tree is suddenly checked; and nothing but abundant waterings can possibly re-establish it. This mode of budding is only used for a few kinds of trees and shrubs; among the latter, Roses are more especially included, the species or varieties called Hybrid Perpetuals (Remontantes), and Bengals being worked in this way; but those amateurs who find themselves under the necessity of practising it, and who wish to maintain the vigour of their stocks, make a point of preserving as many leaves as possible, and bud only the strong shoots and branches; and with regard to the weak, they only cut them back when the inserted buds are in a good state of vegetation.

Fig. 18 Fig. 17. Fig. 15.

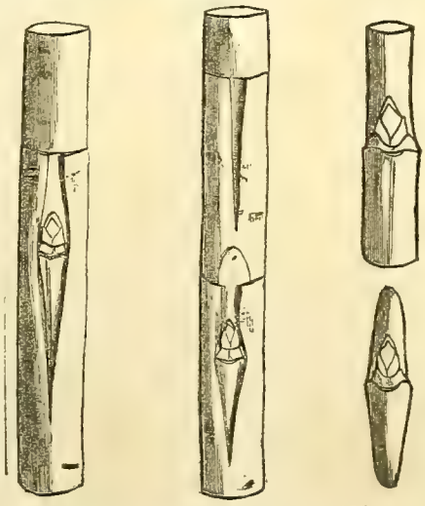

Fig. 16.

There are also some fruit trees which we cannot bud by this mode before the leaves make their appearance, such as the Mulberry, Walnut, Chestnut, &c.; but in order to succeed well with these, it is necessary to take buds from the two-year-old wood; and in this case the branches had better be cut off in March, and preserved as has been directed for the shoots intended for cleft grafting. When the vegetation of the stocks destined for the reception of these buds shall have become decidedly active, the branches should be taken from their entrenchment, washed without much rubbing, then wrapped in a damp cloth and placed from 30 to 40 hours in a moist atmosphere of between 60° and 77° F., in order to expand their latent sap, so as to render it possible to detach their bark from the alburnum without laceration.

This state of the sap, almost indispensable for the proper raising of the buds, is also necessary for the budding performed later; but whatever may be the season, the buds are removed as follows:—With the blade of the grafting knife, we cut the shoot obliquely (see Fig. 15); then we place the blade about three-quarters of an inch above the eye, for the purpose of raising it, accompanied with a large slice of bark; in order to facilitate this operation we make the blade descend, sloping towards the eye, cutting through the bark, and a small portion of the alburnum. The blade should preserve the same slope for passing under the eye, and continuing its course till it meets the first cut. This eye, furnished with its two appendages, should be keenly examined when turned up; and for this examination, as well as for everything else requiring to be done before placing it in the stock, we take it lightly between the fingers of the left hand, and with one of these we gently bend down the portion of bark placed above the *corculum*;* then by means of the thumb of the right hand, and the blade of the grafting knife, placed in the same hand, we can take hold of the alburnum above the point, and remove it; but this removal should not extend beyond the *corculum*, which ought to be preserved entire. If in consequence of not being well habituated in raising the eye, the patch of alburnum is too thick (and this we shall always know to be the case when it brings the eye along with it), we must thin the whole, in order that it may separate without tearing out that essential part. Then, in front of the stock, with reference to the place where it is to be planted, proceed as follows: With the blade of the grafting knife make a horizontal incision, which shall embrace almost one-third of the stock, cutting through the bark as far as the alburnum; another incision to the same depth should be made downwards and perpendicular to the first, the two representing the letter T; then slightly raise the bark at the circular cut, taking care that in doing so the handle of the budding knife does not bruise the *cambium*.†

Thus prepared, as seen at fig. 17, the bud should be introduced under the two lips of the cut, then only partially opened, for it is generally by the bud being pushed and gently pressed in by the thin part of the handle of the budding knife, and in conjunction with it, that the opening is sufficiently effected. When the bud is perfectly fitted at the base, and placed as is represented, the portion of bark which extends above the transverse line is cut off. This operation is represented by fig. 18. The two lips are then brought towards each other, and fixed over the bark appertaining to the bud, by means of a ligature, generally of woollen or thick cotton thread; the length of this thread being proportioned to the thickness of the stock; two-thirds of the length should be kept in reserve in the right hand, the rest at the disposal of the left. Thus divided, we place it opposite the bud, and draw the two ends with a moderate force, crossing them above the bud, and as close to it as possible, without covering it. Two or three other turns should be made in the same manner. With regard to the finishing of the ligature, of which the object is to cover the rest of the wound, it will be sufficient to wind the thread continuously in the same direction, nd finally secure it by a half-knot. When the stocks are extremely vigorous, it is prudent to inspect the ligatures soon after their application, and to loosen them occasionally, in order to preserve the buds from being strangled. When the bud shall have completely taken, the ligature may be removed; and we then take care to cut off all shoots springing from the stock below the bud, in order that the latter may appropriate the whole of the sap.

*Translated from the French of D'Albret.*

## VILLA AND SUBURBAN GARDENING.

PLANTS under glass, whether in houses or hand-glasses, require a constant supply of fresh air. Although the importance of this has been often pointed out, the practice is frequently neglected, cultivators of Pelargoniums for market excite the temperature considerably by night, but during the day, in mild weather, their houses are thrown open as much as they possibly can be. Those who grow early Cauliflowers for market, never neglect on all favourable occasions to tilt or totally remove the gland-glasses which cover them. If this were not done, the plants, although excited by no artificial means, would become drawn and feeble. Amateur gardeners always complain that their plants become lanky, and that they are unlike those to be seen, even on the heads of hawkers about town. They therefore consider that there must be some secret in the mode of cultivating them, which they have not yet discovered. Since the introduction of sheet glass, larger panes are used, and hence the necessity of providing for the admission of a corresponding amount of air, which would, under the system of small pane glazing, have found its way through the laps. It therefore becomes a matter worth consideration in the erection of houses for plants, to provide ample ventilation. It can be used or not, according as it may be required. The heating apparatus is generally the subject of most attention, the ventilation rarely receives much consideration, but the former may, in many cases, be entirely dispensed with, while we cannot do without the latter; so essential to success do some of our best gardeners consider fresh air, that during summer and winter, both night and day, a constant stream is admitted to plants even requiring a tropical temperature. Contrivances have also been adopted for supplying the roots of Grape Vines and other plants with air. In modern gardening structures, the means of obtaining light have been chiefly aimed at.

* A scientific name, for which I am inclined to substitute that of root, seeing that this small fleshy body, already fibrous and half-woody, is attached to the germ, eye, or vital point, which cannot, without its assistance, implant itself in the stock.

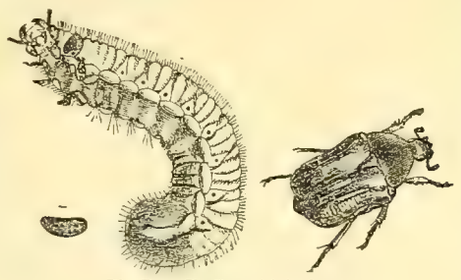
† A gummy semi-crystallised substance, which exists under the bark, and remains attached to the alburnum.

This is exemplified in numerous large iron stoves and greenhouses, which have proved useless for the well-being of plants, on account of the limited amount of ventilation usually provided in such buildings. In consequence of the reduction of price in all the materials employed in erections for the growth of plants, it cannot be out of place here to draw the attention of amateurs to this matter; for understanding as they do very little about the subject, they should insist on abundant means of admitting air being provided; unless provision for this is made when the buildings are first erected, considerable difficulty is often experienced in their working, and much extra expense is frequently incurred, which might, with a little forethought, have been obviated. Any mode adopted in ventilating hothouses incurs expense, beyond the mere glass frame work. I would, therefore, caution amateurs against being seduced by cheap greenhouses. *Pharo.*

## WHAT IS AN INSECT?

We must now confine our attention to those animals which are destitute of an internal back-bone, and have the body divided into a series of joints, with a nervous system consisting of a double thread united at certain distances by knots or ganglions.

Amongst these animals a first division consists of such species as are, throughout their whole lives, destitute of jointed legs, with the body, in the majority, soft, more or less elongated, and always divided into a great number of rings (whence the division is named Annelida, from the latin *annellus*, a little ring). The first segment of the body, or the head, scarcely differs from the rest, except in bearing the parts of the mouth and other organs of the senses, and the blood is generally of a red colour. Nearly all these Annelidans live in water, some burrowing in the sand or other matters at the bottom, or else constructing a tubular calcareous case within which they reside, and of which the material is emitted from their own bodies. The earth-worm and the leech are two of the best known examples of this great division, of which the number of marine species is considerable; of the latter, the sea-mouse (Aphrodita aculeata), is remarkable for the numerous bundles of sharp-pointed bristles and soft silken hairs on its back, exhibiting the most brilliant metallic tints. Although, however, it is the chief character of this division to be destitute of jointed legs, it does not, therefore, follow that all legless articulated animals are Annelidans; the nut-grub, the cheese-hopper, the bee-maggot, and very many other real insects are destitute of legs in their young state, although these organs are subsequently fully developed. So also there are a few insects which even in the perfect state are destitute of legs, but in their young state they possessed those organs. Such are the females of the scale insects and the female stylops; the males, however, of these insects are furnished with fully developed legs. Hence it is not easy at first to distinguish between a real Annelidan and the worm-like young states of some insects; and, indeed, one of the latter has been mistaken by one of our best British naturalists for an Annelidan, and described as a new genus belonging to that division. Had the examination of such an animal been continued, it would have been ascertained that it subsequently underwent a series of transformations, by which not only legs but wings also were produced.

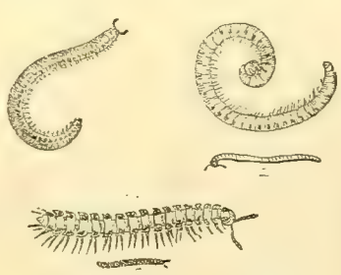


We have now, therefore, found that the presence of jointed legs at some period of its existence forms a further limitation to our inquiry—What is an insect?

The animals which possess this character of articulated legs have indeed been considered by some writers, including Linnæus himself, as constituting a distinct class, to the whole of which he applied the name insecta, but although a lobster or a centipede is as truly insected, that is, divided into segments, as the wasp or the beetle, the ordinary idea of the word insect rejects them from this class. Let us then endeavour to discover what is the popular idea of an insect.

In the "New World of English Words," a scientific dictionary published in 1658, we find "insect" defined as "the smallest sort of animal, as a fly, bee, or ant; some think them to be so called, because they have a kind of division or section between the head and the belly." Dr. Johnson, in his Dictionary, gives two quotations in illustration of the word insect; one from Thomson, namely, "anything small or contemptible;" and the other from Locke—"Insects are so called from a separation in the middle of their bodies, whereby they are cut into two parts, which are joined together by a small ligature, as we see in the wasps and common flies." It is quite evident from these definitions that no precise idea attaches itself to the word in a popular point of view, for as to the small size of insects, many species are larger than some birds or even quadrupeds; and as to the separation in the middle of the body there are thousands of real insects, and indeed entire orders, which have the body continuous; besides, the term implies not only an animal with a deep incision in the middle, but also a series of notches along the whole length of its body. We must therefore fall back upon the scientific characters of the different groups of articulated animals provided with jointed legs, in order to determine the precise divisions to which the term insect belongs, as well as its limits.

Now every one admits the bee, fly, beetle, and butterfly to be insects, all of which agree in possessing the following characters.

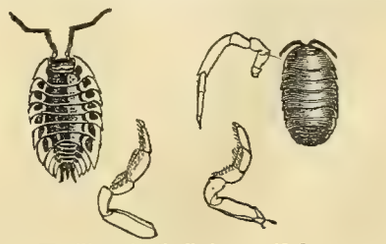


Articulated animals breathing by means of a series of breathing pores along each side of the body, running into longitudinal tubes, having the head distinct, bearing two jointed appendages called antennæ; furnished in the perfect, and generally in the early states, with six jointed legs, and subject to a series of moultings, previously to arriving at perfection, whereby wings are ordinarily developed.

The Rose Chaffer, with its larva.

These characters (making due allowance for the few exceptions which are found against one or other of them) define an immense group of animals which are at once distinguished from all the rest of the Invertebrates by possessing organs of flight, and in which, as Professor Owen observes, "the highest problem of animal mechanics is solved, and the entire body and its appendages can be lifted from the ground, and be propelled through the air." It will, however, be observed that I have purposely modified the last character, in order to include amongst the true insects two groups of small extent which do not acquire wings, namely, the six-legged spring-tailed insects (Thysanura) and the lice (Anoplura), which are rejected by those authors who consider the possession of wings as the grand characteristic of insects.

The articulated animals which possess more than six jointed legs in the perfect state, but which are destitute of wings, are very varied in their structure; and instead of forming, with the spring-tails and lice, a single order, Aptera, as in the arrangement of Linnæus, it has been found necessary, now that their internal anatomy has been more thoroughly investigated, to divide them into three different classes, the first of which (and occasionally a portion of the second) have been regarded by some authors as properly referable to the same group as the winged insects, on account of the similarity in their respiratory apparatus. If, however, we do not restrict the term insect to the winged, or at all events to the six-legged species, I consider that we ought to follow Linnæus, and extend it to the whole of the Invertebrates with jointed legs. These three wingless classes are:



Various species of Snake Millepedes.

1. Myriapoda; comprising the centipedes and millipedes, distinguished by an elongated body formed of a great number of segments, a distinct head bearing two antennæ, a great number of jointed legs, extending the whole length of the body, respiring by two principal tracheæ or lateral air-tubes, and numerous breathing pores, and with the eyes composed of a number of small separate globules.

Garden Mites, natural size, and magnified.

2. Arachnida; consisting of spiders, scorpions, mites, &c., all of which possess in the perfect state four pairs of legs, the head not distinct from the body, and not provided with antennæ, or compound eyes, respiring by air sacs or lungs; the mouth generally furnished with a pair of leg-like instruments, varying considerably in size, and forming a large pair of claws in the scorpions.

Woodlice, with the limbs magnified.

3. Crustacea; composed of the crabs, lobsters, shrimps, &c., characterised by having the head generally confounded with the thorax, furnished with antennæ, respiring by gills, placed at the sides of the body, furnished with five pairs of legs in the more conspicuous species, the fore pair forming large claws; the mouth, consisting of a number of pairs of lateral jaws, two pairs of which, in the shore-fleas (Amphipoda) and wood and fish-lice (Isopoda) are so much enlarged as to act as two additional pairs of legs. The common wood-lice are instances of this seven-legged division, which approach the nearest to our ordinary notions of real insects.

The characters which we have laid down above, refer in general to the perfect state of the different animals; but the winged insects undergo a most remarkable series of transformations, and in the earlier stages it is not easy at once to determine whether some of them are insects or not. Our next paper will therefore be devoted to the subject of insect transformations. *J. O. W.*

## BRITISH SONG BIRDS.

(Cage Birds, No. 6.*)

No. XXII. As many inexperienced persons meet with repeated vexations, either in losing their young birds when hatched, or in having the eggs forsaken by the parent birds, during the process of incubation, I will very plainly show the reason, and provide the remedy.

Any person who will take the trouble of thinking, and reasoning on the subject, must be struck with the folly generally exhibited in putting up birds to breed from, themselves only a year old! That the hens do lay, and that their eggs are sometimes fruitful, I grant; but the giddiness of the parents, their inattention to their young, and want of experience generally,—are constant causes of their first and second broods dying in their infancy.

No birds should be paired until they are at least two years old. From that period they may be said to be in full vigour, and instinctively qualified for the perpetuation of their race. You will find the hens, at this age, less fickle in their attachments, and more devotedly affectionate to the husband of their choice. There will be but one common feeling between them; they will share jointly the solicitude attendant on the hatching and rearing of a family, and the male will be constant in feeding his partner as she sits on the nest. All these points are essentially to be regarded.

The next consideration will be, how to breed your birds perfectly pure. Having once procured a good "stock," your anxiety for the future will be removed. If you wish to have birds of a brilliant or "gay" plumage, let both parents be of a clear and uniform yellow, free from all foul feathers. If any be visible, the breed will be *im*pure. If you select a Belgian canary, let it be a Jonque *male* bird only, and associate with him a Norwich or a Yorkshire hen. The Belgian hens, although good mothers, are yet of so large and so long a body, that they sit awkwardly upon the nest, and find great difficulty in hatching their eggs. This remark applies, however, more particularly to a breeding-cage. If the birds are in a room, and build in a tree, the objection I make will be over-ruled.

Such persons as are not particular with regard to colour, will find that the grey canaries breed as well, or perhaps better than most others. They are assuredly the best nurses. But whatever colour you choose, take special care to select birds of the largest and longest feathers you can get, and let them be in robust health. A sickly parent, father or mother, will produce a puny, degenerate offspring. In selecting a pair of English canaries, let the hen be the larger of the two, so that her eggs may be the better covered. The heat imparted from the body of the mother, is twice as great as that from the father.

When a pair of canaries have the misfortune to "addle" their first nest of eggs, which, notwithstanding great attention on their part, will sometimes be the case, you will find it will teach them a practical lesson. They will speedily go to nest a second time, and most probably hatch every egg, and rear every one of their offspring. *Some* males are steady, and good to breed from, when a year old; but the hens should *never* be put up until in their second or third year.

The late Sir John Sebright, in a pamphlet on the "Instinct of Animals," maintains that "acquired habits in animals become hereditary." I incline strongly to the same opinion. Long experience goes far to confirm its truth. If this be the case—and why not?—when you observe any bird of a particularly quiet and amiable disposition, set him aside; and provide him a mate in whom are observable equally good qualities. I can call to mind several instances, in which I have witnessed good results from this course of action. I cannot go so far as to say, that I think a bird's *vocal* powers are hereditary. That is purely apocryphal. In all other points, the doctrine holds good. It is a great object gained, to have lively, healthy, good-tempered, well-formed, and handsomely-feathered birds; and I advise that, under no circumstances, should canaries be put up

* I am urgently entreated, to let the *soft-billed* birds follow next in order, after the "Canary;" reserving my remarks on the rest of the family of *hard-billed* birds until the former shall have been fully disposed of. The request is reasonable; and it arises from the fact of the migratory birds being about to revisit us in a few weeks, as well as from a generally-entertained wish to know their habits, and proper mode of treatment on their arrival. Be it so. That king of song, that harbinger of spring—*the Nightingale*, shall herald in "No. 12," to appear *May 3rd.*

for breeding that are melancholy, heavy, or mopish. Sprightliness, vivacity, and joyous energy, should be the prevailing characteristics in every *good* bird.

Fancy birds, so called, are attended with much trouble in rearing, and also much disappointment. I will briefly indicate the intrinsic merits of a prize-bird, many of which are exhibited at private "clubs" in London, and the provinces, once or more yearly. I would observe, that the *plumage* of these birds is the grand desideratum, their song being a minor consideration.

A good fancy bird must have a clean cap; that is, the crown of his head, defined by a horizontal line at the level of his eyes and beak, must be of a clean yellow or white,—in no respect broken or spotted with foul feathers. One single foul feather renders him imperfect; though it is right to acknowledge, that such extreme purity is rarely met with. His back, wings, and tail, must also be equally free from yellow or white feathers. To make his beauty remarkable, he should be finely mottled on the back, and of a fine clear yellow all below the breast.

These requirements are as essential in a hen as in the male bird. There are two names given, to distinguish the colour by. The one are called "mealy;" the others Jonque birds. The former have their crowns, and all below their breasts, of a clean white or *pale* yellow; the latter, of a *deep* yellow. No good breeder ever pairs two mealy and two Jonque birds together. A skilful eye would immediately detect any offspring resulting from such a union.

Male birds, finely spangled, as those I allude to, should be paired with a "mealy" hen,—for this reason; the young of all birds mostly take after the father in their feathers. Many of my readers will smile, when I tell them that it is a practice to have a pattern bird, drawn on card-board and highly coloured, which is regarded as a specimen to breed by. Any failure in coming up to the "standard," causes a breeder infinite chagrin!

Before quitting this subject, I would remark that, however first-rate fancy birds may be, no entire dependence can be placed on their offspring being equally perfect. Blemishes, of some kind, frequently appear. On the other hand, two birds, of little comparative value, often produce a very fine breed. It is amusing to watch the proprietors of these prize birds, after the "public annual exhibition" of them is over. Every bird has his cage enclosed in an air-tight bag, and is carried away with as much mystery as was formerly attached to the Delphic Oracle. Their mistresses appear to have more to do with them even than their masters; and convey them away with the most solemn pomp of circumstance.

I have already remarked, that these forced birds are valuable for their "beauty" *only*. They are the sport of every breath of air; and, like hothouse plants, must be vigilantly tended or they die. Nature shakes her head at such doings, and approveth them not. So do I, being a humble follower in her ladyship's train. In the matter of a cage bird,—give ME *Vox—si præterea nihil! William Kidd, New Road, Hammersmith.*

[P.S. May I, without offence, give my "private" correspondents a gentle hint? Although, when their birds are ill, I am at all times most willing to furnish "advice gratis,"—yet the "*fee* simple" of *a postage stamp* should always accompany every question asked. This, on the principle of what the lawyers call receiving "costs out of pocket." Homœopathic though a penny be, yet is my weekly correspondence, in the aggregate, something more palpable to the touch. I again repeat—EVERY *song* bird will have ample justice done it, in the columns of the *Gardeners' Chronicle*; but "*Patience* must have her perfect work." *W. K.*]

## Home Correspondence.

*Spring Flowers.*—I observe that the attention of your correspondents is attracted to the culture of that delightful little spring flower the Hepatica. I would ask you to say whether you do not consider that failure in the growth of this plant is not often occasioned by the crown of the plant being buried in the soil. Whilst on this subject I would take the liberty of calling the attention of your readers to a bulb which does not seem to be much known, viz., Corbularia (Narcissus) tenuifolius, and which I think decidedly superior to C. bulbocodium, from its earlier period of bloom and hardiness. I have had it in flower in the open border for nearly a month past, and the bed is now quite a picture; it is a fit companion for the charming Trichonema bulbocodium, a perfectly hardy bulb, now finely in bloom in a bed adjoining the Corbularia. *Rusticus.*

*The Bouquet Trade in New York* (*see p.* 150).—Your correspondent "C. B. D." has called in question the correctness of my friend's statement respecting the bouquet trade in New York. Never having been there myself, I cannot, of course, speak as to the number or capabilities of the nurseries and greenhouses in that city. It is not stated, however, that the flowers used on New-year's morning were all from one greenhouse, or from one establishment; indeed, in a former communication, my friend mentions that the inhabitants of New York spend annually a very considerable sum in the purchase of cut flowers. People seldom tell untruths gratuitously, and, as my correspondent could have no object whatever in deceiving me as to the amount of business done by his employer, I can have no doubt of the correctness of what he states. The letter was a private one, and my young friend could not have the most remote idea that any part of it would appear in print. My object in sending an extract to the *Gardeners' Chronicle* was partly to show the growing taste for flowers—the somewhat primitive New Year's-day customs of our friends in the good city of New York—and the novel application of an air-tight metallic case, which, if it fulfils the expectations of the inventor, will enable us to obtain a bouquet from the Himalayas, or New Zealand, as fresh as if gathered from our own garden only yesterday. *J. Little, Langholm.*

*Out-door Treatment of Nymphæa cærulea.*—During the summer of 1849 my plant, a seedling, was planted in a tub, and placed about 10 inches beneath the surface of the water in an uncovered tank. It withstood the severity of the following winter, and made fresh leaves next May. Last year it grew luxuriantly, but did not flower. It lost its leaves from frost last October. I examined it yesterday; the caudex is quite plump and healthy, and I expect it to flower this season. It must be borne in mind, however, that the tank in which it grows occupies a semicircular recess, and is screened from the north, east, and west by a wall 12 feet in height. A terrace walk passes the front of the recess which is open to the south. It will be seen, therefore, that the plant has a favourable situation. In the same tank I have also Limnocharis Humboldtii, Agapanthus umbellatus, Villarsia nymphæoides, Aponogeton distachyon, Calla æthiopica, Mimulus rivularis, Acorus Calamus, and the white and yellow Water Lilies. All these flourish satisfactorily. A thermometer whose bulb rested on the tub indicated 38° when ice an inch thick covered the surface. I placed it in the same situation this morning, and it registered 41°. My supply of water is by no means constant, the crown of the plant being sometimes no more than 3 inches below the surface; but the depth at which such plants should be placed is best regulated by the length of the leaf-stalks. I consider 10 inches a very good depth. I should like to try many of our stove aquatics out of doors, more especially Victoria Regia. I imagine that they are in reality not half so tender as people expect. An aquatic is not subjected to extreme heats and colds, like a common plant; the temperature of the water being more uniform than that of the air. *Edward Morse, Albury Park, March* 8.

*The Spanish Chestnut.*—I am desirous of inquiring of those who have had any experience in the quality of Spanish Chestnut timber, what may be its real character; a writer in your Paper, about a year ago, having pronounced it (in opposition to older writers) to be worthless. Considering it to be, upon the whole, perhaps the most beautiful tree (of the larger class) that will thrive in Britain, I should certainly much regret hearing that it had been proved to have little other value than as an ornament. May we hope that the quick-growing foreign Oaks (Turkey, Italian, American) will possess any other recommendation to the planter's notice? *W. H.* [We trust that, in answering this question, our correspondents will be kind enough to limit their reply to what is within their own knowledge, and to instances in which they are *certain* that Spanish Chestnut was used.]

*What has become of the Bees this year?*—I get a month's earlier amusement from my little garden than most of my neighbours by growing the varieties of Crocus in abundance. Now, generally speaking, the enjoyment of this flower (beautiful as it is) is much increased by its attracting the honey bees, and so giving life to the garden. This year, however, though my flowers are going off, and have bloomed abundantly, I have not seen a single bee upon them; nor, indeed, upon any other flower. Can any of your correspondents account for this, or confirm the lazy habit of the insect this year? *An Original Subscriber, Bath.* [Our bees are as active as usual.]

*Twigs of Spruce Fir.*—The ground around the trees is strewed with these, especially after a breeze of wind. I have not seen the Spruce Fir affected in this way until within two or three months past. Scotch Firs, in this neighbourhood (Forfarshire) have suffered very much of late years from the Hylurgus piniperda. *P. C.* [There is nothing in the twigs with which we have been favoured to indicate the cause of the circumstance alluded to. They look as if they might be growths beyond the gallery of the Hylurgus; but we find no evidence of it. Can squirrels be at the bottom of the mischief?]

*Importance of agitating the Air of Glass-houses.*—The account of the culture of the Victoria regia, in your Paper, has suggested the idea that the same principles may be employed to the advantage of all plants requiring close shelter at times; so that, instead of suffering as they do now, from the imperfect and ill-understood modes of ventilation in use, they may be as happy and comfortable as the Victoria, which refuses to live unless the water is in a state of constant motion. I have little doubt that all exotic plants would be much more healthy, if their atmosphere were similarly gently agitated, without a renewal of the air, which though, no doubt, beneficial, if not essential to plants, as well as to animals, under proper conditions, is as dangerous for weeks together to the former, as it would be to leave off a flannel waistcoat to the latter. I trust some ingenious person will be able to contrive, by a simple and inexpensive piece of mechanism, to keep the air in a state of circulation, when fires are necessary, and all apertures closed. A small agent would have a wide effect, but the action should be incessant night as well as day; and should it be accomplished, the inventor will, no doubt, publish it in your columns, *pro bono publico*, and deserve the thanks of multitudes, besides rescuing many hundred plants from stagnation or starvation. *An Amateur Subscriber.*

*Victoria regia.*—Perhaps it is not sufficiently known that the old specimens of this plant have died out, during the winter, at Kew, Syon, Chatsworth, and other places; and that it, therefore, appears to be little more than an annual. Those who cultivate it should, consequently, secure a succession plant or two, from seed, each autumn. *E. K.*——As you despair of seeing the Royal Water Lily cultivated in this country with success, without artificial heat being applied, perhaps you will excuse the liberty I take in offering an opinion. There are hot springs in various countries; and having seen at Bath, some years since, one in constant use, with a running stream about the temperature of 110° when first issuing from the ground, where would be the difficulty of conveying this water into a tank (of course with a covered roof) of any size that might be required for this noble plant? About 20 miles from the above city are coal mines, which could not be worked without the constant employment of a steam-engine to clear them from the water, which I saw running to waste, by the side of the road, smoking hot. Might not this be conveyed into a reservoir for the same purpose? Perhaps the same idea may have engaged the attention of some of your scientific readers; and, if so, will occasion a more profitable dissertation than many subjects of less interest (at least, in the opinion of gardeners) which occupy the attention of the public. *P., March* 17. [We have formerly pressed the value of their waste water upon the attention of its owners; but, we fear, with little success.]

*Market Gardening round London.*—I observe under this heading, at p. 149, the following sentence with reference to the conveyance of Strawberries to the London market: "The supply to the shops is conveyed to them by Welsh or Irishwomen, who carry them on their heads; these women being paid for every journey they make, earn a good deal of money at this occupation, in which they often walk 48 miles a day." Surely there must be a wonderful mistake here. Being myself somewhat fond of walking, I frequently travel in this way 20 miles a day, which I find quite sufficient for a continuance of some days, without carrying a basket on my head. The ladies, however, alluded to by your correspondent, if they walked fast would have to walk 12 hours' daily, which would allow no time for food or resting. I have looked through your last Paper, expecting to find that your correspondent would have corrected what I supposed to be a mistake; but I find no notice of the circumstance. Having read with much pleasure the articles hitherto published under this head, I trust that the public may have some explanation on this point; for feeling, as I am sure many others also do, that they are exceedingly useful and interesting papers, I should be sorry that an error of this sort should be the cause of the losing that attention which has hitherto been paid to them. *Pedes.*

*The Deodar.*—Your correspondent's inquiries concerning this Conifer have induced me to measure one that was planted in my flower-garden 11 years ago, and I find that it is 19 feet to the end of the last year's shoot (but of that about a foot is still hanging down), and the length of its longest boughs is 8 feet; at 3 feet from the ground it girths 19 inches. For some years it was supported by stakes, but a perfect straightness of stem has by no means been in consequence obtained; nor do I think that the somewhat unsightly twists that are to be seen in more than one part of it will for many years, if ever, cease to be apparent. I have another Deodar planted, five years ago, by the side of a walk in a wood. This is already 10 feet high; from the greater protection it enjoys, it will probably acquire a straighter growth. The soil of this country is little favourable for the growth of trees — stone brash, clay, and rock, constituting the substrata. *W. H.*——Your correspondent "J. H." says—"I have a great many plants of the Deodar, some 12 feet high, which show the greatest disinclination to hold up their heads," and you remark, "we should cut out such plants." May I suggest that a Deodar 12 feet high is much more easily cut out than replaced, and that it would be worth while at least to try what can be done towards straightening it before cutting it down? I should like to know whether the plants in question are crowded, or have plenty of room. Judging from the description, I should imagine that they have no tree or shrub within 8 or 10 feet of them, but that they have many tall trees in their neighbourhood. In this case the Deodar will throw out long lateral shoots close to the ground, which thicken the stem at that part, but the leader runs up very fast to a great height, with few lateral shoots, and, consequently, is weak. I am aware that the course I would suggest is contrary to custom; but observe that I only suggest it in lieu of cutting down the tree. Cut off the head where it begins to bend; choose the best side branch for a leader, and shorten the neighbouring side branches. You may also, for a winter, tie the new leader to an upright stick, just to help it in straightening. Then cut off close to the stem at least one-half of the thick mass of lower branches, in order that the tree may be driven to throw out shoots from above, which will thicken and strengthen the upper portion of the stem, and probably in a year or two (during which time you may gradually lessen the remaining lower branches), you will find that the tree has thrown out strong lateral branches higher up, weeping to the ground, and is making rapid headway. I am aware that the use of the knife is condemned as unnatural; and I am told that glorious Deodars have grown unpruned in the free forest. But remember what has been their youth. Reared amongst a whole jungle of competitors, the tree we now admire was, in its youth, crowded and drawn up without air for a single side shoot near the ground. Struggling for breathing-room, and racing upwards, he won the race, headed his contemporaries, and then was able to throw out side shoots, which overshadowed and killed his neighbours. Growing stronger and stronger, his lateral

branches spread, and soon the ends turned downwards and drooped towards the ground, and then he became (after and by the means of his struggles) that magnificent object, a tree with a clear stem, 20 or 40 feet high, and wide-spreading lateral branches drooping to the ground from that height. Now, what Nature does by lavish profusion of seed, I propose in some degree to imitate by the knife, though I would rather do it by planting Larch round the Deodar when commencing to plant. *H. C.*

## Societies.

Horticultural, *March* 18.—J. R. Gowen, Esq., Treasurer, in the chair. H. Bentley, Esq., W. F. Hobbs, Esq., G. Peabody, Esq., J. Butler, Esq., Professor Wheatstone, Mrs. Knox, Mr. Stevens, and Mr. Ferguson, were elected Fellows; and Mr. M'Intosh, gardener to the Duke of Buccleuch, at Dalkeith Palace, a corresponding member. Among subjects of exhibition was an example of the beautiful Jasmine-flowered Rhododendron (R. jasminiflorum), an evergreen greenhouse shrub, which was shown for the first time at Chiswick on the 18th of May last year. This came from the nursery of Messrs. Veitch, and was awarded a Banksian medal. A nice collection of Orchids, which received a Knightian medal, was exhibited by Mr. Mylam, gardener to S. Rucker, Esq., of Wandsworth. It consisted of a charming mass of the Cambridge Dendrobe (D. Cambridgeanum), the fragrant Burlingtonia, the long-tailed Lady's Slipper (Cypripedium caudatum), one of the best sorts of Skinner's Lycaste, together with the ivory-flowered Cymbid (Cymbidium eburneum), a variety of it slightly tinged with pink, and the beautiful Dendrobium anosmum, which is closely allied to the Rhubarb-scented D. macrophyllum. A Moscow Queen Pine Apple, scarcely ripe, and on that account unrewarded, was produced by Mr. Jones, gardener to Sir J. Guest, Bart. It weighed 3 lbs. 6 oz., a good weight for a Pine at this season of the year. Mr. Butcher, gardener to W. Leaf, Esq., showed a dish of Muscat of Alexandria Grapes, for which a Certificate of Merit was awarded. As might be expected, they were somewhat shrivelled, but they were, nevertheless, good eatable Grapes.—Similar awards were also made to Mr. Bennett, gr. to J. Smith, Esq., and to Mr. Higgs, gr to J. H. Barchard, Esq., for exhibitions of Keens' Seedling Strawberries. Mr. Bennett's fruits were perhaps the largest; but Mr. Higgs' were the best coloured.—Examples of ornamental rustic baskets, for placing flowering plants in, were furnished by Mr. Howlette, of St. Osyth, Colchester. They were of different shapes, so as to fit them for hanging up against the walls of entrance halls, or in conservatories, and were formed of wood encased in Larch cones, whose tops pointed outwards. The chains by which they were suspended consisted of the same kind of cones, fixed lengthwise in wire, and, being attached to the baskets by hooks, they could be separated from them at pleasure, thus facilitating the introduction of the plants.—Various dried vegetables, such as Peas, Haricot Beans, Brussels Sprouts, Carrots, and Turnips, &c., were exhibited from Peyrusset, Möller, and Co., of Paris. These were stated to have been dried by a process peculiar to M. Gannal, the celebrated embalmer of animal substances. This process is understood briefly to consist in dividing the larger vegetables into pieces, and placing them in an apparatus into which dried air is driven, until they have parted with all their water, and have become perfectly dry. In this condition they may be preserved for any length of time and it is said that their flavour is not at all interfered with, inasmuch as nothing is taken from them, except the water they contained, and that, after they are cooked, they are just as good as when fresh gathered. If these facts, therefore, are borne out by experience, the discovery is a very important one, even as regards vegetables, more especially to ship-owners, for they can be furnished in this state in quantity, and at a very cheap rate; but, in addition to vegetables, fruits, as Apples, Pears, Apricots, &c., and even flowers, may be dried and preserved by the same process, and, owing to the rapidity with which the drying is conducted, the latter retain their natural colours almost as brightly as when first obtained from the garden. In confirmation of this, several dried specimens were shown to the meeting; and it was stated that others would be present at the great Exhibition in Hyde-park, when it is to be hoped that additional information will be furnished on the subject. From the garden of the Society came a beautiful specimen of the Orange-flowered Epidendrum (E. aurantiacum), Mr. Blandy's variety of Dendrobium nobile, Lycaste cruenta, and a dull rose-coloured variety of the Guatemala species called candida, Eriostemon cuspidatum, Forsythia viridissima, a valuable hardy shrub, on account of its producing a considerable amount of gaiety either in or out of doors at this season; Azalea obtusa, and another Chinese sort unnamed, the former a very hardy, the latter a very early kind; together with Cytisus racemosus, and one or two other plants. Cuttings of the following Pears were distributed to such Fellows as wished to receive them. Glout Morceau de Cambron, an excellent variety, little known and very different from the common Glout Morceau; Beurré d'Amanlis, a melting Pear, richer than the Brown Beurré; Beurré St. Bernard, and Fourcroy, or Merveille de la Nature. The latter two are reported to be good; but they have not yet been proved in the garden.

Botanical of London, *March* 7.—A. Henfrey, Esq. in the chair. Several donations were announced, and the continuation of Mr. Stock's paper "On the Botany of Bungay, Suffolk," was read.

Stoke Newington Chrysanthemum, *February* 29.—J. Edwards, Esq., President, in the chair. The following is Mr. Taylor's lecture on the Chrysanthemum, referred to at p. 151 of a late Number. Mr. T. said, "I shall confine my remarks to the practice I have pursued in producing the beautiful blooms of this flower, for which our annual exhibition is distinguished. That perseverance and watchfulness are the only means by which we can hope to obtain success in our labours, is evident to all engaged in the cultivation of flowers; without assiduity on the part of the gardener, or amateur, nothing beyond ordinary results need be expected, and this is pre-eminently the case with the Chrysanthemum. I stated last year, that the cut blooms produced by me, at the exhibition of 1849, were from cuttings struck on a hot-bed, mostly as late as March, and afterwards gradually hardened off; but further experience has led me to prefer propagating as soon after the blooming season as I can get cuttings; as by striking early it enables the plant to store up sufficient matter in its young state to meet the demands made on in the growing season, for in my opinion the plant cannot be too strong, if the production of large and perfect blooms is the object in view. In selecting cuttings, I prefer the strongest suckers, with a portion of root attached to them. I then fill some 3-inch pots with sandy loam, and in each of these I insert three cuttings: they are then placed in a cold frame and kept rather close for a short time. I am opposed to striking in heat, as it deprives them of that robust habit in the early stage of their growth, which is necessary to ensure superb blooms. In April most of them will require potting: I then prepare a compost, consisting of one-third yellow loam, one-third rotten turf, and one-third rotten manure, mixing all well together, and adding sufficient rough sand, or grit, to make the whole porous. I shift them out of the three-inch pots into six-inch ones, care being taken not to disturb the young roots. After potting, I place them in the open air, in a situation sheltered from easterly winds, and sufficiently distant from each other to prevent their growing up weakly. During their growth, I frequently alter their position, in order to rightly balance their shapes, and to prevent their rooting through the pots into the ground. In the end of June, or the beginning of July, if all goes on well, they will be ready for receiving their final shift. This effected, by providing some large pots, in which there is plenty of drainage, and using the compost mentioned above, but in a much coarser state, I then place them in a situation fully exposed to the influence of the sun, adopting the same practice as before, and into each pot I fix stakes for tying the plants as they may want it; requiring, as the Chrysanthemums do, a liberal supply of water during the growing season, they should not, under any pretence, be permitted to suffer from drought; if this is the case, deformed blooms will often be the result; but, on the other hand, the soil should not be so drenched as to become soddened, for that would also prove injurious to a fine bloom, as well as to the health of the plant. If they are well established in their pots by the end of August, I commence supplying them with liquid manure at least once a week, beginning with it rather weak at first, but increasing its strength in proportion to the growth of the plant. I discontinue the manure-water when the blooms expand, previously diminishing its strength gradually until the supply is cut off. Constant attention is essential in the early stage of the growth of the plant. Without it the blooms will be indifferent. As laterals are produced I pinch them off, but I never stop the main stem. As soon as the blooming stems become visible, I remove all but three or four, according to the strength of the plant. When the flower-buds can be discerned I thin them, leaving one bud on each stem. I prefer leaving the centre bud, if it be round and perfect, but if at any time afterwards the buds show signs of being deformed I remove them at once. At this stage of the plants' growth the earwig will commence the work of destruction by eating the buds. My traps consist of Bean-stalks placed among the branches; they creep into these at night, and in the morning I blow them into a bottle of warm water, which kills them, and replace the stalk. As the blooming season draws near I remove the plants into the greenhouse. My object being to obtain large flowers they are not checked in their growth by stopping, they are therefore tall, and, to some, might appear unsightly; but to remedy this defect I intermix Camellias with them, the beautiful leaves of which afford an agreeable screen to their tall stems. By having the flowers on a level with the tops of the Camellias, a pleasing contrast is created, which is very effectual. I have cut some of my finest blooms froom plants grown under a south wall, where they were treated exactly as under pot culture; as soon as the blooms begin to expand they must be protected from wind, rain, and all kinds of inclement weather. Some of the varieties, which flower early, require shading from the sun; the later flowers should have a glass fixed over them, in order to enable them to fully develope themselves by the time fixed for exhibition. I need not say that a little attention should be paid to tilting the glasses, so as to allow the condensed moisture in them to escape, or it will destroy the under petals before the upper ones are in perfection. The following list contains the varieties which I consider most suitable for cut blooms. I have divided them into the two classes of cupped (or curved) and reflexed flowers. Cupped—King, Queen of England, Princess Marie, Duke, Goliath, Two-coloured Incurved, Dupont de l'Eure, Vesta, Beauty, Campestroni, Defiance, Pilot, Warden, Sydenham, Lucidum, Formosum, Golden Clustered; Reflexed—Salter's Annie, Jenny Lind, Phidias (new), Rabelais, Rebecca, Cloth of Gold. In regard to the properties which constitute a perfect bloom, I consider that each petal should be broad, thick, smooth at the end, and a little cupped, or curved, but not so as to show the under part too much; the centre should be good, the whole flower forming little more than half a ball. Vesta, in my opinion, nearest approaches these properties. As we cannot do without reflexed flowers at present, they should have broad, thick, smooth petals, lying regularly one over the other, and the centre of the flower should be good, as, for example, Salter's Annie; all loose flowers, and those that have notched petals, should be disqualified, as, for instance, such varieties as Zoe, General Marceau, Perfection, &c. The Anemone, or Aster-flowering varieties, should either be distinctly classed at exhibitions, or entirely discarded." After a short discussion, in which many eminent cultivators of the Chrysanthemum took part, a vote of thanks was awarded to Mr. James and Mr. Taylor for their respective lectures, and the meeting closed.

## Notices of Books.

*Botanique Cryptogamique ou Histoire des Familles Naturelles des Plantes Inférieures.* Par J. Payer. 8vo, Paris, 1850. Pp. vi. and 223, fig. 1105.

Though the work before us can scarcely be considered as much more than a clever compilation, from various sources, of interesting facts relative to the extensive division of vegetables known under the name of Cryptogams, it may very justly be recognised as a most useful contribution to the botanist in general. The facts themselves are scattered up and down through a thousand volumes, and the student who was desirous of any general information had no easily accessible source to which he could refer, till the appearance of the present volume and that of Körber, nearly of the same date, which we have already noticed. The numerous figures are in general very clear and well chosen, and the information just what is wanted. French authorities, as is natural, have been most referred to, but not to the exclusion of others, though it does not appear to us that the author is really always quite *au courant*.

Cryptogams are divided by M. Payer into five classes, Algæ, Fungi, Mosses, Ferns, and Rhizocarps, and these are again divided into numerous orders, families, and tribes; but we think him far from happy in his divisions, whether principal or subordinate. Lichens, for instance, are made a mere family of one of the orders of Fungi, and when it is stated that *Mucor*, with its allied genera, forms a division of precisely the same value in the same order, the incorrectness of such a partition is at once apparent. It is easy to understand the principle on which all the Ascophorous fungi and Lichens should be placed in one great class, though difficulties enough will arise by the way; but to make them near allies of the Sporophorous fungi, is not only against nature, but has not even the excuse of identity of structure in their reproductive organs. We believe the old Linnæan notion of their affinity to Algæ, to which some names of great authority are even now inclined, is much more tenable; not only however are Lichens included in Fungi, but a portion of them, such as *Opegrapha*, *Endocarpon*, &c., are separated from the rest, together with a portion of the fungi, consisting of such genera as *Hysterium*, *Sphæria*, &c., under a distinct family, broken up again into a number of tribes. We believe this association to be altogether wrong, and that the constant presence of Gonidia in Lichens is a good and permanent character, which will at once distinguish cases in which the analogy is the strongest, as in certain species of *Hysterium* and *Opegrapha*, provided the specimens of the latter be in a state of vegetation. In old weather-worn specimens, where the crust has vanished, it may be perhaps impossible to distinguish very accurately. As regards the genus *Verrucaria*, the same observations may be made, except where true fungi have been described as belonging to that genus or the contrary, of both which cases several instances might be brought forward.

After a careful analysis of Collemals and of certain Lichens, Mr. Thwaites discovered the closest resemblance between the structure of the frond and that of some of the lower Algæ, and quite at variance with that of fungi, the Palmelloid structure prevailing in some, and the Nostochoid in others. In cases of Anamorphoses of Lichens, it is very rare indeed that they assume a filamentous form, as is constantly the case with fungi under such circumstances. *Dictyonema* and *Cora*, which might be supposed the most favourable instances, have evidently, now that their mode of fructification is known, a fungoid structure, belonging in fact to the higher group of Hymenomycetous fungi under the guise of Lichens, to the fruit of which their hymenium bears no real resemblance, nor is the resemblance of their frond more than superficial. Indeed both genera have been placed by authors amongst Algæ. Even in those Sphæriæ, which really seem the least like fungi, and where the whole plant seems to consist of perithecium without any mycelium, a careful examination will generally prove the existence of myceloid threads; and if the genus *Capnodium* or its abortive forms, together with those of *Antennaria*, be traced in their different

stages of growth, it will be seen that the filamentous structure passes with the greatest ease into the cellular, till the hardest and most compact perithecia are formed. And, after all, the author is obliged to leave such genera as *Tympanis* and *Patellaria* amongst fungi, which are at least as truly Lichens as *Hysterium*, their analogy not being with those genera referred to *Hypoxylons*, but to *Lecanora* and *Lecidea*. It should seem, too, that Lichens may possibly be higher in point of organisation than fungi, inasmuch as they produce, in some genera at least, real Spermatozoids, which there is not the least reason to suppose existent in fungi, though in one or two genera, such as *Pilobolus* and *Endodromia*, not to mention a doubtful plant examined by Unger, motion independent of external influences has been observed.

Having pointed out a case in which we differ from the author, it is but right to indicate another in which he has deviated from the usual course with our complete approval. As regards the curious tribe of Truffles, he has not been led aside by their great external resemblance and general similarity of habit. The different groups are widely separated, in accordance with their true affinities, a point in which Fries has failed, in the closing part of his view of Scandinavian vegetation.

In conclusion, notwithstanding some points in which we think the author wrong, we have much pleasure in recommending this work to our readers, who, if the subject is new to them, can scarcely fail to derive much pleasure from its perusal; and, if they have been students of the varied objects it comprises, except they have had access to good botanical libraries, we doubt not that they will find much that is novel and useful.

## Calendar of Operations.

*(For the ensuing week.)*

### PLANT DEPARTMENT.

IT is most important at this season, when vegetation is in progress, that sufficient room be afforded to every plant; and that air be made to circulate freely among them. A collection of plants too large for the extent of glass is the common evil of nearly all gardens; and, in consequence of this, they are crammed together during winter, to preserve them from frost. Injurious as this is to their health during the dull months, the evil is ten times greater when they commence their spring growth, and for this reason they must be placed at proper distances asunder without further delay, even if the operation should involve a reduction in the collection; for it is far more satisfactory to all parties concerned to have a few well grown specimens, than several times the number of lanky etiolated plants, not one of which will stand the scrutiny of individual examination. As the spring is so far advanced, much may be done by removing many half-hardy or frame plants, to favourable situations in the open air, where they can be slightly protected, in case of very severe weather, by mats, canvas, or other contrivances; this will make room for some of the hardier greenhouse plants in the frames, where they will be much improved by their close proximity to the glass. The forcing houses, also, as they gradually come into work, will afford room for plants which require a stove temperature. If a sufficient quantity of young stove plants has not yet been propagated, no time should be lost, as cuttings will root with greater facility now than a month or two hence.

### FORCING DEPARTMENT.

As Vines are so often troubled with thrips, and as they do such serious injury if allowed to increase, which they soon do to an alarming extent, energetic measures should be taken for their extermination. Fumigation with tobacco is the best method of destroying them; but to render this mode effectual, the following points should be attended to:—A quiet evening should be selected for the operation, when the leaves of the plants are quite dry; the house, if convenient, should be covered with canvas, or something similar, to prevent the escape of the smoke through the laps; during the whole of the next day it should be kept close, and the shading should be kept on, to prevent the necessity of giving air, and also the more completely to retain the fumes of the tobacco within the house. This course checks the revival of some of the insects which were merely sickened by the previous evening's smoking; but to make sure of destroying all, the house should be fumigated again on the second evening. On the second morning the plants should be syringed, and receive air as usual; but if the day prove very hot, a slight shading will be necessary. If pure tobacco be used, it will kill all the insects in existence at the time; but it will be necessary to repeat the process three times, with an interval of eight or ten days between each fumigation, to destroy those which proceed from the eggs laid by the old insects before their destruction. In fumigating houses in general, a board should be fixed over the top of the smoking pot, about 6 inches above the rim, to diffuse the smoke, that it may not injure the leaves by coming directly in contact with them before it has been sufficiently cooled by diffusion through the atmosphere. This plan has completely destroyed the thrips, and we are happy to recommend it to others, as so many are complaining of the ravages of these miniature locusts. Though individually minute, they soon commit fearful havoc, not only upon Vines, but also amongst our choicest stove and greenhouse plants. Even the fruit of Pines is often attacked by these insects, and completely disfigured by them. STRAWBERRIES.—As the sun is now becoming powerful, the Strawberry pots upon the Vinery or Peach-house shelves will require frequent waterings. Pans should be kept under them, filled with manure for the roots to run in; or rough sand will assist to maintain a humidity about the bottom of the pot, and will often prevent the plants from flagging, although the soil in the upper portion of the pot becomes dry.

### FLOWER GARDEN AND SHRUBBERIES.

Herbaceous plants, which are now appearing above ground, will require a little attention to guard them against the ravages of snails. A timely dressing of soot and lime, sprinkled over the crowns of the plants, will not only prevent their depredations on the surface, but, being washed in by the rain, will preserve the bases of the young growths from their attacks also. Box edgings are notorious as a harbour for these plagues; and where beds containing choice plants are thus surrounded, it will be useful to lay a line of the above mixture along the inside, in order to insulate the plants. It will also be useful to hoe and rake the beds, both for neatness sake, and to disturb the underground retreats of our slimy friends, so as to expose them to the weather, and to the bills of their natural enemies. Biennials (as Wallflowers, Sweetwilliams, and Scabiosas), should be brought from the nursery-beds, and arranged in their summer quarters; beds of Pinks, Picotees, and Carnations should also be made; they are invaluable for supplying flowers for glasses, bouquets, &c. All dressed turf should now be well swept, rolled, and, if necessary, mown; it is a great drawback in the present appearance of the pleasure-ground, and a disadvantage in the after-keeping, to allow Grass to grow too long before it is first cut in spring. Where there is a large extent of open lawn to be kept in first-rate order, the horse mowing-machine is an invaluable assistant, as by it the Grass can be cut once in ten days or a fortnight at much less cost than it can be done once a month by the scythe. For firm, well-drained ground, the 42-inch machine will be found most economical; but for softer ground the medium-sized machine is preferable, as the latter may be worked with a lighter horse, and consequently less damage is done to the turf in damp weather. It is necessary to mention, that not more than a fortnight should elapse between the different cuttings, or the work will be more difficult to do, and unsightly when done. In order to have the full advantage of these machines, the turf should be levelled. This is what we have done, and the results are so satisfactory, that we feel pleasure and confidence in mentioning it in the Calendar.

### FLORISTS' FLOWERS.

Take care, as the stems of Auriculas rise, that they receive no check, whatever air they may get during the day; it is, comparatively speaking, under the amateur's control. It often happens, however, at this time of the year, after midnight, and when least expected, a sharp frost may take place, and should there be any flowers partly expanded, the effect will be prejudicial, inasmuch as the opening flower will become "set," or stationary; for this reason, the careful florist will cover his frames down well, with mats, &c., in order to preserve an equable temperature, or water them with soft or rain water, when they require it; should a strong plant, with an offset, throw two trusses of blooms, remove the weakest. If there is one thing more than another that requires the florists' care, it is the Tulip; a sudden frost is equally prejudicial to them as to the Auricula; hoops, nets, and mats are essential requisites; but even these must be judiciously applied. Hail-storms may be expected, and those who are unprepared, will, when too late, bitterly regret the want of care they have evinced in preparing the necessary protection. Dahlias, &c., as last week.

### HARDY FRUIT GARDEN.

Let all training and pruning be assiduously proceeded with, that it may as soon as possible be brought to a conclusion, particularly where the advice given in an early Calendar has been followed, by leaving unpruned those fruit trees of which the buds are liable to be injured by the bulfinches. Any trees which are furnished with a tolerable quantity of blossom-buds, and are not yet protected, should be immediately attended to. If canvas or netting is not available, evergreen branches must serve as a substitute. In applying them, use as many as will protect the blossoms, without depriving them of light, and let great care be taken that the buds are not broken or injured, in fixing the branches; and also that the latter are fastened so securely, that the wind may not be able to move them, and rub against the buds. All Pear and other fruit trees, except those too far advanced in bud, which are infested with scale, or insects of any kind, should now have the wash recommended in former Calendars, applied to their branches. This will be very effectual now, as the insects will be getting more active, with the increasing warmth of the season.

### KITCHEN GARDEN.

Let young plants of Celery, Cauliflowers, Cabbages, &c., raised in frames, be carefully pricked out as soon as they will bear handling. A spare frame placed upon a slight hot-bed, will answer best for the Celery; and a border at the foot of a south wall for Cauliflowers, Cabbages, &c. Watch carefully the crops now coming through the ground; and whenever slugs are found to be destroying them, let the ground be frequently dusted over with soot and lime; or let them be picked by hand, which is the surest plan. The planting of Potatoes, Jerusalem Artichokes, and Horse-radish should be finished without delay.

State of the Weather near London, for the week ending March 20, 1851, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 27th 1830—therm. 75 deg.; and the lowest on the 25th, 1850—therm. 14 deg.

## Notices to Correspondents.

TO OUR CORRESPONDENTS.—May we beg it to be understood that *we cannot answer inquiries privately through the post.* We are ready to give reasonable information through our columns, but we cannot consent to the labour of writing letters.

AMMONIA: *R V.* We will consider what further remarks this subject calls for.

ANNUALS: *H E.* Many plants that are annuals in cold countries live for several years in hotter ones. The common Ricinus makes a small tree, and Mignonette a bush. Some plants deciduous with us, become evergreens in better climates, as the China Rose, &c.; but in the hottest parts of the world some trees are periodically deciduous, such, for instance, as Erythrinas.

AQUATICS: *H A.* It will be better to act according to the evidence before you. We generally find that in these things organisation adapts itself to circumstances; and that what is naturally ⌣ becomes — if any unusual submersion requires it.

BOOKS: *W G.* "Cuthill on the Potato, Asparagus, Seakale, Rhubarb," &c., &c. Any bookseller can procure it for you, if he chooses.‡

CAPE BULBS: *J S.* The bulbs are of very pretty sorts. Pot them in fibrous loam, and grow them in a greenhouse like Hyacinths. That plan will produce you better flowers than turning them out into even a warm border.

CRANBERRIES: *M B.* There is no difficulty in cultivating the common Cranberry among peat earth and lumps of stone, provided *running* water will pass over and among it. Stagnant water will not do. But the American Cranberry may be grown in any garden in the same way as other American plants, only it should have a bed to itself.

GALVANISED IRON GREENHOUSES: *B.* will be obliged by some of our correspondents who have had these erected, informing him how they have answered.

GLAZE FOR CALICO: *J K C.* Three pints of old pale linseed-oil, 1 oz. of sugar of lead, and 4 oz. white resin. The sugar of lead must be ground with a small quantity of the oil, and added to the remainder, incorporated with the resin by means of gentle heat. Lay it on the calico with a brush. One coat annually is sufficient. ‡

INSECTS: *Miles.* Your Azaleas are attacked by the common Thrips. Repeated fumigation in as confined a situation as possible, with subsequent syringing with clear water, and ventilation, are the best remedy. *W.*— *W W.* The Acarus hatched from the small white speck-like eggs upon stones is a well-known species. It is the Trobidium (or Penthaleus) lapidum of De Geer and Hermann. Pray continue your observations, and communicate the result to us, with a more finished drawing both of the young and full-grown Acarus. *W.*

KIDNEY BEANS: *Constant Reader.* They are shanking off; why, we cannot say. *Perhaps* you have grown them in too much heat, and then watered them with cold water.

NAMES OF FRUITS: *D Thomas.* The Pear is not the true Knight's Monarch. The Apple is certainly like Pearson's Plate; but it may be found to be different, on comparing the wood and leaves.‖—*J P M.* Your Apple is the Dumelow's Seedling. ‖

NAMES OF PLANTS: *J P.* It is Aponogeton distachyum.—*J Weeks and Co.* It is not possible to name such a specimen; it may be a species of Puya.—*Poole.* Hibbertia dentata.—*F B.* Bignonia picta.—*J F W.* Crassula spathulata.—*A H.* Cassia tomentosa, a rare plant.—*J White.* Brasavola Perrinii.—*R D.* 3, Coronilla varia; 5, Bryonia dioica; 6, Delphinium consolida; 1, Alyssum argenteum; 2, very like a morsel of Lepidium ruderale; 7, Ervum Lens; 4, Onobrychis sativa.—*J A.* 1, apparently Epiphyllum truncatum; 2, indeterminable.—*W J E.* We are not sufficiently acquainted with the Camellia in question to be able to say whether that sent is the same sort or not.*

OAK BARK: *W F.* will thank some of our correspondents to say what is likely to be the price of Oak bark this season, and also the price of Oak, Elm, and Ash timber, per load, in different parts of the country.

ORCHARD HOUSES: *C A A Lloyd.* See a Leading Article on the subject, at p. 35 of the current year's volume. ‡

PRIMULA SINENSIS: *Old Gardener.* In show Polyanthuses if the pistil protrudes it is considered a defect. But we should not say that the flowers of Primula sinensis were worthless because that part was seen beyond the anthers.*

VENTILATION: *Novice.* Ventilation by top sashes is more effective than that by back ventilators. Having both, you certainly can command enough without opening sashes in front. But it would be better to give a little front air, and of course less at top will then be necessary. The necessary amount of ventilation is better admitted by many than by few openings.‖

VINES: *Sussex.* Your Vines will probably become less exuberant as they grow older. The roots ought not to go more than 2 feet deep into the soil, and probably will not, if the surface is in good condition. But they may *extend* a hundred yards or more in time, if they like the soil, and meet with no impediment. This will, however, be your gain, and must produce you very large and fine crops of Grapes. As a rule, Vine roots will keep to warm and open ground. We conceive that your fine rubble chalk is sufficient.

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS,

AS THE

ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by Dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | |
|---|---|
| Clover Manure, per ton ... ... ... | ...£11 0 0 |
| Turnip Manure, do. ... ... ... | ... 7 0 0 |
| Superphosphate of Lime ... ... | ... 7 0 0 |
| Sulphuric Acid and Coprolites ... | ... 5 0 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

ARTIFICIAL MANURES.—PRIVATE INSTRUCTIONS in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.

Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

PHOSPHATE NODULES, OR COPROLITES AND FOSSIL BONES (from the Suffolk Crag).—Manufacturers of Superphosphate of Lime can be supplied with the above, either in their natural form or finely pulverised, on the best terms, f. o. b. or delivered in the Thames.

Applications to EDWARD PACKARD, Chemist, Saxmundham, Suffolk, will receive prompt attention.

IRISH PEAT CHARCOAL.

TO FARMERS, AGRICULTURISTS, AND OTHERS.

MESSRS. ODAMS AND PICKFORD, 35, Leadenhall-street, having been appointed by the IRISH AMELIORATION SOCIETY sole Agents, for London, for the sale of their PEAT CHARCOAL, beg to say full particulars of prices, &c., may be obtained on application to them.

ODAMS and PICKFORD, 35, Leadenhall-street, City.

DESICCATED ANIMAL MANURE.—This Manure, which has proved so eminently successful in the culture of both Cereal and Green Crops, can now be had of the Manufacturers, J. M'CALL and Co., 60, Spring Gardens, Manchester; RITCHIE and M'CALL, 137, Houndsditch, London; and of all Agents. Price 7l. per ton.—Copies of Analysis and Testimonials forwarded post free on application. Agents wanted.

PATENT CREOSOTED FISH FOR MANURE.—This manure is composed entirely of animal matter. The analysis of an eminent chemist states that one ton of the prepared fish contains 263 lbs. of ammonia, 150 lbs. of phosphate of lime, and 39 lbs. of potash. It will be seen that they contain all the manuring properties of the best guano, and as they cannot be adulterated, they will be found to be a most useful manure for Potatoes, Wheat, Oats, Carrots, and all root crops. They also have the property of preventing the Potato disease. All the Potatoes planted with them last year, produced good crops, and were entirely preserved from the disease, although the neighbouring fields greatly suffered. See Report of the Royal Agricultural Society of Dec. 11, 1850. Price 5l. per ton. Orders received by Mr. HENRY HILL, Corn Exchange, Mark-lane; Mr. GEORGE BUSH, 22, Abchurch-lane; and Mr. BENNETT, 73, Mark-lane, London.

HOSE FOR LIQUID MANURE, Fire-engine, and agricultural purposes, made of canvass, lined and coated with gutta purcha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure, it is extensively used at the Government public works; also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, Esq., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.

STEPHENSON AND Co., 61, Gracechurch-street London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

PURCHASERS OF AGRICULTURAL SEEDS are recommended to peruse Messrs. SUTTON'S NEW PRICE LIST, which appeared in the last page of the *Gardeners' Chronicle* of March 1st. The advantages Messrs. SUTTON are enabled, by their extensive trade, to afford agriculturists in supplying *genuine home grown Seeds at the low prices therein quoted, and free of carriage*, will doubtless be appreciated in these times of economy and agricultural improvement. The following are a few of the articles therein enumerated:—

| Per lb.—d. | | Per bushel—s. d. | |
|---|---|---|---|
| Mangold Wurzel ... | ... 6 | Giant Saintfoin ... | ... 10 0 |
| White Belgian Carrot | ... 9 | Dickinson's improved | |
| Fresh imported Lucerne | ... 9 | Italian Rye-grass | ... 7 6 |
| Parsnip ... ... | ... 9 | True Perennial ditto | ... 7 0 |
| Ashcroft and other Swedes | 9 | Common ditto ... | ... 5 6 |
| Furze (Ulex Europæus) | ... 9 | Summer Vetches | ... 6 6 |

THE BEST SORTS OF PERENNIAL GRASS SEEDS £ s.d.

FOR PERMANENT PASTURE, *mixed expressly to suit the soil, with instructions for sowing, per acre* ... 1 8 0

SUTTON'S RENOVATING MIXTURE, *for improving old Pastures, per lb.* ... ... ... ... ... ... 0 0 10

Reading Seed Warehouse, Reading, Berks.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.

Incorporated by Act of Parliament, 12 and 13 Vict., c. 91.

*Directors.*

HENRY KER SEYMER, Esq., M.P., Hanford, Dorset—Chairman.
JOHN VILLIERS SHELLEY, Esq., Maresfield Park, Sussex—Deputy-Chairman.

| | |
|---|---|
| John C. Cobbold, Esq., M.P. | Edward J. Hutchins, Esq., M.P. |
| William Cubitt, Esq. | Samuel Morton Peto, Esq., M.P. |
| Henry Currie, Esq., M.P. | Colonel G. A. Reid, M.P. |
| Thomas Edward Dicey, Esq. | William Tite, Esq., F.R.S. |
| William Fisher Hobbs, Esq. | William Wilshere, Esq. |

The Company is empowered to execute—1. All works of Drainage (including Outfalls through adjoining Estates), Irrigation, Reclaiming, Enclosing, and otherwise improving Land.

2. To erect Farm Homesteads, and other Buildings necessary for the cultivation of Land.

3. To execute Improvements, under contract, with Commissioners of Sewers, Local Boards of Health, Corporations, Trustees, and other public bodies.

4. To purchase Lands capable of Improvement, and fettered by restrictions of Entail, and having executed the necessary works, to resell them with a title communicated by the Company's Act.

All owners of Entailed Estates, Trustees, Mortgagees, Corporations, Incumbents, Life Tenants, and other persons having only limited interests may obtain the use of the Company's powers to carry out every kind of permanent Improvement, either by the application of his own or the Company's funds secured by a yearly charge on the property improved.

Proposals for the execution of Works to be addressed to 52, Parliament-street, London. WILLIAM CLIFFORD, Secretary.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25l. per ton, and Rich Purple-brown, 20l. per ton.—Offices of the Company, 1, New Broad-street, London.—JOHN A. WEST, Secretary.

The Agricultural Gazette.

*SATURDAY, MARCH* 22, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, March 26—Agricultural Society of England.
THURSDAY, — 27—Agricultural Imp. Soc. of Ire.and.
WEDNESDAY, April 2—Agricultural Society of England.
THURSDAY, — 3—Agricultural Imp. Soc. of Ireland.

We promised to remind our readers, at the proper season, of the desirableness of Professor HENSLOW's experiment for the determination of the cause of CLOVER FAILURES. There are now three theories on this subject. One of them asserts the failure to be a mere case of starvation—want of sufficient "board" for the plant; a second that it is owing to a faulty texture of soil—want of suitable "lodging" for the plant; and the third that it is the result of disease arising from an improper treatment of the plant. It is to determine the soundness of the third of these suggestions that Professor HENSLOW suggests the following experiment. Let any farmer, whose land has proved liable to this disease, leave a single "ridge" of his Barley field unsown, except with the Clover seed. The idea is that the unnatural condition in which the Clover is commonly placed during so long a period of its growth, and the abrupt change of its circumstances at harvest time, weakens, or injures the plant, so that it cannot contend with the difficulties of the ensuing winter. If the disease attacking any Clover field should not extend to the experimental ridge, this suggestion will be corroborated. Should it prove a sound one, the value of the knowledge thus attained of it will, of course, far outweigh the loss of the Barley. Professor HENSLOW says:—"I have heard farmers say they cannot afford to lose the Barley, for the sake of keeping the Clover healthy; and they immediately arrive at the conclusion, that the experiment I have suggested would be useless. Now, I need not tell you, that even if the Barley turns out the primary cause of these failures, there would be no need of entirely abandoning its culture, in order to secure the Clover. Let us understand the merits and demerits of the case, and then your chemical experiments may furnish data for so far modifying present practices, as may enable farmers to raise their invalid crops of Clover over the difficulties to which they have subjected them."

Besides; a number of the details of Barley culture, on which opinion is still divided, might then be usefully decided in such a way as shall be most beneficial to the undergrowth of Clover—such are, the quantity of seed used per acre, the width of intervals between the drills, and the length of stubble to be left at harvest time. We hope, then, that some of our readers will not forget Prof. HENSLOW's experimental ridge at Barley seed time.

Of the other theories of CLOVER FAILURES—for the result may be owing to many causes—the more probable is that which attributes it to the mechanical condition of the soil. The best advocacy of this theory which we have seen is by the Rev. W. THORP, in the third volume of the "English Agricultural Society's Journal." The exemption of headlands, and other parts hardened by treading, from failures which have destroyed the rest of the field—the effect of "rest" in restoring the utility of land which has become "tired" of the crop—the similar effect of marling light soils—the failure of Trifolium incarnatum when the corn stubble is ploughed and cultivated for its reception, and its success when merely harrowed in upon the hard unstirred land—all seem to indicate a too loose condition of the soil, as in many cases the cause of the Clover failure.

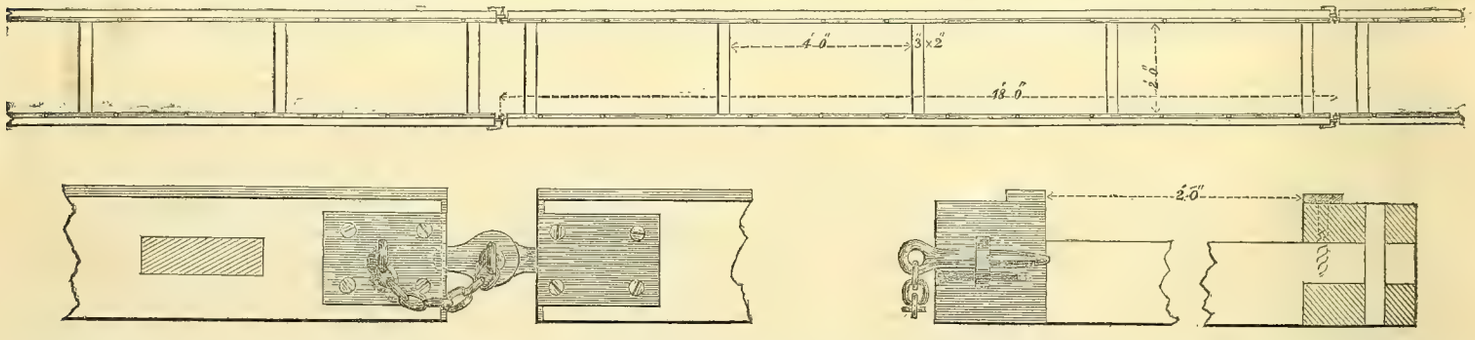
The chemical theory of its cause seems by common consent to be abandoned. Dr. ANDERSON, at the last of the Highland Society's monthly meetings, said as much. He had not ascertained differences in the composition of specimens of soil sufficient to account for the success of the plant upon one and its failure on the other; and that it is not the want of suitable food for the plant that causes its death, seems clear from the following experiments published by Mr. MAIN, of Lasswade, in a recent Number of the *North British Agriculturist:*

He says, regarding his experimental field:—"Intending it for Barley in 1849, I was anxious to plough it as early in the year as possible; and with this end in view, I began the ploughing in February. Bad weather succeeded after I had got the field exactly one-half ploughed, and from various causes I was prevented getting the other half ploughed till the last week in April. When the Barley was sown with the Grass seeds in the first week of May, the early ploughed division wrought very fine, finishing almost like an Onion bed. The late ploughed division, on the contrary, wrought raw and stiff, and the Grass seeds were sown on a cloddy surface. The whole field was sown with the same Barley and seeds. The braird, both of Barley and Grass, came away first on the early ploughed division, and for some time looked better, but at harvest little difference was observable: as I have already stated, the Clover, and especially the red Clover, was abundant. When the substances for experiment came to be applied on the 28th of May, 1850, the appearance of the red Clover was entirely changed. On the first ploughed half very few plants, or clumps of plants, could be seen; on the late ploughed half there were plants in plenty; a complete line of demarcation, formed by the red Clover, marked the spot reached by the early spring ploughing." Mr. MAIN argues from this, that the loose condition of the well cultivated half was the cause of the Clover failure. And in order to ascertain whether it could have originated in the absence from the soil of some substances required by the plant, he applied a variety of manures to the land. He says, "I took advantage of the division of the field by the early and late ploughings, and measured one quarter of an imperial acre on each division for each substance. The substances were thus sown in duplicate, first on the early, and secondly on the late ploughed division of the field; I also measured 'nothing' lots in each division, in the proportion of one 'nothing' lot to two top-dressed lots, the 'nothing' lot being in the centre, and the top-dressed lots on each side compared with it. The experiment is as follows:—

| No. | Substances employed. | Applied per imperial acre. | Cost of application. | Produce per imperial acre. | Duplicates. | Produce per imperial acre. |
|---|---|---|---|---|---|---|
| | | lbs. | s. d. | stone. | No. | stone. |
| 1 | Sul. of ammonia | 132 | 20 0 | 356 | 1 | 345 |
| 2 | Nothing ... ... | ... | ... | 244 | 2 | 223 |
| 3 | Gypsum ... ... | 172 | 3 10 | 244 | 3 | 211 |
| 4 | Sul. of magnesia | 246 | 16 6 | 254 | 4 | 200 |
| 5 | Nothing ... ... | ... | ... | 277 | 5 | 189 |
| 6 | Common salt ... | 107 | 2 10½ | 268 | 6 | 200 |
| 7 | Nit. of potash ... | 202 | 59 6 | 378 | 7 | 334 |
| 8 | Nothing ... ... | ... | ... | 277 | 8 | 211 |
| 9 | Sul. of ammonia / Gypsum ... ... | 66 / 86 | 12 11 | 312 | 9 | 244 |
| 10 | Mur. of ammonia | 132 | 27 1 | 397 | 10 | 312 |
| 11 | Nothing ... ... | ... | ... | 277 | 11 | 223 |
| | Average per acre | ... | ... | 297 | ... | 244 |

"I may mention that the *whole crop* on each lot was weighed, and the amount simply quadrupled, to

give the result per acre. An examination will show that the division of the field last ploughed gave the largest returns on all the lots, 'nothing' included. *These results are wholly to be placed to the credit of red Clover.* The Rye-grass on both divisions was equal, and if a difference existed, I am inclined to give it in favour of the Rye-grass on the early ploughed division. I attribute the superior results of the late ploughed division to the greater abundance of red Clover. On the whole eleven lots, the late ploughed division gives an average increase of 53 stones per imperial acre—*in other words* 53 *stones of red Clover.*



"My observations on the experiment during the growth of the crop are all against the idea, that the food theory has anything to do with the failure of Clover. None of the substances applied seemed to have any particular influence on the Clover plant, other than was exerted on the Rye-grass. Perhaps I should except the mixture of sul. of ammonia and gypsum. This application certainly produced a luxuriant growth of Clover. But whether luxuriant or the reverse, not one of the substances had the effect of producing a larger amount of Clover plants than the appearance of the crop warranted previous to the application; and certainly none of the substances not affecting the Rye-grass had any effect on the Clover. The substances having no effect may be stated as gypsum, sulphate of magnesia, common salt."

This, then, is one more proof, if any were needed, of the untenableness of the "food" theory of the Clover failure. There remain the suggestion of Mr. Thorp regarding the texture of the soil, and that of Professor Henslow regarding the treatment of the plant to choose between; and we hope that some of our readers may interest themselves in the matter, so far as to try the experiment we have named, and report its result next spring.

## MR. NEILSON'S FARM RAILROADS.

In reply to your enquiries, I beg to say that the following circumstance led me to invent and adopt the plan of portable railways, of which the "*Times* Commissioner" took such favourable notice in his report on South Lancashire. My farm consists of heavy clay land; and when I first took it, was entirely undrained, and composed of many small fields, averaging about 2 acres each, separated by large crooked fences, with wide ditches and abounding in pits, from which, according to the ancient custom from time immemorial, the land had been dressed with marl, as the only means of procuring a succession of Wheat and grain crops, by which the soil had been exhausted. I of course commenced my operations by draining, but on a piece of this land not yet drained, where I had levelled the fences and filled some ditches and pits, I sowed some Turnips, having previously well manured and deeply ploughed it; and the novelty of this proceeding having excited its gratitude, it grew me a fair crop. The price being high in the Liverpool market, (7 miles distant) I loaded two carts one afternoon, in order to send them off early the nex morning, leaving them in the field during the night. Unfortunately, it rained heavily, and the carts having been left beyond the filled up ground, the result was, that the united efforts of 4 horses brought away the shafts, but left the loads up to the axles in the mud. I had not then heard of Prince Albert's ingenious mode of uncropping a similar field by passing the Turnips from hand to hand, like so many cricket-balls. So I invented a rude sort of railway of wood, by which I removed the whole of the crop in time to realise a good price. I have since improved it considerably, until it has resulted in the subjoined sketch, of which Mr. Crosskill, of Beverley, took the pattern, and now makes it for sale.

I have used it for the last nine or ten years always in taking off my root crop, and frequently in putting on manure. In the latter, at the request of the Duke of Richmond, I made an experiment which proved it to be far more economical than horse-labour. Lord Derby used it extensively to convey tiles to drain an extensive piece of moss land, and afterwards to cover it with marl, when neither horse nor cart could have gone a yard without sinking up to the girths or axletree; and many parties, both in England and on the continent, to whom I have sent the description, have used it with unvaried satisfaction. I may perhaps mention, that I am now excavating three liquid manure tanks of the following dimensions, to follow the spirited example set by Mr. Kennedy and Mr. Telfer, of Ayrshire, viz., 100 feet long by 12 feet wide and 15 feet deep, each. The excavation is through stiff clay and marl, and I find the greatest possible advantage from the use of this railway, laid on a very steep incline and pulled upon a frame under which the cart is backed and the waggon at once discharged into it. Each waggon holds a single horse load. The form of the rail is as follows:—The sides are of the common deal, 18 feet long, or shorter if thought more desirable, nearly 3 inches deep, and 2½ thick. A balk of timber, 18 feet long and 12 inches by 13 square will cut up into 20 of them. They are connected by means of wooden sleepers of tougher material (slabs or thinnings of Oak, Ash, Beech, &c.) 2 feet 5 long, 3 inches broad by 2 inches thick, and mortiсed through the side pieces about every 4 feet; the tennant is left on the upper side of the cross piece, and the mortice is cut in the side piece so as to allow the bottom of it and the cross piece to be on a level, so that the flange of the wheel will travel above. The tennants are fastened by a half-inch wooden pin, driven through the side piece ⅜ of an inch from the outer edge; on the upper and inner edge of the side piece is laid a strip of iron from ¼ to ½ an inch thick, and from ¾ to 1 inch broad (according to the weight of work required over it) screwed down at every 15 or 18 inches with 2-inch screws, the heads being countersunk in the iron rim. Thus the iron strip is clear of the wooden pin that fastens the cross pieces, and need not be removed if any of the latter break and require renewing. The ends of the iron strip are bent over the ends of the side rails and let in flush, and are secured by a band of hoop iron covering the mortice hole outside, passing round the end, and for 6 inches along the inside of the side rail, and through this plate is fastened the joint for attaching to the next rail. After many contrivances I have found the following the best and most convenient mode of connecting two consecutive rails together: a pin 3 inches long, of half-inch square iron, turned with a half-inch eye at one end and driven nearly home in each end of each side piece. Care must be taken that these pins are fixed half an inch on the inside the centre on one end, and half an inch on the outside of the centre on the other end of the same rail, so that when two rails are brought together the two pins of the one rail are both inside or both outside the two pins of the other rail, which prevents them separating sideways, and the eyes being level are fastened by a half inch pin or plug put through them, and which, forming a joint, enables the railway to be laid more easily over undulating ground. These pins or plugs are secured to the side pieces by a small piece of light jack chain. Though this description is but an imperfect one, I trust that with the accompanying sketch it may be sufficiently understood to be tried; and where the surface is suitable and not too hilly, I'll answer for it that on heavy land it will not readily be discontinued. Of the waggons and turntables I presume no description is needed; the latter is very simple, adapted to the length of the former, and costs about 10*l.* The former will hold about 10 or 12 cwt. of Turnips, and discharges sideways over the wheel, which is about 18 inches high. Cost, about 2*l.* 15*s.* or 3*l.* My arrangement for getting off my Turnips is to deliver the rails, waggons, and turn-tables in proper working order to the labourers, who contract to deliver the Turnips at the field gate at so much per acre, and to restore the rails, &c., in good order, or pay for breakage and damage. I fear I have trespassed too much on your valuable space, but presuming your motive to be to impart information, and mine to give others the benefit of what I know to be practically useful, it will, I hope, plead my apology. *R. Neilson, Halewood.*

## TULL'S HUSBANDRY.

The high commendation in the *Gazette* of Feb. 15th, of Mr. Smith's method of applying Tull's system, by so competent an authority as Mr Hewitt Davis, makes a further inquiry into the matter of some moment. The same method was related in last year's *Gazette*, in a review of Mr. Smith's pamphlet. Being a practiser of Tull's system I perused the pamphlet, and came to the conclusion that Mr. Smith had not made out a case justifying anything beyond mere small experiments. But Mr. Davis's endorsement has caused me to doubt, and the best proceeding appears to be to publish an analysis of the statement, and call for further explanation on the part of its author. As further inducement to this investigation, let me add, that I can say feelingly with Mr. Davis, "my own experience in farming has taught me," that dependence on stock-keeping is carried to a most imprudent extent—an extent involving all the fallacy and loss consequent on any excessive investment of capital in a particular product, whether corn, cattle, cotton, shoes or hats. Now, the first and principal point, on which very much further information is wanted, is the item, "one double-digging of the fallow ground, being 2 feet of every 5 feet." The cost of this is stated to be 1*l.* 10*s.* for an acre; but in the pamphlet it is stated to be 2*l.*, for the first year. The former is at the rate of 3*l.* 15*s.*, the latter at the rate of 5*l.* per acre, if instead of two-fifths only, an entire acre were similarly dug over. Now I want to know what sort of land this is, and what is the money earned by the labourer, for double-digging, to be done at this exceedingly low price. Partly in consequence of this pamphlet, I had a piece of land trenched last October. The man was a very able person, well used to the work, thoroughly desirous of doing his best, well knowing my wishes, that if I could see my way, I would quickly enough employ him and a dozen more at the work, and I had perfect leisure to watch him the whole time he was at it. I paid him 13*s.* a-week of 9½ working hours per day, he finding his tools, pickaxe, and spade. The land was a stiff flinty loam, such as is common on the chalk districts. The ground was certainly very hard and dry last October, but I am certain it could never be done without a pickaxe, except in very wet weather, when it would turn up too cloddy; nor could it be done deeper than 8 inches then without a pickaxe, on account of the large flints which occur at that depth, at about the rate of 12 one-horse cart-loads per acre. It was done in this way: first the pick-axe went along the breadth of the piece, then the spade threw out what was loosened, then the pick-axe again, then the spade, and, lastly, the pickaxe merely raised up or loosened 4 or 5 inches of earth. The whole depth turned out was from 10 to 12 inches, and the bed of mould when finished was about 20 inches deep, judging by thrusting a walking-stick through it. It certainly was a beautiful piece of work, the dry weather bringing it up fine, and the large stones got out. Now the man did not, and, I am satisfied, could not do more than two poles a-day, making the cost somewhere about 9*l.* per acre. It was decidedly hard work, requiring a man to live well, and entitling him to a good remuneration. Mr. Davis says Mr. Smith's land is trenched 2 feet deep. This means, I presume, that the dry and finished bed of mould was 2 feet deep. But even this astonishes me that it could be done at the price; for here is another important consideration—it must be much easier to trench a piece of land of considerable length and breadth, than to trench 2 feet wide between rows of Wheat, and to keep 6 inches clear of the rows. My trenching 12 inches deep raised the ground 8 inches. Had this been between rows of Wheat, the greatest caution would have been required to keep the earth from slipping down and burying the Wheat, which must have proportionately increased the time and expense. These remarks, I trust, justify me in asking for further and exact particulars of the soil, the mode of double-digging, the depth, and the rate of wages, with the working hours in a day. And I shall rejoice if the answer should be to show that my mode of trenching has been so effectual, that ever after it will never require to be repeated, but may be kept in easy digging order, provided it be not trampled on by horses, except at harvest. For it is the trampling of horses in ploughing, harrowing, and rolling, that seems to me so speedily to undo our work of stirring. My trenched ground does not seem to have sunk an inch, though it has been done four months and had the winter rains. The above further information on this first item of double-digging will probably render unnecessary anything further on the next two single forkings.

I come now to the third item, "pressing, sowing, hoeing, carrying, threshing, and rates, which are put at 2*l.* 1*s.* If my memory does not deceive me, this was stated in the pamphlet as the probable average cost of the whole together over most localities, rather than the actual sums paid in the particular case. These latter would be more satisfactory, as, how many boys following the presser, how many hoeings, how much per quarter for threshing, and how much for rates. Tull's husbandry so lets up the weeds, that hitherto I have found two hoeings insufficient. My rates are 5*s.* an acre, and with this I cannot bring the entire item within 41*s.* But reaping appears to have been altogether forgotten. Now, from the enormous weight of straw, I judge the reaping to be extremely close to the ground. There is not much saved in reaping Tullian Wheat. The stoutness of the straw and the width of the rows renders the task

not much less than more rows of slenderer straw close together. This reaping would be 10*s.* an acre with me. Again, the following items are omitted—thatching, taking in rick, and marketing, which together I should put at 9*s.* an acre. There is still another item of cost. The straw is stated to be 1 ton 12 cwt., and worth 3*l.* 4*s.*, which is 40*s.* a ton. Mr. Smith, if I remember right, stated in his pamphlet that it was worth that to him for his stock. I can only say that I live in a district where there is a very good sale for straw, and where I frequently sell a few trusses at 8*d.* a truss, but I could not get more than 6*d.* a truss upon the premises, if I were to sell a ton or more, and sometimes not more than 5*d.* And if straw is to be sold, there is a charge of 2*s.* 6*d.* per ton for trussing. Scaring birds too at the rate of 3*s.* an acre is an item which ought at all events to be calculated on, to be on the safe side.

Now let us see what these additional items come to. First, there is trenching at 9*l.* an acre. Say it would never require to be done again. But if one were to sell one's land, who would pay for it? One must, therefore, get this principal returned in a few years. Say a guinea a year would be prudent expectation to return capital sunk, and 9*s.* a year more for interest in the meantime, making 30*s.* more for annual outlay. We must say another pound at least for reaping, thatching, taking in rick, and marketing. Then there are probable expenses, for trussing straw and bird-keeping. To the statement of cost then given by Mr. Davis, I am compelled to add 50*s.* per acre. I cannot hope for more than 30*s.* a ton for my straw. This reduces the return by 16*s.*, and adding to 50*s.* increased cost, the "net profit of 3*l.* 0*s.* 6*d.* per acre," estimated by Mr. Davis, will be changed into a net loss of 5*s.* 6*d.* per acre. Mr. Davis, however, arrived at his profit by allowing "40*s.* an acre to cover rent and interest of capital, and 40*s.* an acre more for provision for contingencies and dressing;" allowances so ample, that I am not satisfied to dismiss the case, especially as, on Tullian principles, I do not think there would be a cost of above 5*s.* an acre for dress; and that principally consisting of phosphates, being more and more convinced that stirring while the crop is growing, renders unnecessary the application of ammonia in such quantity as is required by an unstirred crop. One question more, as a Tullian farmer, I should like to have answered. How did the crop succeed this year? Mine was so excessively blighted that I had but 10 bushels per acre; whereas my crop, by the usual husbandry, I estimate at 30 bushels, and the Tullian fetched but 32*s.* a quarter the same week that some of the other fetched 38*s.* And again, is not Mr. Smith's land fresh broken up within the last five years? The great weight of straw would seem to indicate this, as well as the produce of Wheat. But this only shows the propriety of a fuller description of the soil. I have assumed the 9*l.* for trenching done at one before the commencement of sowing. Mr. Smith's plan is, however, to do two-fifths only the first year of the growing crop, and two-fifths the next year. For the reasons above stated, this appears to me impossible, except at a very great expense in doing it carefully, and preventing the raised earth from burying the Wheat. But the great objection to Tull's plan is the bad quality of the Wheat. I have this year some Beans on the same plan, which, perhaps, will not hurt in quality, to be followed by thicker planting of Wheat, and then Beans as before, the trenching to be done only or mainly during the Bean crops. If, however, it is possible to describe by words the process of digging between the rows, and so render an actual inspection unnecessary, Mr. Hewitt Davis and Mr. Smith will confer a great obligation on the distressed and overstrained British farmer. *Amicus Tull.*

## Home Correspondence.

*Open Furrows on Well-drained Land.*—I maintain the necessity for open furrows. We have had heavy floods to-day. The drains have discharged most abundantly, but on the heavy land quite as much water has passed from the surface as from the under drains whilst it continued raining. This remark applies to land drained 32 inches deep, at only 4 yards apart, and filled 10 inches deep with pipes and stones, as described in my first pamphlet; also to land drained 4 feet deep, with pipes at intervals of 28 feet. The drains had the capacity to discharge more water than they did, could it have reached them, but the continuous rain supplied water faster than the physical character of the soil permitted it to permeate or filtrate. These remarks apply to 100 acres, which I closely examined to-day during a continued heavy rain. Let me not be misunderstood. The stetches and furrows are not the absurd mounds and tortuous valleys of our midland counties. The stetches are flat, the small narrow furrows being about 6 inches deep, and not perceptible on a good Wheat crop at harvest. The water sighs into them invisibly, but the aggregate of these weepings in long distances forms a flood of tears of very awful proportions. Water or cross furrows intercept and convey them away, ere they acquire on hill sides too great a momentum. In our undrained heavy Essex lands it is no uncommon thing to see cart-loads of fine earth thus washed into the ditches. How strange—is it not?—that I cannot persuade our heavy land Essex friends, that it would be useful and profitable to drain their strong clays. They will not even try it, so they suffer smartly for their obstinacy in wet seasons. I hope your correspondents will continue to discuss this open furrow question, especially our north country friends. I find practically that deep cultivation, by subsoiling, trenching, &c., greatly facilitates the passage of water. I have a strong conviction that our agricultural pie-crust does not exceed, as an average, 4 inches on the solid or land side. I have seen much ploughing not 3 inches, or about the diameter of the mouth of a wine-glass. If some of our supposed deep ploughers will carry, as I sometimes do, a wine-glass in their hand, and place it in the track of the plough, they will be surprised to see so much of it above the earth; and after all it is only 5 inches high! Allow me to say, that the first 30 acres I drained with pipes and stones at 12 feet apart is perfectly drained; the crops being ripe evenly over the whole field. I am almost inclined to revert to my old theory, that the area of porosity in drains has something to do with increased facilities for drying land. *J. J. Mechi, Tiptree-hall, March* 15.

*A good way of Painting Farm-buildings.*—Having, some years ago, to superintend the erection of a great number of farm-buildings, and it being the particular wish of the nobleman, on whose estate they were built, that they should be rendered as durable as the material employed would admit, viz., timber in all parts, with the exception of the roof and foundation, I had all the body of the buildings done over with a mixture of gas-tar, two parts; pitch, one part; the other part half quick-lime and common rosin, put on quite hot; it requires two coats at least, three is better, the first to be perfectly dry and hard before the second application; while the last coat was still soft I had dashed on it, with a trowel, well washed sharp sand, or more properly minute flint stones, which remained after several washings; this we managed by the assistance of a fine wire sieve, and a stream of water with a good fall; this forms a perfect stone face to the timber; and from the appearance of them when I last saw them, they were likely to last many years longer. The sand should contain no stone more than three lines in diameter, in fact, if all the earth is washed out, the smaller the better. The window frames and doors were done over with the commonest paint I could get in London, a stone-colour, three coats, besides the priming; the paint mixed thick, and darted over in the same manner as the rest of the building, with a still finer sand; this also appeared to stand well; the sand must be made perfectly dry before it is used. The expense I cannot exactly state, as I cannot lay my hand on the book just now, but I know it was not much, and has given great satisfaction. It is right to state that the wood-work must be perfectly dry and well seasoned before this mixture should be applied; it is better to wait a year to effect this end than put it on green wood. *E. X., near Braintree, Essex.*

*The present state of Irish Agriculture.*—In my former letter I succinctly showed that the cause of Ireland's wretched husbandry was to be traced to the apathy of landlords as to the improvement of their tenantry. It is only now that proprietors are awakening from their lethargy to a full sense of their neglected duties, which has been the means of consigning many a happy family to irretrievable ruin. The progress of the people has aroused our dormant landlords to a direful contemplation of their darkened future; they see their tenants destroyed from the mere want of attention and encouragement to their interests—for landlords have ransacked, where they could come at, the available effects of their tenantry, to satisfy the pressing demands of threatening creditors. Eviction is sure to follow a penniless tenant, aye, eviction from a dismal, yet to the suffering tenant, a home; either subsequently to live at the mercy of a relieving officer, or die, between the struggles of famine and misfortune. The few who have withstood the crushing demands of a bankrupt landlord, too proud to brook a diminution of those pleasures to which he clings, and that style of living for which he is unable to pay, are yet verging onwards to the vortex of ruin, because they are not able, from the want of education and economy, to pass into that transition state from imperfect husbandry to successful farming. The time has passed when Potatoes could be used as a "guardian angel" to appease the rack-rent landlord, and meet other personal engagements: the time has passed when prejudice and custom dictated at the cost of common sense, for society is now throwing off the chains which fettered its progress, and emerging into the light of science, reason, and truth. Farming must now be based upon the practical application of scientific principles and a skilful employment of labour, so that an increased quantity of food may be produced both for individual emolument and adding to the material comforts of the nation. How are Irish farmers to keep pace with the go-a-head tendency of the age? Will their slovenly tillage warrant their onward progress, and be the stability for the nation's weal? Will a reckless abandonment of every established principle of improvement—a wilful disregard to recognised facts—where a studied exhaustion of the soil's expiring fertility is thought of, and no more—be permitted as a *succedaneum* for a system of cultivation whose pseudo-routine has been disorganised by the wholesale destruction of a single crop? Can Irish farmers practise husbandry where green-crop culture is but an experiment?—where it is doubtingly received, because it requires a little extra attention to be successfully pursued?—where the management of manure is heedlessly attended to, and the drainings of the manure-heap kindly invited along a prepared channel, to empty into the nearest stream? Does this not drain the purse? Irish farmers are strangers to the advantages of house-feeding cattle—to the economic breeding, feeding, and rearing of cattle—in fact, there is no harmony in their systems of management; a repelling power predominates, which frustrates all attempts at reform—which produces a kind of culture that deteriorates instead of improving, and destroys every effort for permanent good. And what is this to be all attributed to? Assuredly to the farmer's ignorance—to his want to discriminate between that which is solid and practical and that which is speculative and unproved. This leads me to notice some of the means for improving the agricultural class in Ireland. The first of which, as being first established for giving an impulse to the improvement of Irish agriculture, stands the Royal Dublin Society, established in 1737, with a Parliamentary grant. The objects of this society, which partly bear upon rural industry, consists in holding an annual cattle show in spring, open to all Ireland for competition. As the show is ever held in Dublin, its benefits are naturally availed, with a few exceptions, by Dublin and its adjoining counties. If the exhibition was held alternately in the different provinces, it would excite more attention towards rural improvement in those backward districts, far removed from the vicinity of its workings. *Libra, Feb.* 12.

*Chicory.*—In the volume of the "Agricultural Survey" of Arthur Young, published in 1808, giving an account of the state of agriculture in the county of Sussex, there is the following passage respecting the cultivation of Chicory, p. 145:—"This plant, by the experimental improvement of the age, has recently been introduced to the knowledge of the farmer. For rapidity of growth, luxuriance of burthen, nutritious qualities of the food and duration, it stands unrivalled; all sorts of cattle and sheep feed upon it with avidity. Where it has been cultivated, it is usually sown with Lent corn, mixed in a certain proportion of other artificial Grass seeds. The Earl of Egremont having ascertained the merit of it, spread the cultivation over several acres, and finds it a most useful and profitable plant. In 1798 and 1799, he had above 100 acres of it, and the use it was of to him in the support of an immense stock of cattle and sheep, exceeded everything that could have been expected from the soil; and the benefit would have been still greater, had that stock been still larger, for much of it ran to seed." In the account of this plant, by the Rev. W. L. Rham, in his valuable work, "The Dictionary of the Farm," it is stated that "the result of some accurate experiments on a large scale, made in France, has been unfavourable to Chicory, as compared with Lucerne, and other green food, in consequence of its giving a disagreeable taste to milk and butter, when cows are kept upon it." But he adds, that "for sheep it is very good, and a small portion mixed with other food may probably be a preservative against the rot." A very favourable account is given of this plant by Arthur Young in the "Farmers' Calendar," published in 1815, who says that "whenever it is the farmer's wish to lay a field of Grass by way of resting the land, or of increasing the food of sheep, he cannot hesitate. There is no plant to rival it." These writers are directly at issue as to the character of the soils upon which Chicory may be grown with the greatest advantage. Mr. Rham says that "the land should be rich, deep, and high." Mr. Young says that "on poor, barren, blowing sands, such as many districts abound with, especially in Norfolk and Suffolk, it will yield a greater quantity of sheep food than any other Grass in cultivation;" and that "on fen and bog lands and peat soils it thrives to much profit." If any of your correspondents can communicate the result of their experience, with respect to the cultivation of Chicory, as an article of food for cattle and sheep, they will much oblige *R. W. B.*

## Societies.

### ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Weekly Council; March 12: Sir Robert Price, Bart., M.P., in the chair.—*(Continued from page* 172*).*

Salt in Agriculture.—The Baron Mertens, a life-member of the Society, residing in Belgium, attended the Council for the purpose of calling the attention of the members to the great interest felt at this moment by the Government and farmers of that country in reference to the value of common salt as an application to the land and crops, and as an adjunct to the food of animals on a farm. As opinions on these points varied so much, according to the circumstances under which the experience had been gained, he was anxious to ascertain, if possible, the best information on this subject, which he thought important to all cultivators of the soil, and feeders of cattle. The abuse of salt in Belgium had become, he stated, a real ruin in some cases to the tenant-farmer, as well as to the landed proprietor; and he had been given to understand, by some of his friends in England, that it had not answered well with them. Salt he believed to be, to a certain extent, useful to fattening stock, if not forced upon them, but placed in their way, in order that they might take as much of it, and at such times as they felt disposed. In France it had been thought very advantagious to live stock, by M. Barral, M. de Beague, and others; but the experiments, in his opinion, were not at all satisfactory. It had lately been found in Belgium that ordinary doses of common salt had proved to be the cause of abortion among the farmers' breeding stock; in one case 22 cows out of 30, and in another 38 out of 40, slipping their calves, in consequence of their having had salt administered to them; some animals, too, in the same house, experiencing similar effects, on having salt given them, while the rest, to which no salt had been given, proceeded to maturity in their gestation, without injury or

mishap. Baron Mertens was also desirous of ascertaining whether the reduced price of salt in England had led to a greater consumption of it for agricultural purposes generally. There was one point, also, to which he wished to call the attention of the meeting, namely, whether animals of vigorous constitution, and in high condition from being supplied with a great variety of nutritious food, are affected either favourably or unfavourably by the use of salt when already submitted to a heating or exciting alimentation?—Professor WAY referred to the Commissions of the French and Prussian Governments for inquiring into results obtained in this country from the agricultural employment of common salt. He had not himself seen their respective reports, but he had believed they were unfavourable to fiscal measures for a cheaper importation of that article of commerce into their respective countries. The salt companies had also directed much attention to the application of this article of their manufacture to the uses of the farmer, with a view to increase its consumption. The evidence adduced in all these cases had been of a very conflicting character; but he thought local circumstances had much to do with the results, in reference to atmosphere, soil, and the character of vegetation. Inland districts might receive benefit from an application of salt, which would be superfluous, and even injurious, to those situate near the coast and within range of the saline vapours of the sea. He considered the counties, for instance, of Gloucestershire and Somersetshire within such influence. He believed salt did good on chalk; not indeed as common salt, but in consequence of the decomposition effected in it by the chalk, and the two new compounds which resulted from that double chemical action; namely, muriate of lime, a deliquescent salt, retaining moisture on the chalky soil imbued with it, and carbonate of soda, a salt useful in many cases in promoting the growth of plants or the decomposition of animal matter. The fishery salt employed with so much success by Mr. Fisher Hobbs, contained not mere salt, but also animal matter, on the advantage of which no doubt existed, and oily matter, on the action and advantage of which there was much difference of opinion, although Dr. Hunter, of York, regarded it as the great principle of the pabulum of plants, when united with alkalies into a soapy compound, soluble in water, and capable of being taken up by their organs of nutrition. Turnips, Beet, and other roots contained a large amount of salt in their natural composition, which was accordingly taken in at the rate of something like half-a-pound a day by the animals feeding upon them; while the Grasses were almost entirely free from that saline ingredient. He thought the subject of the agricultural use of salt an important one for special discussion on some future occasion; and should it be the wish of the Council for him to deliver a lecture before the Society in the month of May next, he would willingly make this topic a leading one in such lecture, if such introduction should meet with the approval of the Council.—Sir THOMAS ACLAND remarked that it was an acknowledged fact in the west of England that corn grown on the north coast of Cornwall, and several miles inland from it, not only fetched the best prices, but made better and lighter bread than the corn grown in other parts of that district. That effect had been attributed to the briny matter brought on that coast and its neighbouring county by the heavy gales from the Atlantic Ocean, to which that portion of the west of England was most exposed. In proof of the extent to which the briny exhalations from the sea could be carried by the wind under such circumstances, he adduced the instance of Lord Clinton's residence, which, though situate 20 miles from that element, had sometimes its windows covered with saline incrustations after a storm from the west.—Mr. Karkeek, in his prize essay on the agriculture of Cornwall (*Journal*, vi., 439), makes the following reference to this saline impregnation and deposition, which elucidates the remarks of both Sir Thomas Acland and Prof. Way—"The salt of the ocean can be detected by the taste on the blades of Grass in the northern parts of the county, full 10 miles from the sea-shore. The application of sea salt is found to act beneficially on soils in some inland counties, but it is seldom found of any service on those of Cornwall. This seeming anomaly is thus accounted for. There cannot be a doubt that most of our plants in Cornwall get quite enough of this substance, without applying it in the shape of a manure; for when the ocean dashes with violence against the rocks, and the crests of the waves are white with foam, the winds carry away the spray, drifting it along in clouds, and sprinkling it over the surface of the land."—Mr. DYER could confirm Prof. Way's remark on the value of salt on chalk soils. He had also found great benefit to his sheep from allowing them to have lumps of salt to lick.—Mr. BEALE BROWN had used equal quantities of salt and lime with advantage as a manure.—Mr. FISHER HOBBS had employed the refuse salt of the pilchard fisheries with much success. Some years ago it had attracted the attention of Dr. Paris (now President of the Royal College of Physicians), on account of its valuable properties in preventing rust in corn, a disease generally attributed to the varying changes of the atmosphere. It had been, Dr. Paris stated, the practice of many farmers in Cornwall to spread about 30 bushels of salt, the refuse of the pilchard fishery, weighing 56 lbs. each, per statute acre upon their land, a fortnight previous to the sowing of Turnips; and they all agreed that they never had any rust on the following crop of Wheat where this was adopted, though before they were greatly affected by it; a statement to which Mr. French Burke adds, that in the course of a very minute inquiry into the causes of rust, undertaken some years ago in this country, and afterwards continued at different periods on the Continent, it also appeared that it was never experienced in the immediate vicinity of the sea, unless when the ground was greatly over-manured; and also, that when sea-ooze or sand was employed as a manure, rust was prevented. Mr. Fisher Hobbs believes he was himself the first to introduce this fishery salt into the eastern counties, his attention having been drawn to it about four years ago by his friends, the Messrs. Bolitho, merchants, of Penzance, who informed him that this salt contained 10 per cent. of oil, and from 10 to 20 per cent. of scales and other fishy remains, and was greatly superior to common salt for agricultural purposes generally, but more especially for stiffening the straw of Barley. Mr. Hobbs being satisfied with the nature of the salt in question, and the oils and animal matter which it contained, that it must be superior to common salt, although not of higher price, at once ordered a cargo of it to Colchester, consisting of from 80 to 100 tons, and he had since that time had several similar cargoes for himself and his friends, through Mr. Purser, of New Bridge-street, Blackfriars, the manager of the London Manure Company. Mr. Fisher Hobbs had applied this salt to all his Wheat lands before sowing the grain, at the rate of 2 cwt. per acre, but at different times, namely, 1 cwt. before ploughing, and 1 cwt. after ploughing, but before depositing the seed. He had found this plan better than that of applying all the salt at once, as the salt became thus more intimately intermixed with the soil. He had tried 2 cwt. of guano per acre, mixed with the same quantity of the salt, as a dressing for Wheat, and found it very beneficial. He had also applied 2 cwt. per acre of the fishery salt, with farm-yard dung, for root crops—especially for Mangold-Wurzel and Cabbages—and found the mixture very effective. He knew an instance where 2 cwt. of the salt was last year used for Wheat, not far from the eastern coast of Essex, and the increase of produce obtained was 3 bushels per acre. Mr. Hobbs considered salt very beneficial for agricultural purposes, when judiciously applied, but injurious when used in excess. He gave an instance of such abuse in the case of his own bailiff, who, having on one occasion incautiously applied 5 cwt. per acre to his Turnips, entirely destroyed the crop. In reference to the use of salt in the case of animals, he remarked that while he preferred the fishy refuse for application to land, he used rock salt for all the live stock on his farm excepting pigs, for which he employed common household salt, boiled up with meal and Potatoes for their food. For his horses, cattle, and sheep, he invariably used rock salt with success; the two former had always free access to it in their mangers, and the sheep in their troughs. In wet weather the sheep would take a larger quantity of it than in dry weather. In a flock of 200, one-half of which had access to salt, while the other half were debarred from it, the losses among those which had no salt were found to be from 3 to 5 per cent. greater than among those which had salt, when feeding on green crops, or food of too succulent a nature. From some cases, however, which had occurred in his own experience, he was inclined to agree with Baron Mertens in believing that in the case of horses and cattle, as well as of sheep, the free use of salt had probably a tendency to produce abortion. He regarded salt generally as a stimulant and deobstruent, which purified the blood. In conclusion, he considered this subject well worthy of a distinct appointment for discussion at some future time; he should then be prepared to show the superior power of fish salt in destroying insects, compared with that of common salt.—Professor SIMONDS could bear testimony to the legitimate use of salt. He thought all the objections he had heard generally lay against the abuse of it, and in its being given in too large quantities to animals, or applied too freely to the land. On the contrary, while many plants were benefited by small quantities, others had so natural an appetite for such saline application, that it could not be given to them in excess. He instanced Seakale and Asparagus as plants of this kind. Salt in the animal economy had a great influence in promoting digestion and assimilation of the food. He agreed with Mr. Hobbs, that sheep fed on too luxuriant Grasses, without being at the same time supplied with salt, did badly. The salt corrected the injurious effect of the food, and promoted the secretion of bile. Salt marshes, he believed, never rotted sheep; while wet pastures and their coarse food invariably were found to do so. In the Royal Veterinary College the horses were constantly allowed to have a lump of salt by them; and when he was himself in country practice, he had salt sprinkled over the hay in the ricks, and found it very valuable for horses, sheep, and cows. He thought it a very important question for the consideration of the Council.—Mr. OVERMAN, as far as his experience had gone, could not agree with Professor Simonds in regarding the salting of hay a good practice; he had himself found it a bad one. He had found great advantage in allowing the horses to have it by them, to take it or not as they felt inclined, but not to force them to eat it with their hay. He thought it good as manure for land when applied in moderation. Farms in salt marshes had the heaviest crops of corn, and never, he believed, any mildew on them.—Dr. CALVERT considered salt in moderation as beneficial; it rendered herbage savoury to cattle, and prevented the decomposition of root crops. As long as the salt was not forced on the animals, but only laid in their way, instinct would direct them at what times to take it, and in what amount. Dr. Calvert referred to the avidity with which salt was sought for and relished by the natives of arid regions; and he especially alluded to the remarks of Mungo Park on this subject, in his "Travels in the Interior of Africa," where salt was highly prized, and when a lump of it was obtained it was sucked by the children of the torrid zone with as much eagerness as sugar-candy would be by the children of more genial and temperate climates. We may be allowed perhaps to quote two passages from the pages of that devoted traveller and ardent promoter of African civilization, in illustration of Dr. Calvert's reference to the point in question. In the second chapter of his narrative Mr. Park, in allusion to the articles of merchandise supplied by negro slave-merchants, and to the system of barter between them and the natives, remarks:—"In payment of these articles the maritime states supply the interior countries with salt—a scarce and valuable commodity, as I have frequently and painfully experienced in the course of my journey. Considerable quantities of this article, however, are also supplied to the inland natives by the Moors, who obtain it from the salt-pits in the Great Desert, and receive in return corn, cotton-cloth, and slaves." In his 24th chapter he further alludes to this scarcity and value of salt, in the following passage:—"In the interior countries the greatest of all luxuries is salt. It would appear strange to a European to see a child suck a piece of rock-salt as if it were sugar. This, however, I have frequently seen; although in the inland parts the poorer class of inhabitants are so very rarely indulged with this precious article, that to say, 'a man eats salt with his victuals' is the same as saying 'he is a rich man.' I have myself suffered great inconvenience from the scarcity of this article. The long use of vegetable food creates so painful a longing for salt that no words can sufficiently describe it." He thought the abuse of salt no argument against its legitimate use. It was a stimulant, and, as such, would promote digestion in animals.—The Chairman concurred with the members who had favoured the Council with the results of their experience, that a future discussion on this subject might prove of much importance.

The Council then adjourned to Wednesday, the 19th of March.

---

A WEEKLY COUNCIL was held at the Society's House in Hanover-square on Wednesday last, the 19th of March; present, Mr. RAYMOND BARKER, Vice-President, in the Chair; Lord Ashburton, Hon. R. H. Clive, M.P., Sir Charles Lemon, Bart., M.P., Don Domingo Savignon, Mr. Hodgson Barrow, M.P., Mr. Bastard, Rev. E. R. Benyon, Mr. Bosanquet, Mr. W. G. Cavendish, M.P., Mr. Dyer, Mr. Fisher Hobbs, Mr. Majendie, Mr. Marshall, M.P., Mr. Parish, Mr. Pendarves, M.P., Mr. Rowlandson, Mr. Sanford, Mr. Serjeantson, Prof. Sewell, Mr. Shelley, Prof. Simonds, Mr. A. Smith, Mr. Crompton Stansfield, M.P., Dr. Thomson, Mr. W. H. Walker, and Prof. Way.

The following new Members were elected:

Davy, Edward, the Park, Crediton, Devon
Alison, Henry, Park Hall, Chorley, Lancashire
Jones, Harvey Bowen, 49, Montagu-square, London.

The names of nine candidates for election at the next meeting were then read.

The Council having instructed the Secretary in what manner to acknowledge the communications then laid before them, and to what department respectively to refer them, adjourned, after a short sitting, to Wednesday next, the 26th of March.

---

## Farm Memoranda.

MR. HUDSON'S FARM AT CASTLEACRE.—I went some time since to Castleacre, to visit my friend Mr. Hudson, whose name and writings are well known in the agricultural world; and I need not say I met with a most kind, liberal, and unostentatious reception. It is 28 years since Mr. Hudson took the Castleacre farm, under Lord Leicester (then Mr. Coke), after having cancelled five years of the old lease, by which he lost 500*l*. His rent was then 1500*l*. per annum for 1400 acres. Seven years ago the lease was renewed for 21 years, at 1600*l*. per annum—a fair rent at that time; but when we consider that the saleable value of the estate has been increased by Mr. Hudson's industry and outlay to the extent of not less than 10,000*l*., it is to be presumed that he would get a renewal of his lease on liberal terms; or otherwise that he may, during the next seven years, endeavour to withdraw from the land some reasonable portion of the capital he has invested in it. Mr. Hudson referred to his books to show that during his tenancy he has laid out in oil-cake and artificial manures 55,000*l*. The oil-cake is laid on the land after passing through his cattle in the act of feeding them, but still it is money laid out in manure. This year his outlay is for 200 tons of Linseed-cake, at 6*l*. 10*s*. per ton, 1250*l*.; 56 tons of Peruvian guano, 560*l*.; nitrate of soda, sulphuretted bones, &c., about 400*l*. more; besides Egyptian Lentils, Indian corn, &c., &c., for feeding purposes. He is now feeding cattle as the quack advertisers would feed us, namely, on Revalenta arabica, which is said to be ground Egyptian Lentils, to the number of 160 beasts, besides 100 of lean stock and cows, all of which will be turned into cash by May-day. They are lodged in 11 straw-yards, with sheds all round the quadrangle, and all abundantly supplied with food and water. With the cattle associate a good many growing pigs, which are quick enough to pick up a living amongst their betters. Mr. Hudson is preparing three beautiful Devon oxen for the Smithfield show. They appear small animals, but of excellent form and quality, and the fattest one is estimated to weigh 90 score, which at 6*d*. per lb.

is 45*l.*; and if he obtained a 20*l.* prize the ox will pay well. The mangers these animals feed from have slate bottoms, which are both clean and very durable. Mr. Hudson has 2700 sheep, 2500 of which, after their fleeces are off, will be sold in Smithfield before Midsummer, the breeding ewes being retained. The wool will all be sold before Christmas, 1851, Mr. Hudson making it a point to adopt the commercial maxim of selling all he makes, whether it be beef, mutton, pork, corn, or wool, before his annual stock-taking. From about the end of November he sends about 150 quarters of grain to market weekly, until all is sold. His land sown and sowing with Wheat this year is 500 acres, in fields of 35, 40, and 50 acres each, and in each field the crop is stacked on circular bottoms and iron posts two feet high and three feet apart. His circular stacks are 27 feet in diameter at the bottom; of symmetrical form, and beautifully trimmed. His Barley stacks are oblong, 60 feet long by 20 feet wide, and not on raised bottoms; so that the rats, poor things! are kept on Barley instead of Wheat. Mr. Hudson paid 2950*l.* in wages in 1849, and 2700*l.* in 1850, and usually receives from 8000*l* to 10,000*l.* per annum from Smithfield market, according to the price of meat, now considerably less, the price of meat being too low to pay. He has put on his Turnip land this year 3000 tons of yard manure, and on his Wheat land 2000 tons; besides guano, bones, and other things. When I visited him, they were ploughing a little field of 35 acres with four pairs of oxen; and as they finished a ridge, six or eight feet wide, and while the mould was fresh and moist, the seed-drill followed; and after the drill came the harrow to finish with—the three operations all going on together. I asked "What crop had you on this last?" "Turnips." "When did they come off?" "Yesterday. We hauled off half, and fed off the other half with sheep, and they finished their feed yesterday. We never let the land lie—we plough and sow directly we get the Turnips away." "Well, but where are the weeds?" "There are none, the Turnips are kept perfectly clean. The same principle is adopted in Turnip sowing, we put in the seed instantly the plough has passed over it." Mr. Hudson uses Howard's (of Bedford) patent plough. He bought a dozen of them four years ago at 4*l.* 15*s.* each. His dibbling machines cost 60*l.* each. He has six road waggons, 18 Gloucestershire harvest waggons, 12 two-horse tumbrils with iron bottoms; four light Gloucestershire waggons for hay and light work, and a few one-horse carts—all made on the premises. His saddlery and harness are all required on the premises. All his blacksmith's work and carpentry is done on the premises. And one of his steam-engines was made at home. This is all so different from the extent and routine of an ordinary Cumberland farm, that you may think I am romancing, but you must come and see, and then you will believe. Mr. Hudson has two stationary steam engines, of 12 horse power each, on different parts of the farm; and he finds they are not sufficient for his work, and is building a third. The castings are made in the village; and his engineer and blacksmith, with their forges and lathes, put them together. One of the engines was at work threshing Barley, two men were on the stacks, two loading the waggons, and two pitching from the waggons to the engine, another receiving the grain in swills, from which he returned it into another whirligig to have the beards broken off. The straw came out at another place, and was pitched away; and a cloud of chaff and dust showed where the winnowing was going on. The same engine was, at the same time, pumping water, grinding Revalenta arabica, and breaking oil-cake. The same machine also presses linseed for extracting the oil, which is put into large wine pipes and sent to America for sale, and the cake goes to feed the cattle. There is also attached a flour mill, as well as a Barley-flour mill, for grinding the refuse corn, Beans, &c., for feeding purposes; a saw mill, and other conveniences. The cart-wheel felloes are cut out in segments by the machinery of the engine, and much other work done by steam agency. Mr. Hudson has 40 work horses and 18 working bullocks. The latter work double (? half) shifts, viz., two oxen in a plough—he keeps four ploughs at work 10 hours a day, and they plough from one and a quarter to one and a half acres daily each plough. The straw is cut into chaff; the Turnips are sliced, and other roots are cut by the steam machinery. Mr. Hudson has two suits of clothes, one fine and the other coarse, and his wife has a beautiful shawl, all of their own wool. As for a Thistle growing on the farm, you might safely offer a guinea for it; and the land is, for 1400 acres, like a garden. Women and boys are constantly employed picking up every stray weed, and sometimes they contract for it by the acre. Altogether, the farm, the farmer, and the style of farming, is such as few Cumberland farmers can have any idea of. *A Farmer in the Cumberland Pacquet.*

## Miscellaneous.

*Mr. Mechi and the Poor.*—Mr. Mechi, with those feelings of philanthropy which characterise him, and a liberality we wish every other farmer was in a condition to imitate, has been showing himself thoughtful of the poor, not by acts of indiscriminate charity, but the true benevolence of furnishing those who would otherwise have stood unwillingly idle, with a winter's employment, feeling that it is thus the security of property, of which he boasted at his gathering, and the singular exemption which the once notorious Tiptree Heath now enjoys from criminal commitments can be best maintained. Ordinarily Mr. M. employs 19 men and boys regularly upon his farm, and he has now set on 55 additional men, consisting of the unemployed of the neighbouring parishes, and has engaged them in digging and breaking up with the fork and pickaxe, to the depth of about 20 inches, the rocky iron-bound and macadamised subsoil of his light land. The price paid is 9*d.* per rod, or 6*l.* per acre. Whether the operation will stand the test of the balance sheet remains to be proved; certainly no manure could cause crops to be maturely developed on those soils in a dry season. *From the Chelmsford Chronicle.*

METEOROLOGICAL REPORT.—March.
(*Continued from page* 173.)

* A storm crossing England from west to east, but probably lying a long way off to the northward.

† A storm coming from the south and westward, and curving across England and Scotland, to the eastward; probably passing by Copenhagen, up the Baltic.

‡ This storm crossed southern England, and, as I conjecture, went over France; but it was probably of small diameter, and at a very considerable altitude, being an upper current, and the precursor of the succeeding storm.

§ This storm came from south, probably up the Irish Channel, and crossed England to the eastward; on Monday afternoon I travelled through the centre of it from London to Dorchester, being most palpably in the storm's eye, with a bright sky over and around us, with a continuous low dark horizon on every side, of clouds slowly wheeling round us as on a pivot.

‖ At 5 p.m. of the 11th, whilst the upper scud was still travelling from north-west, the wind changed, and a heavy bank crept along from south of west. This was a storm's-eye crossing the south of England, and going away to the eastward.

¶ A storm coming from the Bay of Biscay, passing over Normandy and the British Channel.

** A storm coming from the westward, and crossing England to the eastward.

Dorchester, March 19th. *F. P. B. M.*

(*To be continued.*)

## Calendar of Operations.

MARCH.

Dorset Farm.—We have now finished Barley sowing, under the most favourable circumstances; for the weather has hitherto been all that could be wished. We had a great quantity of rain during the winter, but it cleared away so moderately that the land did not suffer at all, as it sometimes does from succeeding drought; and every description of work is well advanced. We have still a piece of Rape to eat off, and are to sow Oats after it, which we will have done this month. The Rape was sown last season, before the Turnips were put in, and is now being fed off a second time by the chilver hogs (year-old ewes), as it is very strong; and to prevent a tendency which it had to scour, we have it cut off two or three days before it is eaten, and the effect is very good, as the sheep eat it better; and being cut off close to the ground, the ploughing can be much better done, while the sheep thrive very well. I believe, that like most other vegetables, when it is a little withered, it is deprived of its acrid taste, and rendered more palatable to the animals. We are now getting out our dung, so that it may lie in heaps in the fields, and get a little rotted before the Turnip season commences; as, at that time, we like to get over the work as quickly as possible; for it is too often the case, that Turnips are a poor crop, from not being put in in the proper time; and often for the sake of a few Vetches, which might be done without. We should never, under ordinary circumstances, delay the last sowing longer than the end of June. We shall now be putting in our Grass seeds, which we shall harrow in, but the Clover will not be put in for some time, as we only roll it; and if sown early, it has a chance of being destroyed by frost. *G. S.*

## Notices to Correspondents.

Beans: *J S.* Soot and salt or soot and wood-ashes—30 bushels of the soot with 2 cwt. of salt or 10 cwt. of wood-ashes will be a good dressing.

Chicory: *Constant Reader.* You will see some information on this subject at page 154.

Grass by Inoculation: *Stocktoniensis.* You will, if the sward is good, find your plan the best and easiest way of laying the land down. You should cut the field in strips by a roller armed for the purpose, about 6 inches wide, and then pare it the other way. After the arable field is properly prepared, get the bits of Grass gathered in carts and spread over it. Employ children to *place* them right side up, and tread on them. Then roll the field, spread a compost, sow some Grass seeds, bush-harrow, and roll again.

Grass Lands: *Festuca Elatior.* You may scarify and harrow the field and sow Grass seeds, and bush-harrow and roll, with every probability of getting a better covering.

Liquid Manure: *Sub.* If you intend adding 1 cwt. of guano per acre in a liquid form after every cutting of Italian Rye-grass, then just see, in the first place, what quantity of water your machine distributes per acre, and mix the cwt. with that quantity. Probably 300 or 400 gallons will be the quantity to mix the dressing of guano, whatever you may fix on per acre.

Manure: *Owen Glendower.* We should put all our manure on the green crop and none to the grain. The bones and superphosphate with the manure should all go to the green crop. Lime is best added on the corn or Clover stubble before the winter's furrow. The Clover stubble is probably the better of the two.

Mr. Moody's Turnip-crusher: *Cirencester.* Mr. E. J. Moody, jun., Maiden Bradley, near Mere, Wilts.

Paint: *Y Z* begs to acquaint "M. B.," who makes the inquiry in the last Paper, as to a thorough good paint for out-door work, that from the experience of many years, none comes up to Carson's; and recommends the sending to 9, Great Winchester-street, Old Broad-street, London, for the testimonials.

Peat Compression: *W W B.* You will probably obtain information on this subject by applying to Mr. Clyburn, Ratcliffe Iron Works, 55, St. George's-street East, London.

Poultry Books: *Argo.* You must consult our review column in past numbers. Mr. Dixon's work on ornamental poultry contains information on the subject you name.

Spanish Fowls: *W H.* The hen of thorough-bred birds is not expected to have a white *face*, though it is now the fashion to make it a *sine qua non* with the cocks.

Sundries: *A B.* Rape-cake is, we doubt not, imported both into London and Hull. You should apply to any corn factor. Barley may be given whole to sheep. Rape must not be sown with Oats, however late; you will be in a mess at harvest-time if you do. Sow it in a seed bed, and transplant it on to the stubble as soon as it has been worked over; you will then have a good bite next spring.

The Hydatid: ?. The specimen sent appears, as far as we can judge, the membranous investment of an hydatid, the contents of which might have escaped. The cause of the symptoms is no doubt hydatids on the brain. If so near the surface as to cause the skull to appear soft, it may be pierced with a small awl, or the skull may be trephined; and then, if there is no other, the animal will recover. If situated deep in the brain, there is no remedy. The best advice is to confine the animal, and force it on for the butcher by nutritious food. *W. C. S.*

## Markets.

COVENT GARDEN, March 22.

Good Pine-apples are somewhat scarce, and dessert Pears are nearly over for this season. Apples are also scarce. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. A few forced Strawberries have made their appearance. Vegetables of all kinds are abundant and good. French Beans and Cucumbers are now plentifully supplied. Carrots and Turnips are good in quality. Potatoes are a trifle dearer. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1s. 3d. per pottle. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Double Primroses, Stephanotis floribunda, Cinerarias, Moss and Provins Roses, and the different kinds of spring bulbs.

SMITHFIELD, MONDAY, March 17.

The supply of Beasts is smaller; in consequence prices are rather better; trade, however, is not brisk, and the advance is not freely given. The number of Sheep is about the same as of late. We cannot quote higher, although for a few choice Downs rather more money is given. Trade is very heavy for Calves at lower prices. From Holland and Germany there are 429 Beasts, 1110 Sheep, and 71 Calves; from Norfolk and Suffolk, 2400 Beasts; and from Scotland, 260.

| Per st. of 8 lbs. | s | d | s | d | Per st. of 8 lbs. | s | d | s | d |
|---|---|---|---|---|---|---|---|---|---|

| | | | | | Pigs | ... | 2 | 8 — 3 | 6 |

Beasts, 3594; Sheep and Lambs, 18,820; Calves, 120; Pigs, 280.

FRIDAY, March 21.

The number of Beasts is small, but quite sufficient. Monday's top quotations are realised only for choice qualities, which are not plentiful. The supply of Sheep is tolerably good for the time of year; choice kinds make as much as of late, but other kinds are rather lower. Trade is dull for Calves, and only in a few instances higher prices are made. From Germany and Holland we have 44 Beasts, 290 Sheep, and 131 Calves; from Scotland, 40 Beasts; and 80 milch cows from the home counties.

Beasts, 657; Sheep and Lambs, 3000; Calves, 208; Pigs, 350.

MARK LANE.

MONDAY, MARCH 17.—The supply of English Wheat to this morning's market was small; the fine dry qualities were disposed of at an advance of 1s. per qr., but no improvement could be established on the out-of-conditioned parcels. There was some inquiry for foreign, but buyers being influenced by the large arrivals, were only inclined to purchase at a reduction, which not being acceded to by the sellers, little business was transacted.—Barley of all descriptions is held firmly.—Beans are unaltered in value.—White Peas are quite unsaleable, but we cannot vary our quotations.—Oats meet a fair inquiry, and in some instances command a slight advance.—We observe no alteration in Flour.

FRIDAY, March 21.—The arrivals of English grain this week have been small, of foreign moderate; to-day's market was not largely attended, and the inquiry for Wheat less active than on Wednesday, but it is held firmly.—Barley and Oats command our extreme quotations.—The value of Beans and Peas is unaltered.—Flour meets an improved demand without leading to an increase in business.—Polish Odessa Wheat afloat is scarce, and held for an advance of 1s. to 2s. per qr.; say 35s. to 36s. per qr., cost freight, and insurance.—Since the 14th the tone of the Wheat trade has decidedly improved, and in many instances a slight advance upon the previous low rates was realised in markets on the coast, as well as agricultural.—Spring Corn has also commanded more attention; fine malting Barley is sought after.

LIVERPOOL, TUESDAY, MARCH 18.—The arrivals of grain and Flour this week are upon a much less scale than of late. The foreign Wheat is mostly of the lower description. There has been more buoyancy in our trade during the week. Higher rates generally were required at the beginning of business at our Corn Exchange this morning. The millers and dealers were reluctant to accede to these, but ultimately a fair extent of transactions occurred in Wheat, at an advance of 1d. per bushel, and in some cases 2d. on the price of this day week. The best Oats were also 1d. per bushel higher. In Flour and Oatmeal there was about the usual amount of business, at very full prices. English Beans improved 6d. per qr. Indian Corn was also 1d. to 2d. per qr. dearer than last Tuesday, and a fair extent of sales was made for shipment to Ireland. —FRIDAY, March 14.—The supplies of Wheat, Flour, Beans, and Oatmeal since Tuesday have been liberal, and at the same time we have to remark a retrograde feeling in the trade generally. At this morning's market Wheat and Flour were in moderate request, at full prices. Oats and Oatmeal supported late rates. Barley, Beans, and Peas were without change. Indian Corn was in fair request for shipment to Ireland, and purchases not so easy to make as on Tuesday, but there was no quotable change in prices.

GRASS SEEDS.

FINEST LAWN GRASS SEEDS, perfectly free from Weeds and coarse Grasses, 21s. per bushel, 3s. per gallon, or 1s. 3d. per pound, with instructions.

To insure a pure Turf of finest Dwarf Grasses, Messrs. SUTTON strongly recommend the sowing the above Seeds, whereby the great expense of cutting, carting, and laying Turves may be avoided.

PERMANENT PASTURE GRASSES,

*Mixed expressly to suit the soil for which they are required, at the reduced prices of 22s. 6d. to 28s. per acre, viz.:*

| | £ | s. | d. |
|---|---|---|---|
| BEST MIXTURES for laying down Land to permanent Meadow or Upland Pasture, per acre ... | 1 | 8 | 0 |
| DITTO, for laying down Reclaimed Marshes and Common Inclosures, per acre ... ... ... ... | 1 | 2 | 6 |
| DITTO, for fine Park Lands near Mansions, per acre | 1 | 15 | 0 |
| DITTO for Irrigation or Water Meadow, per acre ... | 1 | 6 | 0 |

SUTTON'S RENOVATING MIXTURE, consisting of Perennial Clovers and fine Grasses, for improving old Parks, Meadows, and Upland Pastures.

JOHN SUTTON and SONS having reduced the price of these Seeds 25 per cent., viz., to 10d. per lb., or 1s. 6d. per gallon, great improvement in Pastures, &c., may be effected at a small cost, by the application of 6 or 8 lbs. per acre, sown immediately upon the old Turf.

We are almost daily receiving unsolicited the most gratifying letters from our customers, in praise of our Seeds; and though we refrain from *publishing names* unnecessarily, we have much satisfaction in quoting the following:—

*From a Member of the Council of the Royal Agricultural Society.*

"Messrs. SUTTON,—I was particularly pleased with your Grass Seed, which I employed by itself, for laying down some fresh broken-up Land. It became a close fine sward by August. I have now about 30 acres of land to sow immediately, &c., &c., and shall be glad of your advice for the purpose."

*From the Land Steward at a large Estate in Hampshire.*

"All the kinds of Grasses sown separately grew admirably; and the 20 acres of Park laid down with *your Mixture* last spring is most excellent. We are anticipating a large crop of Hay, and I can see by the various habits and successional growths of the several kinds, that we shall always have a fresh growing bite for the cattle after the Hay is cut. The Clovers too I see are plentiful."

*From a Clergyman, an eminent Agriculturist and Member of the Royal Agricultural Society.*

"I have had the pleasure of praising your Seeds in many quarters beside that to which you refer. This I have done from a sense of justice only."

Another Clergyman writes us—"My Turnip crops are the admiration of all the farmers round, especially the Swedes and your Purple-topped Hybrid. I hope you have some of the same kind this year, as I am certain the superiority in my crops is mainly owing to the stocks."

*The above are similar to hundreds of others.*

N.B.—Instructions for Sowing accompany every parcel of Grass Seeds; and any other information required by post will be promptly given.

*Goods delivered free of carriage to any Office in London, Bristol, Gloucester, Exeter, Southampton, &c.*

Reading, Berks, March 22.

GRASS AND OTHER SEEDS.

THOMAS GIBBS AND CO., the Seedsmen to the "Royal Agricultural Society of England," corner of **Half Moon-street**, Piccadilly, beg to call the attention of their friends to the following Seeds:

Mixtures of selected Natural Grasses for laying down Land to permanent Meadows and Pastures, apportioned to suit the nature of the soil.
Mixtures for portions of Parks near Mansions.
Mixtures for Garden Lawns and Grass Plots.
Mixtures for renovating Old Pasture Land.
Italian, and other Rye-grasses.
White Belgian and Red Altringham Carrots.
Gibbs' new very large Parsnip.
Orange Globe Mangold Wurzel.
Long Red and other kinds.
Drumhead and Thousand-headed Cabbages.
Swedes, Hybrids, and other Turnips.
Clovers, Kohl Rabi, French and English Furze.
Sainfoin, Rape, Tares, White Mustard, and all Agricultural and Kitchen Garden Seeds, &c.

Priced Lists are now ready, and will be forwarded free, on application, by post, or otherwise, to corner of **Half Moon-street**, Piccadilly, London.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND CO. beg to notice their mixtures of GRASS SEEDS for Laying Land down to Permanent Grass, are now ready for delivery. They have reduced the price to 30s. per acre, allowing 2 bushels 12 lbs. to the acre.

Mixed sorts for improving old Grass Land, 1s. 2d. per lb.

Fine sorts, for forming Lawns, 1s. 3d. per lb. Directions for sowing will accompany the Seeds.

GEORGE GIBBS and Co. will feel happy in sending general priced Catalogues of Agricultural and Garden Seeds, on application to 26, DOWN-STREET, Piccadilly, London.

GRASS SEEDS FOR LAYING DOWN PERMANENT PASTURE.

W. DRUMMOND AND SONS, SEEDSMEN, Stirling, N.B., having been among the first to recommend the use of the NATURAL GRASSES in the formation of PERMANENT PASTURE, the subject has occupied a large share of their attention. They have carefully noted the species composing the best Natural Pastures, and the results of combinations in culture under varied circumstances of soil and situation; and, as the result of their observation, as well as from the great satisfaction their selections have given, they feel warranted in recommending, in addition to the Grasses usually sown, a variety of such species as are known, not only to yield the greatest bulk of herbage, but the largest amount of milking and feeding properties, varying those species, and the proportions of each, according to the nature of the land to be laid down; and from the low price of their Seeds this season, the expense is not materially increased. The very best Mixture they can give for PERMANENT PASTURE or MEADOW will not exceed 28s. to 22s. per statute acre. The quantity of each variety comprising the Mixture is given in detail with each parcel.

With every other description of FARM SEEDS, priced Lists of which may be had free on application.

N.B.—Seeds are delivered, *carriage paid*, to most of the principal Shipping Ports and Railway Stations throughout the Kingdom.—Agricultural Museum, Stirling, N.B.

PERMANENT PASTURE.

HENRY ROGER SMITHE, of Eastling, Faversham, Kent, informs the Public that his mixtures of the Natural Grasses and small Clovers—excluding no sort which is proper to form a PERMANENT PASTURE, as the soil &c. may direct—are now ready; delivered on the railway free of charge, at 1l. per acre, allowing 3 bushels as seed for an acre; also Lawn Mixtures, and the sorts separate. They are gathered under his immediate superintendence, and are quite new; this unprecedented low price last year, and the prospects of agriculture, having created an unlooked-for demand.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2d. to 3d. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES; AND PLATE GLASS FOR DWELLINGS.

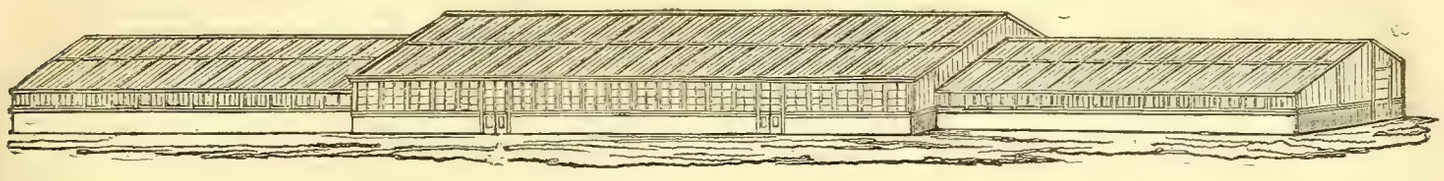
Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovelers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.



LINGHAM BROTHERS, 170, Hampton-street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MENOGRAPH, or Label for Garden Borders, Flower-pots, &c., in boxes of 100, &c. The Zinc Labels are highly approved of for their lasting durability; can be written upon with the greatest ease, and, when dry, a permanent inscription is secured. Directions for use sent with each box, including bottle of Metallic Ink.

Sole Agents in London, G. and J. DEANE, Horticultural Implement Warehouse, 46, King William-street, London Bridge.

# GRAY AND ORMSON,

## DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[Erected for John Shaw Leigh, Esq., Luton Hoo.]

Extract of a Letter from Mr. Fraser.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, John Shaw Leigh, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "James Fraser, Gardener, Luton Hoo Park."

---

WARWICKSHIRE.

SALE BY AUCTION AT THE HILL-FIELD FARM, COMBE, On MONDAY, the 31st of March, and TUESDAY, the 1st of April, 1851 (instead of the 2d and 3d of April, as before announced).

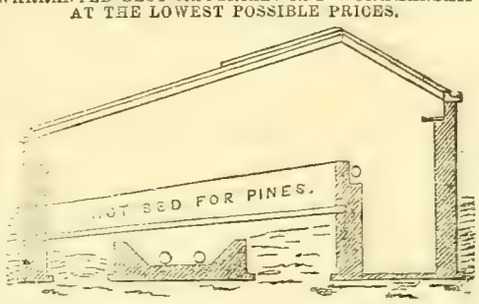
MESSRS. BROWN and CLARKE are honoured with instructions from the Right Hon. the Earl of Craven, to submit to SALE BY AUCTION, at the time and place above named, his entire herd of thorough-bred short-horned Beast, of all ages. Dairy and other Beasts, not thorough-bred; near 600 Sheep, 15 Draught Horses, Implements, &c., as follows, viz.: First Day, March 31, 1851.—319 Leicester Ewes and Theaves, in Lamb or with Lambs. 175 Ewe, Wether, and Tup Tegs. 79 Fat Shearhogs. 22 Shearhogs and 2 Shear Tups. Implements, consisting of, in part, Seven Waggons, Six Carts, Six Ploughs, Seven Sets of Harrow Scuffles, Four Wood and Iron Field Rolls, Three Chaff Machines, Two Winnowing Machines, Horse Hoes, Turnip Drills, and the usual Implements for an Arable Farm; Timber Waggon and Wheels, Timber Ropes and Pulleys, Ditto Chains, Dairy Utensils. Also 5 large ricks of well-harvested Wheat and Beans. Second Day's Sale, April 1, 1851.—26 thorough-bred Short-horned Cows, Heifers, Sticks, Yearlings, and Calves; 6 ditto bull Calves; 1 ditto Bull, 20 months old; 1 ditto ditto, rising 4 years old; 17 Dairy Cows and Calves, not thorough-bred; 21 fresh three-year-old Shropshire Steers; 17 Sturck-Steers, and Heifers; 15 powerful and handsome Waggon Horses, and Gears; 26 Pigs, some of which are of Mr. Fisher Hobbs' celebrated breed. And, by permission, will be offered a handsome Bay Mare, a good Nag and perfect Gigster; a Grey ditto; a four-wheeled Phaeton, and a Gig and Harness, the property of Mr. Large. Catalogues, with pedigree and particulars, are ready, and can be had of Mr. Large, at the farm; of the Auctioneers, Coventry; or forwarded by post, on application. Luncheon at half-past 10 o'clock, and the Sale to commence punctually at half-past 11.—The Hill Field Farm is situate 4 miles from Coventry, 3 miles from Brandon, on the North-Western Railway, and 3 miles from the Shelton station, on the Trent Valley Railway.

---

NORTHAW, HERTS.

TO BE LET, from Michaelmas, 1851, NYN FARM, situate at Northaw, comprising an excellent Farm-house, with convenient Outbuildings, and 220 acres of Land of which about 82 are Arable, and 138 Meadow Pasture and Homestead. The Farm is wholly exempt from tithes or tithe rent-charges, and the parochial rates are very moderate. Northaw is situate near to Potter's Bar, on the line of the Great Northern Railway, four miles from Barnet and Hatfield, six from Cheshunt, and nine from Hertford. To view the Farm, apply to Mr. James Dredge, Northaw; and for particulars, and to treat for the same, to Messrs. Attwood and Rigden, the Close, Salisbury.

---



FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

---

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS and CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. Weeks and Co., King's-road, Chelsea, London.

---

TANNED NETTING for the Protection of Fruit Trees, and for the security of fresh-sown Seed from Birds, at unprecedented low prices; viz., 1*d.* per square yard, 200 yards for 14*s.*, 600 yards for 30*s.*, or 1000 yards for 50*s.*; Bunting and Scrim Canvass for Wall Fruit—at Thomas Edgington and Co.'s. Marquees, Tents, and temporary Ball Rooms fitted up in a superb style, in town or country, on sale or hire. Marquees for Emigrants. Rout Seats and Dancing Hollands for evening parties, on hire; Flags, Banners, Tulip Covers, Sun Blinds, and improved Waggon and Rick Cloths. Tarpaulings for houses under repair, on hire, at Thomas Edgington and Co.'s Warehouse, 17, Smithfield-bars, City, and Manufactory, nearly opposite the Bricklayers' Arms, Old Kent-road.

Orders per post punctually attended to.

---

NETTING, FLAGS, AND BUNTING.—Tanned Garden Netting, for protecting Fruit Trees from Frost Blight or Birds; or as a Fence for Fowls, Pigeons, Tulip and Seed-beds, can be had in any quantity from John King Farlow's Fishing-rod and Net Manufactory, 5, Crooked-lane, London-bridge, at 1½*d.*, 1 yard wide, 3*d.* 2 yards, or 6*d.*, 4 yards wide. Woollen Bunting, any length or width, at 6*d.* per square yard. Forwarded to any part of the kingdom on receipt of remittance, Post-office order, or stamps. Several good second-hand Flags to be sold cheap.

---

HALL'S GARDEN NETS, of superior lightness and strength.—These Nets are found to be a good protection against Frost, Hail, and Wind; also from Wasps and Insects. They are of great width, and very durable. Also valuable as outside shades to Greenhouses, &c.

Nos. 1 and 2, 56 inches wide ... ... 6*d.* per yard.
No. 3, 56 inches wide, close shelter ... 8*d.* „
No. 4, „ „ thread leno ... 8*d.* „

P.S.—It will be observed that No. 1 Net, of which there is the largest consumption, is only 4*d.* the square yard, or rather less. All the Nets are 56 inches wide, and so made that two breadths can easily be joined.

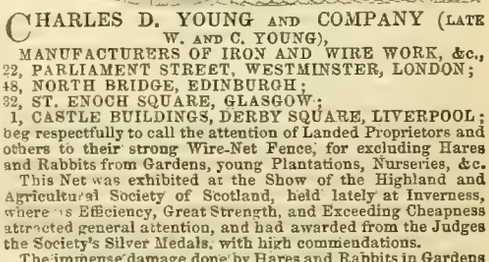
---

THE HIPPOPOTAMUS, presented to the ZOOLOGICAL SOCIETY by H.H. the Viceroy of Egypt, is Exhibited daily at their Gardens, in the Regent's Park, from 11 to 4 o'clock. Visitors desirous of seeing the Animal in the water are recommended to go early.

Admission, One Shilling; on Mondays, Sixpence.

---

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.



| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24-inch wide | ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch „ strong „ | ... | 9 „ | 6½ „ |
| 2-inch „ extra strong „ | ... | 12 „ | 9 „ |
| ¾-inch „ light „ | ... | 8 „ | 6 „ |
| 1½-inch „ strong „ | ... | 10 „ | 8 „ |
| 1½-inch „ extra strong „ | ... | 14 „ | 11 „ |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

---

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG and COMPANY (late W. and C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

Prices.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

| | | | |
|---|---|---|---|
| Or a web of 100 yards, 18 ins. wide, will cost | .. | £3 | 15 0 |
| Do. of 100 yards, 24 ins. wide | .. .. | 5 | 0 0 |
| Do. of 100 yards, 30 ins. wide | .. .. | 6 | 5 0 |
| Do. of 100 yards, 36 ins. wide | .. .. | 7 | 10 0 |

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. Young and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. Young & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

CHOICE AND BEAUTIFUL FLOWER SEEDS.

J. C.'s Descriptive Priced Catalogues of Vegetable and Flower Seeds, may be had on application, or if by post, by enclosing two penny stamps.

SNOW'S "CHAMPION" HYBRID GREEN COS LETTUCE.

J. CHARTRES begs to offer the above, which he considers really to merit Mr. Snow's description of it (verbatim):—"The best kind known for summer and autumn use, hearts well, requires no tying to blanch it, good size, beautifully crisp," &c. 1s. per packet.

T. C. takes this opportunity to state, that he has a very choice collection of imported German Seeds, Stocks, Asters, Zinnias, &c., which have previously given such great satisfaction. A Catalogue can be had on application, postage free.

74, King William-street, City, London, March 22.

THE BLACK AUSTRIAN PINE (PINUS AUSTRIACA).

LUCOMBE, PINCE, AND CO., have a large and healthy stock of this most desirable Pine, from 9 inches to 3 feet high, which having been frequently transplanted, are well-rooted and safe to remove: they can offer them, varying according to age and quality, from 20s., 40s., to 60s. per 1000. This Pine has been proved to thrive in bleak and exposed places, and in the poorest soils, growing rapidly, and producing dense shelter in places where other trees will not grow; it also thrives well close to the sea, resisting the spray and roughest winds. N.B. The present is a very fine time for planting.

Exeter Nursery, March, 22.

FLORISTS' FLOWERS, SEEDS, AND BOOKS.

CAREY TYSO, FLORIST, &c., Wallingford, Berks., begs to offer, of best quality, as under.

TREATISE on the RANUNCULUS, 6d., post free 8d.
TREATISE on the ANEMONE, 3d., post free 4d.
IMPORTED FLOWER SEEDS.—German Asters, Stocks, Zinnias, Hollyhocks, Poppies, Salpiglossis, &c., each 1s. and 2s. 6d. per named assortment, postage free. ANNUALS, 25 fine varieties, post free, 5s. Catalogues 2d.

NEW AND CHOICE FLOWER SEEDS, GERMAN STOCKS, GERMAN ASTERS, &c.

J. C. WHEELER AND SON, NURSERYMEN and SEEDSMEN, by Official Appointment, to the Gloucestershire Agricultural Association, 99, Northgate-street, Gloucester, have selected, out of a large collection of Flower Seeds, 20 of the most beautiful and showy varieties, each sort distinct in colour, and calculated to produce a fine effect when planted out in beds or groups in the flower border. Each variety is distinctly marked with its Botanical and English name, height, time of flowering, colour of the flower, manner of growing, whether erect or trailing, &c., &c., the time it should be sown, and other valuable hints as to its cultivation. In selecting these 20 varieties, care has been taken to exclude all which are shy-bloomers, or have an insignificant appearance; so that the collection will comprise only those which are really showy and handsome, and which, it is believed, would prove to the entire satisfaction of any lady or gentleman who might be disposed to order them. The German Stocks and Asters especially are most superb.—The 20 Packets are neatly packed up in one paper, and will be sent free by post, to any part of the Kingdom, for 5s.

BLACK BARBAROSSA GRAPE.—Fine flavoured GRAPES may be obtained until April, by growing the above truly magnificent variety, introduced from the Continent by C. T. WARD, Esq. For further particulars, see *Gardeners' Chronicle*, March 8, 1851. Good Plants from Eyes may be obtained of JOHN BUTCHER, Nurseryman, Stratford-on-Avon, 10s. 6d. each. London Agent, Mr. F. WARNER, Seed Merchant, 28, Cornhill.

TO MARKET GARDENERS.

SPRING COLLETS. — About 60,000 SPRING CABBAGES, autumn planted, to be Sold, now growing without a fault, on two acres of good loam, near a Railway Station. — Apply to WILLIAM NEWTON, Wraysbury Station, Staines (if by letter, post paid).

BEAUTIFUL FLOWERS.—FLOWER SEEDS, hardy, half-hardy, and perennials, forwarded free by post, at the following low prices, all warranted:—100 packets, 5s.; 70, 4s.; 50, 3s.; 30, 2s. 6d.; or 12 for 1s.; tender annuals at 2s. 6d. per dozen packets; garden seeds in packages, at 5s., 10s., and 20s. each, containing nearly double the usual quantities, sent out, and all of the best kinds in cultivation. A few packets of extra fine Balsam seeds at 1s.; Cucumber and Melon seed, 6d. a packet. List, with sample packet, for two stamps. Address JOSEPH GOLDING, Seedsman, Hastings.

A NEW STRIPED AZALEA.—On Tuesday, April 1st, we intend exhibiting, with other new plants, at the rooms of the Horticultural Society, 21, Regent-street, a NEW AZALEA, introduced by us from China. It blooms freely; its flowers are very fine, striped with purple on a white ground. The kind is unlike any other in cultivation, and will prove highly interesting to all lovers of flowers.—STANDISH and NOBLE, Bagshot, Surrey.

ROSES IN BLOOM.

TO BE SOLD OR LENT, 12 First-rate Perpetual Roses in 13-inch pots, carrying about 200 head of Bloom, or the Bloom will be sold as they open; they will move well, having been grown slowly.—Apply to W. TURNER, Tufnell-park, Holloway, London.

PURVEYOR TO HER MAJESTY, AND THE KING OF THE NETHERLANDS.

JOHN BAILY, 113, Mount-street, Grosvenor-square, London, Dealer in all sorts of useful and ornamental Poultry, Wild and Tame Pheasants, Domesticated Wild Fowl, Fancy Fowls' eggs for setting. BAILY'S Registered Poultry and Pheasant Fountain, to ensure a constant supply of clean water for Gallinaceous Birds, especially adapted for Chickens, Pheasants, Poults, Pigeons, &c.: by its use, many of the diseases to which these birds are subject are avoided, as, although there is an ample supply of water, they cannot get into it. 14 quarts, 17s. 6d.; 7 quarts, 15s. 6d.; 3 quarts, 13s. 6d. Particulars, with a drawing, forwarded, per post, on application.

MONTHLY STORY FOR YOUNG PEOPLE. By the Editors of the "Family Economist."

STORIES FOR SUMMER DAYS AND WINTER NIGHTS.

These well-writ en and beautiful stories will be found more acceptable in many respects for the monthly reading of the young than any Magazine, and equally interesting to readers of older growth. They are lively, instructive, and moral; adapted to entertain and improve—to inform the mind and educate the heart. Each story is illustrated with well-executed engravings. They are among the best and cheapest books for young people published. Already published—I. The Sea Kings. II. Madeline Tube, and her Blind Brother. III. The Young Emigrants. IV. The Boy and the Book. The above are now ready, in one volume, elegant binding, price 1s.; or separately, 3d. each. OSCAR, a tale of Norway, will be published 1st of April. London: GROOMBRIDGE and SONS, Paternoster-row, and sold by all Booksellers.

Price 1l. 11s. 6d., imperial 8vo,

THE ROSE GARDEN. By WILLIAM PAUL. The work is embellished with 15 highly-finished Coloured Drawings by ANDREWS, MAUBERT, and WAKELING; and numerous Wood Engravings.

"Any Amateur who will procure PAUL'S 'ROSE GARDEN' will make his course clear for the successful cultivation of this beautiful Flower, and soon have all that it costs him in the certainty of his operations."—*Gardeners' Chronicle*.

"The important subject of Pruning is handled in a masterly manner...A book full of most useful information."—*Beck's Florist*.

"Given in so plain and understandable a manner that the merest tyro, by following the directions, may count on success."—*Florists' Journal*.

London: W. and T. PIPER, 23, Paternoster-row; and all Booksellers.

Second Edition, with 64 Engravings, price 2s. 6d., cloth, gilt edges.

GARDENING FOR CHILDREN.—Edited by the REV. C. A. JOHNS, author of "Forest Trees of Britain," &c. Price 6d.

GLENNY'S GARDENING FOR COTTAGERS, with a Calendar of Operations for Cottage Gardens, Treatment of Bees, Poultry, Pigs, &c. Price 1s.

GLENNY'S GARDEN ALMANAC AND FLORISTS' DIRECTORY for 1851.

A List of Treatises on Practical Gardening may be had on application.

London: C. COX, 12, King William-street, Strand.

SPLENDID WORKS ON NATURAL HISTORY.

EDWARDS'S BOTANICAL REGISTER, consisting of Coloured Figures of Plants and Shrubs cultivated in British Gardens, with their History, Treatment, &c. NEW SERIES, Edited by Dr. LINDLEY, with 750 *beautiful coloured plates*, 10 large vols. royal 8vo, new cloth, 5l. 15s. (pub. at 22l.). 1838-47.

This is the new and complete series of this beautiful and esteemed work. As the number for sale is very limited, early application is desirable.

MEYER'S BRITISH BIRDS and their EGGS, 322 *beautiful coloured plates*, with Descriptions. 7 vols. 8vo, in 108 Parts (just published at 18l. 18s.), only 8l. 8s. 1841-50.

This beautiful publication is the most complete illustrated History of British Birds. The figures are all drawn from nature.

CUVIER'S ANIMAL KINGDOM, arranged according to its Organisation, being a description of Quadrupeds, Birds, Fishes, Insects, Shells, &c. By CUVIER and LATREILLE. Translated from the last French edition, with 4000 figures, mostly coloured, on 800 plates, 8 vols. 8vo, half morocco, 3l. 10s. (pub. at 8l. 8s.). 1837.

This is the most scientific and general work upon the subject, and the only one upon Natural History suitable for a "Home Library."

WOOD'S BRITISH ENTOMOLOGY, or Illustrated Catalogue of the Lepidopterous Insects of Great Britain, containing 1944 *figures, beautifully engraved and coloured, of all the Butterflies and Moths*, with an Account of their Localities, &c. 8vo, cloth, 3l. 10s. (pub. at 8l. 8s.). 1845.

The most complete illustrated work on British Butterflies and Moths. The figures are executed with remarkable beauty and fidelity. Very few copies remain for sale.

G. WILLIS, GREAT PIAZZA, COVENT GARDEN.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their Office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, MARCH 22, 1851.

Remittances with orders are requested from unknown correspondents. Goods Carriage Free to London, and with all orders of 2*l.* and upwards, articles presented extra. Post-office orders payable to BASS and BROWN, or to STEPHEN BROWN.

GEORGE MILLS, 15 years Steward and Gardener to the late Baroness de Rothschild, at Gunnersbury-park, Ealing, Middlesex; 32 years F.H.S. of London; author of a Treatise on the Culture of the Cucumber, Melon, Seakale, and Asparagus; as also of a Treatise on the Culture of the Pine-apple; who has practised Horticulture, Agriculture, and Arboriculture 50 years, on the cold clay soils of Hants and Essex, as also on the light and warm soils of Bucks, Surrey, and Middlesex, begs most respectfully to offer his opinion on all subjects relating thereto, excepting Botany and Chemistry.

G. M. is induced to make the above offer from the advantage he derived in early life from the advice of a friend, his senior in practice. He has long been quite satisfied that the land under cultivation in this country, although great improvements have been made within the last 20 years by drainage, &c. &c., is still capable of greater improvement, and the hope of seeing those improvements carried out, induces him to offer his opinion thereon.

G. M. will give his opinion only where his experience will enable him to give it confidently.

Terms, 2*l.* per day, exclusive of travelling expenses; for less than a day, 1*l.*

GEORGE MILLS, Loraine Cottage, Hammersmith, Middlesex.

NATIONAL FLORICULTURAL SOCIETY.—OFFICES, 21, REGENT-STREET, LONDON.

The Printed Rules, &c., of the NATIONAL FLORICULTURAL SOCIETY will be forwarded to all *post paid* applications.

JOHN EDWARDS, Hon. Sec.

Mr. J. A. Henderson, Pine-Apple Nursery
Mr. Parker, St. John's Wood Terrace.

JOHN EDWARDS, Hon. Sec.

BLACK BARBAROSSA GRAPE.—Fine flavoured GRAPES may be obtained until April, by growing the above truly magnificent variety, introduced from the Continent by C. T. WARD, Esq. For further particulars, see *Gardeners' Chronicle*, March 8, 1851. Good Plants from Eyes may be obtained of JOHN BUTCHER, Nurseryman, Stratford-on-Avon, 10*s.* 6*d.* each. London Agent, Mr. F. WARNER, Seed Merchant, 28, Cornhill.

RYE-GRASS AND TURNIP SEEDS.

J. MORRISON AND SON are now prepared to execute orders for their RYE-GRASS and TURNIP SEEDS, and will be happy to forward by RAIL, free of charge, from ABERDEEN to any station on the lines southward, as may be agreed on, Samples and Seed. Catalogues on application. Seed Farm, Montcoffer; Seed Warehouse, Banff, N. B.

WARRANTED UNEQUALLED.

ROBERT WHIBLEY is now supplying Selections in Pots, and by Post, from his select Collection of FUCHSIAS. Twelve Varieties, new and distinct, of last year, 10*s.* 6*d.* cash. See List containing a great variety of choice new Plants for one stamp.—Nursery, Kennington, London.

GRASS SEEDS.

FINEST LAWN GRASS SEEDS, perfectly free from Weeds and coarse Grasses, 21*s.* per bushel, 3*s.* per gallon, or 1*s.* 3*d.* per pound, with instructions.

To insure a pure Turf of finest Dwarf Grasses, Messrs. SUTTON strongly recommend the sowing the above Seeds, whereby the great expense of cutting, carting, and laying Turves may be avoided.

PERMANENT PASTURE GRASSES,

*Mixed expressly to suit the soil for which they are required, at the reduced prices of* 22*s.* 6*d.* *to* 28*s. per acre, viz.*:

| | *£* | *s.* | *d.* |
|---|---|---|---|
| BEST MIXTURES for laying down Land to permanent Meadow or Upland Pasture, per acre ... | 1 | 8 | 0 |
| DITTO, for laying down Reclaimed Marshes and Common Inclosures, per acre ... ... ... ... ... | 1 | 2 | 6 |
| DITTO, for fine Park Lands near Mansions, per acre | 1 | 15 | 0 |
| DITTO, for Irrigation or Water Meadow, per acre ... | 1 | 6 | 0 |

SUTTON'S RENOVATING MIXTURE, consisting of Perennial Clovers and fine Grasses, for improving old Parks, Meadows, and Upland Pastures.

JOHN SUTTON and SONS *having reduced the price of these Seeds* 25 *per cent., viz., to* 10*d. per lb., or* 1*s.* 6*d. per gallon, great improvement in Pastures, &c., may be effected at a small cost, by the application of* 6 *or* 8 *lbs. per acre, sown immediately upon the old Turf.*

We are almost daily receiving unsolicited the most gratifying letters from our customers, in praise of our Seeds; and though we refrain from *publishing names* unnecessarily, we have much satisfaction in quoting the following:—

*From a Member of the Council of the Royal Agricultural Society.*

"Messrs. SUTTON,—I was particularly pleased with your Grass Seed, which I employed by itself, for laying down some fresh broken-up Land. It became a close fine sward by August. I have now about 30 acres of land to sow immediately, &c., &c., and shall be glad of your advice for the purpose."

*From the Land Steward at a large Estate in Hampshire.*

"All the kinds of Grasses sown separately grew admirably; and the 20 acres of Park laid down with *your Mixture* last spring is most excellent. We are anticipating a large crop of Hay, and I can see by the various habits and successional growths of the several kinds, that we shall always have a fresh growing bite for the cattle after the Hay is cut. The Clovers too I see are plentiful."

*From a Clergyman, an eminent Agriculturist and Member of the Royal Agricultural Society.*

"I have had the pleasure of praising your Seeds in many quarters beside that to which you refer. This I have done from a sense of justice only."

Another Clergyman writes us—"My Turnip crops are the admiration of all the farmers round, especially the Swedes and your Purple-topped Hybrid. I hope you have some of the same kind this year, as I am certain the superiority in my crops is mainly owing to the stocks."

*The above are similar to hundreds of others.*

N.B.—Instructions for Sowing accompany every Parcel of Grass Seeds; and any other information required by post will be promptly given.

*Goods delivered free of carriage to any Office in London, Bristol, Gloucester, Exeter, Southampton, &c.*

Reading, Berks, March 22.

ESTABLISHED 1786.

WILLIAM E. RENDLE AND CO., SEED MERCHANTS by special appointment to the SOUTH DEVON AGRICULTURAL ASSOCIATION, and several influential Members of the Royal Agricultural Society, Union Road, Plymouth.

We have this season a choice and well assorted Stock of all the best FARM SEEDS. They have been grown and selected with the greatest care, and can be highly recommended as being of the most genuine quality. Our sale of Turnip Seeds alone last season exceeded *one thousand bushels*; our extensive dealings therefore enable us to sell at the lowest remunerating prices, and at the same time is the strongest evidence we can offer of the large and increasing patronage bestowed upon us, for which we have to return our most grateful acknowledgments.

OUR DESCRIPTIVE CATALOGUE OF FARM SEEDS *is just published, and can be had in exchange for One Penny Stamp. It contains a description of all the best varieties of Turnips, Carrots, and Mangold Wurzel, with prices affixed to every article. The list of Grasses is peculiarly comprehensive, and contains short descriptions of all the leading kinds. There is also some useful advice relative to the sowing of Grass Seeds for permanent pasture, concerning which* Mr. KEMP, *of Birkenhead Park, in a letter to us says:—"I am glad that you repudiate the practice of sowing Corn with Grass Seeds, a custom I have often had to combat."*

All Orders above 2*l.* Carriage Free. (See Catalogue.)

Apply to WILLIAM E. RENDLE and Co., Seed Merchants, Plymouth.

GOLIAH STRAWBERRY.

JAMES KITLEY can supply good Plants of his celebrated Strawberry GOLIAH, at the very low price of 7*s.* 6*d* per 100, or 12 Plants, free by post, for 18 postage stamps. Also fine Plants of Dwarf German HOLLYHOCKS mixed, at 12*s.* per dozen; these have all bloomed, and are very double and beautiful. HOLLYHOCK SEED, saved from a fine collection of double varieties, 18 packets, named, free by post, for 5*s.*; ditto mixed, per packet, 2*s* 6*d*. SWEET WILLIAM SEED, from a great variety of beautiful brilliant colours, per packet, 1*s.*

Lyncombe Vale Nursery, Bath. March 29.

VALUABLE VEGETABLES.—CAULIFLOWERS.—Myatt's improved early, much earlier than the old varieties, more compact and heavier, considered by the raiser as most desirable, quantity very limited, 1*s.* packet.

BRUSSELS SPROUTS, improved variety, direct from Brussels; 1*s.* per oz., 6*d.* per packet.

CABBAGE, MITCHELL'S ENFIELD.—This has been tried at the Horticultural Society's Garden, and pronounced one of the best; 1*s.* per oz., 6*d.* per packet.

CABBAGE, CHAPPEL'S COLEWORT, excellent for Winter Greens; 6*d.* per oz.

CARROT, ST. JAMES', one of the best for small gardens, and shallow or heavy soils; 3*d.* per oz.

CELERY, COLES' SUPERB RED, very extensively grown last season, and pronounced first-rate; 1*s.* per oz., 6*d.* per packet.

LETTUCE, VICTORIA CABBAGE, but little known, but one of the handsomest grown, and which no gentleman's garden should be without.

DUNCAN HAIRS, in offering the above selection from his general List, begs to inform his friends that he warrants them to be as described.

109, St. Martin's-lane, Charing-cross, London.

PLANTS! PLANTS! PLANTS! NEW AND CHEAP.

H. WALTON begs to offer the following at the very low prices named. DAHLIAS of 1850, 9*s.* and 12*s.* per dozen; older varieties, 4*s.* 6*d* to 6*s.* per dozen. FUCHSIAS, new varieties, 20 for 18*s.*, 12 for 12*s.*, 6 for 7*s.*; older varieties, 5*s.* per dozen. VERBENAS of 1850, 1*s.* each, or 6*s.* per dozen; older varieties, 3*s.* to 4*s.* 6*d.* per dozen. PETUNIAS of 1850, 9*s.* to 12*s.* per dozen; older varieties, 6*s.* per dozen. 12 of the choicest PANSIES of 1850, 16*s.*, or 24 for 1*l.*; older varieties, 6*s.* to 9*s.* per dozen. CINERARIAS, sent out last spring, 9*s.* to 12*s.* per dozen. GERANIUMS, 7*s.* 6*d.* to 12*s.* per dozen. 12 first-rate Show CARNATIONS, 9*s.* to 12*s.*; 12 first-rate Show PICOTEES, 9*s.* to 12*s.*; 12 first-rate Show PINKS, 4*s.* to 6*s.* Named CHRYSANTHEMUMS, 6*s.* per dozen.

For particulars of the above see Catalogues, which may be had by enclosing one stamp. Strong, healthy, well rooted plants, may be depended on; securely packed, so as to ensure the safe delivery of all orders at the least possible expense.

It is respectfully requested that all orders be accompanied with a post-office order, made payable at Marsden, in Lancashire.

HENRY WALTON, Florist, Edge End, Marsden, near Burnley, Lancashire.

MESSRS. HAY, SANGSTER, AND CO. will be ready to supply their prepared POTATO CUTTINGS about the middle of April next, the produce of which proved so highly satisfactory last, as well as the experimental trials of the three former years, as to QUALITY, QUANTITY, and SIZE, being more than double the crop this year of those planted in the usual way, and containing a much larger quantity of starch, which is so essentially necessary to the preservation of that valuable root. A report of the analysis will be found below. Our own experiments give about one-third more saccharine matter than the best we could procure grown under the old system. All orders must be to hand on or before the end of the second week in April, as H. S. and Co. are preparing to plant a large breadth, and will only provide for what may be ordered up to that time. Post-office orders to be made payable to JOHN SANGSTER, at the Borough Post-office, Southwark. Printed instructions for planting and management will be sent with the plants ordered.

STANWICK NECTARINE—SALE OF, IN AID OF THE FUNDS OF THE GARDENERS' BENEVOLENT SOCIETY.

Circumstances have rendered it necessary to modify the intentions expressed at p. 676 of the *Gardeners' Chronicle*, respecting the STANWICK NECTARINE. Upon examining the young plants in Mr. RIVERS's hands, it turns out that the number fit for sale is much smaller than was anticipated, and that there is a considerable difference in their quality. Applicants are moreover anxious to obtain their plants without loss of time, and without waiting for the chance of an auction which cannot take place, to the advantage of the charity, sooner than next spring. It has therefore been resolved to set aside the finest plants for sale at from 4 to 5 guineas each, and to dispose of others at 3 guineas each. Such as are unsold in the spring, if there should be any left, will be brought to the hammer as at first proposed.

Of the selected specimens, some are beautiful plants in pots, budded on the Peach stock, and covered with blossom-buds, so that they will fruit next year if repotted; for these five guineas will be charged. The remainder are very fine maiden plants in the open quarter, budded on Plum stocks, and without blossom-buds; for these 4 guineas are required. Gentlemen desirous of aiding the excellent charity to whose funds the produce of the sale of these plants will be applied, by order of his Grace the Duke of Northumberland, are requested to apply to Mr. WILLIAM BRAILSFORD, 21, Regent-street, London, giving their exact addresses, and stating by what conveyance the plants are to be transmitted from the station at Harlow, on the Cambridge line of the Eastern Counties Railway, where they will be delivered without further charge. It is requested that Post-office orders may be made payable to Mr. WILLIAM BRAILSFORD, who, upon their receipt, will return an order upon Mr. RIVERS for the transmission of the plants.

Applications will be complied with in the *exact order* in which they are received, and due notice will be given when the five guinea and four guinea plants are exhausted.

May we be permitted to express a hope, that although no pecuniary profit can be derived by nurserymen from a sale whose proceeds go to a charitable use, yet that they will, nevertheless, endeavour to make known, within the circle of their customers, the terms on which the Stanwick Nectarine may now be procured.

PRICED CATALOGUES OF

LOUIS VAN HOUTTE, NURSERYMAN, Ghent, (*Belgium*), to be had of Mr. GEO. RAHN, 52, Mark-lane, London.

Nos. 40 and 41.—BULBOUS PLANTS. HARDY PERENNIALS, GREENHOUSE AND STOVE PLANTS. (*October*, 1850.)

No. 42.—ORNAMENTAL AND CULINARY SEEDS. (*January*, 1851.)

No. 43.—ROSES. (*February*, 1851.)

No. 44.—CAMELLIAS. (*March*, 1851.)

*** The usual discount to the trade.

CAMELLIA STOCKS FIT FOR IMMEDIATE WORK.

RENE LANGELIER, Clarendon Nursery, St. Helier, Jersey, begs to inform the Public that he has a very extensive stock of the above, fit for immediate grafting, very clean and healthy, well rooted, so as to leave without the pot, consequently much less expense in conveying to any distant place. Price 36*s.*, 40*s.*, and 50*s.* per 100.

The Stock is such as has never before been offered to the Public by any grower.

R. L. has a most extensive collection of Double Camellias at a very moderate rate and reduced price, as will be seen by a Catalogue recently published, in which it is proved that they can stand the climate out-of-doors without protection. The Catalogue can be had of R. L. by inclosing four penny stamps. Remittance or reference from unknown correspondents

THE BLACK AUSTRIAN PINE (PINUS AUSTRIACA).

LUCOMBE, PINCE, AND CO., have a large and healthy stock of this most desirable Pine, from 9 inches to 3 feet high, which having been frequently transplanted, are well-rooted and safe to remove: they can offer them, varying according to age and quality, from 20*s.*, 40*s.*, to 60*s.* per 1000. This Pine has been proved to thrive in bleak and exposed places, and in the poorest soils, growing rapidly, and producing dense shelter in places where other trees will not grow; it also thrives well close to the sea, resisting the spray and roughest winds. N.B. The present is a very fine time for planting.

Exeter Nursery, March, 29.

VERBENAS.—A Set of Twelve of the most extraordinary Seedling Verbenas ever offered. As a proof of their excellence, they have been awarded 30 first-class certificates; three of them will be figured in the "Gardener's Magazine of Botany," April 1. G. S. begs to say that they are very distinct, and far surpass any previously raised. The set in strong plants, the third week in April, at 2*l.*, or 5*s.* per plant. For descriptions, see Catalogue, which will be forwarded on the receipt of one postage stamp, with the description of the beautiful Fuchsia Sedonia, figured in the "Gardener's Magazine of Botany," for March. Also his new Petunias and Heliotropes. Selections, with prices of Verbenas, Fuchsias, Dahlias, Chrysanthemums, Geraniums, &c., at moderate prices.—GEORGE SMITH, Tollington Nursery, Hornsey-road, Islington, London.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, March 29.

AZALEA INDICA "SYMMETRY" (KINGHORN.)—The celebrity this Flower has gained, and the eulogium that has been bestowed upon it, render it only necessary to mention the opinions of competent judges, the awards it has received, and simply to add that it is superior in shape and substance to any variety hitherto introduced, and equal in colour and habit to the most popular kinds. In May, 1850, a first class certificate was awarded to it by the London Floricultural Society, and it was thus described in the *Gardeners' and Farmers' Journal*. "Azalea indica Symmetry is a magnificently formed flower, of extraordinary substance; colour salmonish-pink, varying to light scarlet, richly spotted in the throat with deep crimson; size large." At the June show, 1850, at Chiswick, it obtained the Silver Banksian Medal, and was recorded in the *Gardeners' Chronicle* as "a considerable improvement on Lateritia." JOHN and CHARLES LEE having purchased the stock of Symmetry, intend sending out healthy Plants on the 1st of June, price 21*s* each.—Nursery and Seed Establishment, Hammersmith, near London.—March 29th.

T. JACKSON and SON have still on hand a limited quantity of their Improved KIDNEY POTATO, at 7*s.* 6*d.* per bushel, and Golden Dwarfs at 5*s.* 6*d.* (an excellent Early Frame Potato); for the particulars of their merits, see *Gardeners' Chronicle* of the 14th or 21st December.

T. J. and SON, having the largest stock in the country of Taxodium sempervirens, are enabled to offer them at the following low rates:—Fine plants, 2 feet high, 2*s.* 6*d.*; 6 feet, 21*s.*; intermediate sizes at proportionately low prices. Forsythia viridissima, 3 feet high, full of flower-buds, 2*s.* 6*d.*; and all other general Nursery Stock at equally low prices.

Nursery, Kingston, Surrey, March 29.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening pursuits, are invited to examine G. and J. DEANE'S extensive Stock of GARDENING AND PRUNING IMPLEMENTS, best London made Garden Engines and Syringes, Coalbrookdale Garden Seats and Chairs.

G. and J. DEANE are sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with the Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom.—DEANE'S Horticultural Tool Warehouse, opening to the Monument, 46, King William-street, London-bridge.

TO FLORISTS.

PRINCE OF WALES' BAZAAR, REGENT-STREET.—The CONSERVATORY in this elegant and unique Building TO BE LET, on the usual terms. Apply to the Manager, at the office, 207 and 209, Regent-street, between the hours of 10 and 5 o'clock daily, where a printed form of the rules and regulations can be obtained. All letters must be pre-paid.

UNIVERSITY COLLEGE, LONDON.

ELEMENTARY COURSE OF BOTANY.

PROFESSOR LINDLEY will commence a course of Lectures on Botany, to a Junior Class, on Monday, April 7, at 8 o'clock, A.M. *Subject*.—The Distinctions between the principal Natural Classes and Orders of Plants belonging to the Flora of Europe. The Lectures will be delivered, with the exception of the Easter Vacation, daily, at 8 A.M., until May 1; afterwards on Tuesdays, Wednesdays, Thursdays, and Saturdays, from 10¼ to 11¼. The course is adapted to persons commencing the study of Botany. Fee 2*l.* The course to the Senior Class will commence on the 1st of May.

THOMAS GRAHAM, Dean of the Faculty of Medicine.

HENRY MALDEN, A.M., Dean of the Faculty of Arts and Laws.

CHARLES C. ATKINSON, Secretary to the Council.

March 29.

HALL'S GARDEN NETS, of superior lightness and strength.—These Nets are found to be a good protection against Frost, Hail, and Wind; also from Wasps and Insects. They are of great width, and very durable. Also valuable as outside shades to Greenhouses, &c.

Nos. 1 and 2, 56 inches wide ... ... 6*d.* per yard.
No. 3, 56 inches wide, close shelter ... 8*d.* ,,
No. 4, ,, ,, thread leno ... 8*d.* ,,

P.S.—It will be observed that No. 1 Net, of which there is the largest consumption, is only 4*d.* the square yard, or rather less. All the Nets are 56 inches wide, and so made that two breadths can easily be joined.

AGENTS FOR SALE.—LONDON.

NETTING, FLAGS, AND BUNTING.—Tanned Garden Netting, for protecting Fruit Trees from Frost, Blight or Birds; or as a Fence for Fowls, Pigeons, Tulip and Seed-beds, can be had in any quantity from JOHN KING FARLOW'S Fishing-rod and Net Manufactory, 5, Crooked-lane, London-bridge, at 1½*d.*, 1 yard wide, 3*d.* 2 yards, or 6*d.*, 4 yards wide. Woollen Bunting, any length or width, at 6*d.* per square yard. Forwarded to any part of the kingdom on receipt of remittance, Post-office order, or stamps. Several good second-hand Flags to be sold cheap.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

F. M'NEILL AND CO., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING

Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

PELARGONIUMS AND NEW PLANTS.

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST to HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to inform the Nobility, Gentry, and Amateurs, that his Spring CATALOGUE of PELARGONIUMS and NEW PLANTS is ready, and will be forwarded by post on application.

BEAUTIFUL FLOWERS.—FLOWER SEEDS, hardy, half-hardy, and perennials, forwarded free by post, at the following low prices, all warranted :—100 packets, 5s. ; 70, 4s. ; 50, 3s. ; 30, 2s. 6d. ; or 12 for 1s. ; tender annuals at 2s. 6d. per dozen packets ; garden seeds in packages, at 5s., 10s., and 20s. each, containing nearly double the usual quantities, sent out, and all of the best kinds in cultivation. A few packets of extra fine Balsam seeds at 1s. ; Cucumber and Melon seed, 6d. a packet. List, with sample packet, for two stamps. Address JOSEPH GOLDING, Seedsman, Hastings.

THE FLOWER OF THE DAY—VARIEGATED SCARLET GERANIUM.—This elegant plant is of vigorous habit, the foliage bright green, with a broad silver margin. The flowers light scarlet, in large trusses, like Globe Compactum. JOHN and CHARLES LEE are selling extra strong plants, at 10s. 6d. each. Small plants for bedding on the 1st of June, 6s. per dozen.—Nursery and Seed Establishment, Hammersmith, near London.

SEEDS FOR THE FARM, THE KITCHEN-GARDEN, AND THE FLOWER-GARDEN.

JAMES SALTER having tested the Growing Qualities of the Seeds he is now sending out, can with confidence warrant them to be as good, and as low in price, as at any respectable Seed Establishment in the Kingdom. All the most approved varieties of CUCUMBER and MELON, 1s. per packet. Flower Seeds forwarded (free) by post. Descriptive Lists, with instructions for sowing, sent on application.

N. B.—Just imported, a fine collection of CONTINENTAL FLOWER SEEDS ; also, fine double ITALIAN TUBEROSES.

SEED ESTABLISHMENT, 2, New Bond-street, Bath.

CHOICE VEGETABLE AND FLOWER SEEDS.

JOHN CATTELL, NURSERYMAN and SEEDSMAN, Westerham, Kent, begs to offer to the Public a few very superior SEEDS, selected from his collection, which may be had at the annexed prices, free by post.

PANSIES, 25 varieties, extra fine show flowers, named ... ... ... ... 0 12 0
This being the best time for planting out the above beautiful flowers, JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester, begs to inform Gentlemen, Florists, &c., &c., that having a large Stock, he offers them at the above *low* prices, hamper included.—Post-office orders to be made payable at Middleton, near Manchester. Auriculas, Alpines, Polyanthuses, &c. Catalogues on application.

R. M. STARK begs to intimate that his Spring Catalogue of FLORISTS' FLOWERS, BEDDING, GREENHOUSE and other plants, containing many interesting novelties, is now ready, and may be had on application. Garden, Farm, and Flower Seeds of fine quality, and from the most approved Stocks.
Edgehill Nursery, Edinburgh, March 29.

NEW DAHLIAS; E. FOSTER'S, Esq., CHOICE PELARGONIUMS; PICOTEES, CARNATIONS, HOLLYHOCKS, PANSIES, &c.

WILLIAM BRAGG, Star Nursery, Slough, begs to say his Catalogue of the above Flowers is now ready, and can be had on application. His choice SEEDLING DAHLIAS will be sent out the first week in May at 10s. 6d. each, viz. :—

ADMIRAL, rich lilac, very constant, gained first Seedling prize, 25s., at the Royal South London Exhibition ; 21s. Shacklewell Open Shows, &c , fourteen first class certificates ; the most successful flower of the year.

CARMINA, rich carmine, constant show flower, gained six first class certificates, &c., shown in several winning stands.

The Hon. Mrs. ASHLEY, waxy white, tipped with rose, splendid show flower, &c. W. B. thinks it the best Dahlia of the season ; was awarded by Dr. LINDLEY a certificate of merit at the Horticultural Society, &c. Gained five first class certificates.

QUEEN OF FAIRIES, Domever. W. BRAGG has purchased the stock of this fine and constant fancy Dahlia, from the above amateur, who will give 5l. in prizes the next season for this flower. It gained a Seedling prize and first class certificate, with Edwards's Mrs. HANSARD ; at the Royal South London Open Show Exhibition five first class certificates.

W. B.'s stock of Picotees, Carnations, and Pinks are strong and good ; the best Hollyhock Seed ever sent out can be had in 2s. 6d. and 5s. packets, post paid, for prepayment.

HOLLYHOCK SEED.

EDWARD TILEY begs to inform the lovers of that beautiful flower that he has been successful in procuring a quantity of good sound SEED of the above from an Amateur Gentleman who has one of the most superb and choice collections in cultivation ; the seed having been selected with every care and attention, he can confidently recommend it. Sold at 2s. 6d. per packet, containing 150 seeds, or 5s. for a packet of 400 seeds.

GERMAN ASTER SEED.

Unequalled for the superiority of flower, the shape of which forms that of half a globe, and has been admired by thousands of spectators at numberless exhibitions. There are from 20 to 30 varieties, 1s. per packet.

SWEET-WILLIAM SEED.

Saved from 24 superb varieties. The flowers are very large, and of dwarf habit. They were much admired when in bloom, by countless spectators, and the Seed numerously ordered by them ; 1s. per packet.

ANTIRRHINUM SEED.

E. T. being a most extensive grower of all the choicest sorts known in cultivation, has selected the Seed with great care from the finest varieties, as to colour, shape and habit of plant. There are more than 50 distinct varieties ; 1s. per packet.

DWARF ORANGE AFRICAN MARIGOLD SEED.

Unrivalled for its superior size and darkness of colour, many of the flowers last season measuring 5 inches over, and not more than 1 foot high ; 6d per packet.

Or, if preferred, a 5s. packet of Hollyhock and a packet of each of the above varieties for 7s.

Walcheren Cauliflower Broccoli (as imported) 1s. 0d. p. packet.
Tamworth Broccoli ... ... ... ... 1 0 ,,
Wilcove Broccoli ... ... ... ... 1 0 ,,
Cole's Superb Solid Celery ... ... ... 0 6 ,,
Bath Cos Lettuce, seed true, the best and finest flavoured in cultivation ... ... ... 1 0 ,,

A remittance must accompany the order, either in cash or penny postage stamps for the amount.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath.

WE are happy to announce that by the last Indian Mail, Dr. HOOKER, and his friend, Dr. THOMSON, arrived safely from Chittagong. We have had frequent occasion to speak of the important and dangerous travels of the former of these gentlemen, from which the most valuable contributions to physical geography and natural science are to be expected. We understand that Dr. HOOKER's collections, which are on their way home by the Cape of Good Hope, are equally remarkable for their interest and great extent.

THE power of absorbing and retaining ammonia, which most experiments have shown the soil to possess, probably will explain the reasons why in certain cases, on particular soils, and applied to particular plants, the salts of ammonia sometimes appear to produce little benefit. Several observers have at different times stated, that to their great surprise, they had found many of the salts of ammonia, not only without any beneficial influence on vegetation, but even absolutely hurtful to plants. It was this which some years since led BOUSSINGAULT to the conclusion, that salts of ammonia were only useful to plants when the ammonia was either combined with carbonic acid or some easily destructible organic acid. Plants fed with water alone, or planted in pure siliceous sand, and watered with solutions of various salts of ammonia, in place of being benefited, were killed ; although the same plants, when grown in common soil, and watered with the same ammoniacal solutions, were certainly rendered more healthy and vigorous. The conclusion to which BOUSSINGAULT was at last led, was, that the only salt of ammonia really useful to plants was the carbonate, and, therefore, that in all cases where the other salts of this alkali were used as manure, the acid must, by some process of chemical decomposition, be removed, and replaced by the carbonic. A key to some of the difficulties which these observers could not explain is now given to us, in the fact that an ordinary fertile soil possesses the power of decomposing the salts of ammonia, and by the acid of lime displacing the acid with which the ammonia is combined. It has often been stated by careful observers that they could find no difference in the relative value of the various salts of ammonia as manure, and that they all acted perfectly alike on plants ; this is not what might reasonably be expected, but it would, of course, follow as a necessary consequence from the power of the soil which has lately been brought to light.

There is, however, still another question which must be satisfactorily explained, before we can have any very accurate idea of the precise mode in which these changes are effected ; and that is, the subsequent process whereby the ammonia which the soil has absorbed is given off again, and taken up by plants. All that is now shown is, that the soil is able to fix a considerable quantity of ammonia, which is retained by it with a good deal of force, so that mere subsequent washing will not remove it. By whatever means it is that the soil is able to do this, it is tolerably certain that there exists some means whereby plants are able to avail themselves of the ammonia thus arrested, and stored up by the soil. Whether these means are simply chemical ; whether they depend in any way on the influence of light, or whether they are to be traced to the vital powers of the plant and the peculiar structure of the roots, is not yet ascertained ; but two things are plain ; firstly, that the soil takes up from rain-water all the ammonia which the latter contains ; and, secondly, that the soil again parts with some of this ammonia to plants growing in it.

The power of any soil thus to absorb ammonia is unquestionably limited ; and if we continue to filter a weak solution of ammonia through a portion of any soil, though the water which comes through at first will not contain any ammonia, yet after a short time, and when the soil has taken up as much as it is able to absorb, then the water which passes through will be found to contain as much ammonia as it did before it was thus filtered. The quantity which the soil is able to retain is not great, but it is abundantly sufficient for the wants of plants. Until we know the mode in which clay subsequently parts with the ammonia which it has absorbed, we shall not be able to devise the best means of preventing the loss of that substance, or of making the most of the power in question. There is, however, every probability that by continued exposure to the air alone, much of the ammonia which has been absorbed during a summer shower, for example, is again slowly given off ; an effect which the mere gradual evaporation of the surface water would greatly tend to accelerate. Hence it is not to be expected that any soil, however constituted, could, by mere exposure to the air, ever become very rich in ammonia, or indeed contain more than a minute trace of it ; because the entire quantity which it could possibly receive in any one day could only be very minute ; and though it is true that the constant repetition of such additions to the soil would in time amount to a considerable quantity ; yet, as it would take a long time, and as, during the whole of this time, the soil would be necessarily exposed to the influence of evaporation, and the other causes, whatever they may be, which tend to remove ammonia again from the soil ; so it is not to be expected that, even under the most favourable circumstances, any large accumulation could take place.

It will be an important subject of inquiry, to ascertain how much ammonia a good clay soil is able to absorb under the most favourable circumstances ; for if the quantity is sufficiently large, it would unquestionably be worth while to form large filter beds in the reservoir of drainage water from towns ; not as has often been proposed, merely for the purpose of purifying it from all the solid matters mechanically suspended in it, but also to arrest the ammonia and other valuable soluble elements of manure which it contains. Some of Mr. WAY's experiments on this subject are very curious. He not only found that by filtering a portion of putrid drainage water through a few inches of soil, it had lost all bad odour, and contained no longer any ammonia ; but he also found that on filtering fresh liquids of this sort, which had not yet begun to putrefy, through such a layer of soil, they even lost

all tendency to putrefy, and might then be kept weeks exposed to the air without their showing any indication of putrefaction. Although the chief agent in producing these remarkable effects is clay, yet it is evident that such filtering beds, if worth making at all, could not be made of clay alone, because, from its close tenacious nature, and the extreme slowness with which it allows the percolation of water, it would be evidently unfit for any kind of filter; and a mixture of clay and sand, such as we find in a good moderately stiff soil, would no doubt be far better. Mr. WAY's experiments prove that the soil has a power of absorbing potash, soda, magnesia, and phosphoric acid, as well as ammonia; and if we add to these one more substance, namely, lime, we have most of the chief elements of manure.

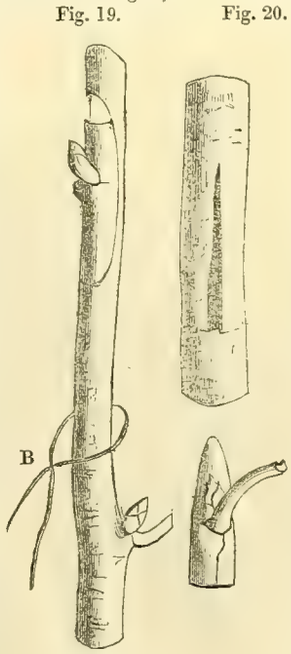
As we said a fortnight since, when adverting to these very curious and important experiments, the subject is not yet half investigated, and there appears to be many chemical points not satisfactorily explained; some of these, as we then suggested, probably depend on mechanical rather than on chemical causes. Pure white clay, which had been boiled for two hours in strong muriatic acid, and which therefore evidently did not contain any free carbonate of lime, was nevertheless found to decompose a solution of muriate of ammonia which was filtered through it; a portion of the ammonia was absorbed, while the acid passed through in combination with lime; though, as may be supposed, far less ammonia was absorbed than when a clay containing free carbonate of lime was used as the filter. From this result we learn that such clay, which always contains a small quantity of lime, though it does not give up that lime to the action of a strong chemical solvent (such as boiling muriatic acid), nevertheless, does part with it readily under the influence of the much weaker solvent powers of a solution of muriate of ammonia. Another, and an equally surprising result, was obtained on endeavouring to ascertain whether a given soil would absorb the same relative proportion of ammonia from solutions containing different salts of that substance. An equal weight of soil was employed in each case, and it was found that when a weak solution of pure caustic ammonia was used, and there was therefore no chemical affinity to be neutralised or overcome, every thousand grains of the soil took up about a grain and a half of ammonia; on the other hand, when a solution of muriate of ammonia was used, in which case the salt had to be decomposed by lime under the influence of the soil, then nearly one-third more, or two grains of ammonia, was absorbed by every thousand grains of the soil.

We have mentioned the influence of mere mechanical conditions in modifying, or even for the time setting aside, the ordinary laws of chemical action; and we quoted, as an illustration, the action of sulphate of ammonia on chalk. Another and a very curious example of the same sort of effect is shown in the mutual action of common salt and chalk. It is a well-known fact that a solution of common salt has no chemical action on chalk; indeed, when solutions of muriate of lime and carbonate of soda are mixed together, the salts are both decomposed, a mixture of common salt and chalk is the result, and, however long these two substances are left together, no further change takes place. If, however, a quantity of sand is added, and the mixture exposed to the air, but protected from rain, it will be found in a short time that the two substances react on each other, and give rise to the reproduction of those very substances, by the mutual action of which they have themselves been formed. A dry mixture of salt and chalk remains wholly unchanged, and so also does one which is thoroughly wetted; but if it is divided by the addition of soil or sand, and kept moist, both substances are partially decomposed, and the decomposition which then takes place is directly opposed to the ordinary known laws of chemical combination. It is plain, then, that the action of salt on any soil must, in great part, depend upon the mechanical condition of the latter; and whether the circumstances are such as to favour the decomposition of the salt, and the consequent formation of carbonate of soda. A little more or less rain may make all the difference, by preventing or assisting in the decomposition of the salt. This fact, which has been known some time, derives additional interest from Mr. WAY's experiments.

## GRAFTING.

No. XIII. BUDDING WITH DORMANT EYES. (*Greffe en écusson à œil dormant.*)—Some time previous to performing this operation, we ought to select the place on each stock which the bud should occupy, and remove all shoots likely to deprive the latter of the free contact of air. If this proceeding has been so far neglected as to be put in execution only a few days before budding, it is likely to occasion an interruption of the sap, and consequent adherence of the bark to the alburnum. If there has been such negligence, then the removal of the shoots should only take place at the moment when the bud is to be inserted; and even with this precaution, there is a chance of bad success.

It has long been known that this mode of budding has immense advantages over all others, seeing that, if the buds do not succeed, the stocks are but little deteriorated by the proceeding; there is frequently an opportunity of making a second operation 10 or 12 days after the first; and, as a last resource, these stocks may be budded in the following season by the same mode, or by any other which their size may determine.



The various kinds of plants which may be budded, by dormant eyes, differ very much as regards the period of the flow of sap, and the length of time it continues; it is therefore of great importance to watch attentively the growth of each species, in order to seize the most favourable moment for budding with chance of success. I confess that that this requires some practice. Our experienced budders judge that it is time to perform the operation when three-fourths at least of the shoots of each stock have ceased to push; in this state the bark of every tree is mature, and yet can be easily detached from the woody substance which it covers, and the sap being more stationary, we no longer dread its impetuous superabundance, which always proves detrimental to the success of the buds, frequently causing many of them to perish from plethora; in this case we say the sap has drowned them. If, however, circumstances render it necessary to bud before this excessive flow of sap is over, which will be indicated by the great number of shoots still forming, it will be necessary to cut back all their herbaceous tops as soon as the bud is inserted.

All that relates to the operation of this mode of budding is referable to that which has been stated concerning the preceding. With regard to the ligature, it is best to remove it at the fall of the leaf, in order to avoid the stagnant moisture which it retains about the bud, and which is prejudicial to the latter during winter. The heads of the stocks thus budded should be cut back in the following spring; for we must not be in too great haste to perform this operation, more especially on some delicate species having gummy sap.

Where propagation is carried on in a small but careful way, they cut back the stock to within ¼ of an inch above the bud. The principles of this operation ought to be based on those detailed in treating of pruning near a terminal bud [sloping behind the bud, more or less, according to the thickness of the stock]. In extensive operations, the cutting back is done roughly at 3 or 4 inches above the bud, in order that the stump may serve as a support to the shoot produced by the bud, which is temporarily fastened to it; and then the stump is not cut back till May or later, when many of the shoots require taller supports.

BUDDING WITH THE SHIELD REMOVED WITHOUT ALBURNUM: fig. 19. (*Greffe en écusson dénuée de bois.*)—This mode, somewhat more complicated than the preceding, is employed for propagating delicate trees and shrubs with slender wood, and thin, tender bark. The shield is usually raised as follows: we trace its form with the blade of the grafting knife, cutting completely through the bark, and having removed a portion of that adjoining, fig. 19, we then press the shield between the fingers, and wrench it, in order to detach it from its position, accompanied with the small fleshy body under the eye; for, if by mischance it be found bruised, or if it remain attached to the alburnum, the shield must be destroyed, and another substituted. The frequent occurrence of this inconvenience has given rise to an infallible means of avoiding it.

Fig. 19. Fig. 20.

It consists in employing a fine wire, as indicated at B, and maintaining it in that position, whilst pulling the two ends; it is made to glide along the alburnum, easily detaching the shield with the eye adhering to it. The bud is placed in the same way as directed for those in the preceding modes.

BUDDING WITH THE SHIELD PLACED IN AN OPENING MADE IN THE FORM OF A T REVERSED (⊥); fig. 20. (*Greffe en écusson placée dans une plaie faité en forme de T renverse,* ⊥)

*Operation.*—Cut a shield of which the point shall be above the eye; see A. Raise this shield by means of a wire, as above explained; make in the stock an opening by the cuts indicated in the figure, and there insert the shield by introducing its point at the base of the opening; unite the parts, and secure the whole by a ligature, which should commence below the eye.

This mode of budding is preferable to all others for propagating the good species and varieties of Oranges and Olives, and all other tender trees with gummy sap. *Translated from the French of D'Albret.*

## BRITISH SONG BIRDS.

(CAGE BIRDS, No. 7.)

No. XXIII.—Never put up a pair of turned-crown, or tufted birds, to breed from. The offspring of such a pair would most probably be born bald; or, at all events, partially so; besides being in other respects deformed.

Also, be careful *never* to buy your birds of men and boys in the streets. I will tell you why. These individuals—a large number—are, one and all, in the pay of the London bird-dealers, who sell them, for a *bagatelle*, their refuse stock. They never, by any chance, are possessed of a bird of the slightest value; the whole lot consisting of old hens, and other unsaleable fry. A song bird they know nothing about; they never had in their possession such a rarity. If my readers be wise, they will treasure up this knowledge. I vouch for the truth of my remark.

Another caution I must here put forth. The London bird-dealers are aware, that the public have a morbid fancy for what are *called* "German canaries." These latter, be it known, are imported in very small wicker cribs, allowing the birds scarce space sufficient to turn round. They are then permitted to see each other in every possible direction. The excitement produced thereby, naturally makes them, *for a season*, stout in song. The German canaries—the *real* ones I mean—being expensive, loads of these "German" wicker cribs, like loads of our "fine crusted Old Port," are manufactured here—in London. Norwich and Yorkshire canaries are then put into them; and when *labelled* "German canaries in full song, just imported," John Bull, "hearing them sing," swallows the bait; buys them; and innocently believes them—German! There are, be it observed, *very* few London dealers in first-rate German canaries; and to deal with *these*, you had need "rise early!" '*Cavendo tutus*' must be your watchword, the moment you enter their doors.

All birds of a uniform colour, when paired together, produce their exact counterpart. In order, however, to secure an infinite variety of colours, to which, in the canary, there can be no objection—if a male grey is united to a mealy hen, or *vice versâ*, the issue will be more handsomely marked than their parents. By carrying out this principle, which I cordially recommend to all who can give their time to it, results may be produced of a truly interesting character. Birds of every shade, and every tint, may be reared; in fact, such combinations are inexhaustible.

The *lizard* canary is a beautifully-marked bird, and forms a striking variety amongst others. It resembles the fancy birds; inasmuch as it has a clean yellow cap, with the back and breast richly spangled with black and green. It is called "lizard," from its closely resembling the colour, and having the marks of that reptile. They may be reared from a pair of very strong fancy birds, put up in a breeding cage.

We will now proceed to the subject of "breeding" canaries; and speak, first, of those bred in a *room*; the treatment of these, and those bred in a *cage*, will be found somewhat different.

As it would hardly be worth while to rear canaries a pair or two at a time, it will be desirable to select a good sized room, as nearly square as possible. In fitting it up, many hints may be taken from my earlier directions for the arrangement of an aviary.

It is indispensable that the aspect be suitable, and that the morning sun be freely admitted through the windows. This is a comfort, which canaries, in particular, highly prize. It keeps them lively, cheerful, and in good health. The windows should be made to open; so as to admit the air, and keep the apartment sweet. To prevent the birds escaping, galvanised wire-work, closely meshed, should be fastened over each window. Let the floor be kept thoroughly clean, and nicely gravelled. This is at all times desirable; but, in a breeding-room, it is more particularly so—for many obvious reasons.

In arranging your nest-boxes, which should be of mahogany, place them—some moderately low, and others in a more elevated position. Many birds are shy, and cautious, when building, and like to be free from observation. Those which are more familiar, prefer making their nest nearer the centre of the wall.

The materials for building are sold, by the dealers, in nest-bags; but they are not fit for use until they have been thoroughly scalded in clean, boiling water. Previously to their being submitted to this operation, they should be well shaken, to rid them of dry dust and dirt. The main object of the boiling water is, to destroy the hosts of vermin which inhabit these nest-bags, as if by a prescriptive right.* No other process will annihilate them. As birds, like the human race, are subject to occasional vagaries, whims, and fancies, let the number of your nest-boxes be just double the number of your birds; and place them in all corners of the room, so as to afford a "choice." Some, like a dark situation; others, one opposite to the light.

* My fair, but anonymous correspondent, on whose letter is impressed the post-mark of "Overton, Hants," will do well in forwarding me her name and address. I will then gladly respond to her enquiries, one by one, and propose an immediate remedy for her grievance. I understand the case thoroughly; and I sympathise with her most sincerely. These insatiate *Thugs* must be exterminated, and without an instant's delay.

Instead of giving your birds "hoppers," or seed boxes, on the wall, use those which in form resemble an inverted Lucca-oil bottle. The mouth is turned downwards, the shoulder resting on a green earthenware cylindrical stand, about 4 inches deep, with holes in the sides to admit the birds' heads. This arrangement confines the seed in a small compass; and as it is consumed, more descends to supply its place. Birds, when breeding, are dainty, and are apt to waste a great deal of their food. This is a kind of check upon such wanton extravagance.

The apartment should contain at least two windows, so as to admit plenty of light and air—those essentials to health. A tree also, or even two trees, one at either end of the room, would be most acceptable. When the birds build in the trees, however, you must see that the nests are firmly and securely constructed, or the young will be liable to fall out. 'Tis a pretty sight, to see eight or ten pairs of gay-coloured birds, busily occupied in rearing their tender offspring! Their anxiety, affection, forbearance, and patience, teach us, moreover, a great moral lesson, well worth the learning. *William Kidd, New-road, Hammersmith.*

## WINE FROM THE FRUIT OF THE HOLLY-LEAVED BERBERRY.

I am not aware that the fruit of the Berberis Aquifolium has been previously turned to any useful purpose. I beg, therefore, to send you the result of an experiment with it, on a small scale, which may prove interesting. This very pretty evergreen may not be known to all. I may, therefore, observe that it is a native of North America, that it has compound leaves, somewhat like those of the common Ash, except that they are evergreen and prickly, like the Holly, from whence they take their name. The flowers are produced early in summer, and are succeeded by bunches of berries like black Currants, except that they are covered with a beautiful glaucous bloom.

In my nurseries I had a quantity of bushes which were covered with a profusion of fruit. On tasting it, though its acidity was intense, it struck me that it would make good wine, and the juice staining the fingers like the Claret Grape, made me certain that it would be of a fine colour. I gathered two gallons of these berries, and when picked clean from the stalks, they were bruised, and two gallons of cold spring water added. After that six pounds of lump sugar were put into it, and being covered up it soon fermented, when it was put into a cask, adding 2 lbs. of chopped raisins, and stopping the cask down.

After six months it was bottled off. The result has been a most beautiful home-made wine, rich in colour, similar to the best old port; every one who has tasted it pronounces it *first-rate*, and I am convinced that with age it would well merit that eulogium.

I am also of opinion that this kind of fruit would make an excellent preserve, tying three or four of the bunches together, and boiling them in sugar; they would prove extremely grateful in cases of fevers, &c.

The juice also would make jelly, similar to that of black Currants; and very probably, from the medicinal qualities of the Berberry, it might be highly useful.

I really think that as this shrub is so hardy, and at the same time so cheap, it would be desirable to grow it extensively for wine making. It will succeed in shady places, mixed up in shrubberies, under trees in plantations, where it makes an excellent undergrowth, and would always be worth as much as black Currants, thus adding utility to beauty. I imagine I have not said too much about it, for I think you will agree with me that it is one of the most handsome hardy evergreens we possess. *J. F. Wood, F. H. S., the Coppice, and St. Ann's Well Nurseries, near Nottingham.*

## FOREIGN GARDEN GLEANINGS.

Taurida [Garden, St. Petersburgh.—This garden is not public; it is a piece of ground about 500 yards square, surrounded by walls, and situate at the extremity of the town, near the arsenal. It was designed in 1780 by Wm. Goold for Prince Potemkin. It consists of a pleasure garden, a small park, a school for botany, a kitchen garden, and a large square surrounded and divided by high hedges, which favour the cultivation of early vegetables in wooden pits.

The most remarkable objects in this garden are the hothouses, of which there are 20 of different sizes, all together occupying a length of about a mile and a quarter. The lowest contain Pine-apples, which are cultivated in an artificial soil composed of peat, common mould, horn shavings, and ground bones. This mixture yields a large number of luxuriantly growing plants; 800 Pine-apples are yearly sent to the royal table from these houses. Next in importance to the Pine-apples are the Strawberries; at least 14,000 pots of the two varieties Myatt and Roseberry supply dessert to the Emperor.

There is a house set apart for Cucumbers, which are in great demand in Russia. The English variety, which requires less light, and yields very fine fruit, is preferred; its cultivation is begun in January; its fruit is gathered from February to July.

The houses which contain fruit trees differ much from each other in both height and form. Fig trees, Vines, Gooseberry and Raspberry bushes are in the lowest; Cherry, Plum, and Pear trees occupy the houses of middling height; and the highest contain some Peach trees more than 30 years old, and the stems of which, themselves about 35 feet high, do not branch lower than 15 feet from the ground. The trees bear abundantly, and the upper branches amply compensate for the absence of those usually found nearer the roots; I have myself seen them in the middle of June covered with fruit, and have looked with admiration at the extremity of the wooden walls which support it covered with Peaches of as fine a colour as any we have at Montreuil.

If Peaches are cultivated in lower houses than those I have just mentioned, the trees, in order that there may be a sufficient access of light, must be trained to the roof of the houses. In this way are obtained beautiful arcades of Peach trees, similar to those which are in our country made with the Vine and Honeysuckle.

With respect to Russian pruning, we may say with perfect truth that the art of pruning is very little understood by the Russians; they cut and hack without in the least regarding the laws of vegetable physiology. It is consequently only at a great expense of money consumed in producing an artificial climate and at waste of ground, that they obtain results arrived at by our own clever gardeners in a space not a tenth part so large as theirs. Another considerable object of cultivation in this garden are forced shrubs, with which the Emperor's apartments are decorated in winter. Those most in demand are the four-season and other Roses.

I cannot finish this article without noticing the 40 beautiful Orange trees which the present Emperor himself bought at Palermo a few years since; 20 of these trees are in the Tauride Garden. These trees were taken up with the earth attached to them; the strongest branches and roots were cut away. As soon as they arrived at St. Petersburgh Mr. Gray, the head-gardener, immediately placed them in some earth obtained from Mount Etna, in a house perfectly heated. All grew well, and produced remarkable branches; their stems are now 8 to 9 feet high, and 6 inches in diameter. *Masson's Report.*

## TRADE MEMORANDA.

Who are Thomas Warburton and James Barnes, of 14, Horse Market-street, Warrington? Perhaps some of our friends in "the trade" can inform us.

## Home Correspondence.

*Spurring Roses and hard-wooded Plants.*—There may be nothing very novel in my practice of assimilating the treatment of many hard-wooded plants to that of Roses; but I have been to many establishments in which it has not been adopted, and it may, to some at least, be information when they are told that almost all hard-wooded subjects may be brought as completely under the control of the knife as the best habited of the varieties of the Queen of Flowers. I do not propose to notice all the families which flourish under such treatment; but experience has taught me that many plants, inclined to grow rambling and bare at the bottom, can be grown as fine, as shrubby, and as well furnished, for many years, as a young specimen grown up to perfection; and that, too, by simply treating them as we treat Roses. But they must be commenced with as we mean to go on. Let me begin with the Camellia japonica, a splendid Evergreen, generally spoiled at the onset, because all of us like to see the bud or the graft make wood early, and because it grows to a terminal bud, and sets for bloom, we have no heart, as it were, to deprive ourselves of its flower; the upshot of this is, that we have a foot of the new growth, the lower part being sacrificed to great expenditure of vigour, demanded by the flower, and, therefore, naked. Now, the plan I adopt with a plant which has made its first growth, and, it may be, set for bloom, is to cut the ripe wood down to the three lower leaves, before the bloom-bud even swells. Not one plant in 10 fails to make three vigorous shoots, which, the second year, will be as strong as the one worked branch was the first. The second year, I cut the two lower ones down to two leaves or joints, and the top one to three. This operation rewards me in the third season's growth with two shoots each to the lower ones, and three to the centre one. I am not now entering into the shifting that is annually necessary, because it does not affect the question of pruning; but, independently of these seven shoots, there may be laterals, and if they come too close or crowded, the spare ones should be rubbed off before they share any of the strength that may be wanted for the principal branches. The chances are, that I have a bloom-bud at the end of every shoot, and this third year I allow them to bloom; but, if there be two flower-buds close together, I pinch one out. If the shoot by the side of the flower makes an early push, which is the case with many varieties, I take it away; because I do not want to waste in growth the strength required for the blooms. As soon as the flowers decay, I cut all these seven down as before, regulating them to one or two (or occasionally even to three) eyes or joints, according as I see the plant requires, or does not require, branches. Every year I prune my plant as carefully as I would a Rose, cutting away all weakly shoots, and, as the new growth commences, rubbing off all the buds that are growing where I do not want branches. The Fuchsia (which gardeners seem to stake their credit on growing as fast as they can, and producing a large plant from a cutting in a single season) requires the same care as a Camellia or a Rose. We ought to form the plant from the first, only, as it is a rapid grower, we may begin to form it by pinching out the leading shoot as soon as there are three or four pair of leaves; yet I prefer allowing it to have its season of growth, and ripen its wood. It may be that lateral branches have grown out near the bottom, and some varieties are of such fine habit, that we can hardly improve them; but at the end of the season of growth, I let them rest, and before they make their spring start, I spur in all the strong side shoots to two or three eyes, and cut away weakly branches close, pruning down the centre shoot to three or four eyes above the highest spurs that I leave. The only objection that can be urged against this treatment for Fuchsias applies to but few varieties. There are some too succulent, but they will all ripen the greater part of their wood, and many will be found hard and perfectly ripe before they make the spring growth. Once get a Fuchsia to a good-shaped skeleton, as it were, and you may prune every year with the greatest advantage. I have in the Fuchsia mentioned the least favourable plant for my treatment, but I have never found it to fail in producing compact and well-furnished plants, prolific in bloom, and requiring no props. The Weigela rosea, which I have seen exhibited as a large bush, well flowered at the top, but sadly naked at the bottom, ought to be treated precisely as we should treat a Rose. The very first year that it may be called a plant, cut the main stem down within 4 inches or even 3 inches of the pot, and whatever strong side-shoots there may be, should be shortened to even less than this, even to two or three eyes, while any weak ones should be removed altogether very close to the stem. This cut-back plant will throw out numerous shoots, and every shoot will flower. I have bloomed this plant the second season (so cut back) profusely. Let it make all the wood it may after blooming, but you should cut out all the thin shoots and spur back all the strong ones. The only guide you need have will be the form of the specimen, for it is always advisable to prune away whatever is out of shape, without reference to anything else. The Weigela rosea will flower not only to the bottom of the wood, but the very shoots, that will, like suckers from a Rose, break out below the soil, will bloom also; but let the plant grow its own way, and it has far from an ugly habit, and all the lower eyes will, like those of the Rose, remain stagnant, and the flowers be, as they are usually seen, confined to the upper half of the plant. Hovea Celsi is a plant which, above all others, should be spurred; it should, however, be stopped while young within three eyes of the bottom, grown slowly, and when the three shoots have made two joints each, pinch off the third. It may be grown then till it completes the shoots, and shows its bloom-buds, when it may rest; but, before it starts into growth again, cut all the shoots back to two joints, and continue this pruning system after every bloom, and before the plant makes its new wood. All the Epacrises, many of the Acacias, Cytisus, Heaths and Azaleas, Hibiscus, or indeed most plants that are not very succulent, will be improved by more or less of the treatment to which we subject Roses, care being taken to prune before the new growth is made; and in plants which push their new growth before the bloom is over, the shoots should be removed, by pinching off the growing part. With Epacrises this is essential, for they would, if allowed, grow some inches above the flowers before they faded; besides, by pinching off the ends of the shoots early, the flowers are more equally developed. In all pruning look well to the form you desire the plants to assume when their growth is completed, and cut in accordingly. I have found the knife as useful in the stove and greenhouse as it is among fruit trees, and I feel convinced that whoever takes a professional pride in good specimens, irrespective of size, will find the most awkwardly growing subjects very obedient, if they begin in time. Under the free pruning system there will be found little need of props, stakes, and wires, every one of which is a blemish; but so long as size is to beat symmetry, and handsome growing shrubs are allowed to be exhibited in frames, and the blooming wood to be bent and tortured to cover an even surface, there will be little encouragement for those who study the habit of a plant, and produce it as it should be grown without unnatural training. So long as a plant can be grown to support itself, so long ought any specimen unnaturally supported to be rejected; but of this, perhaps, I may at some other time have something to say. *Victoire Jansin, Rue Montmartre.*

*Stove Aquatics.*—Pekin is 40° North, and Astrakan is 46° North. Therefore Nelumbium Caspium or Caspiacum (Caspicum is not Latin) requires 6° less of summer heat. Lat. 46° passes halfway between Lyons and Macon in Burgundy; and its summer heat is that which ripens the standard Grape. La Rochelle nearly coincides with that parallel. And I suspect the Volga is colder than France, under the same parallel. Besides which, this assumes the Nelumbium to exist no higher than Astrakan, whereas very likely it grows a day's journey up the Volga. *A. H.*

*Hybrid Rhododendrons.*—About two years ago we forwarded, along with some Fuchsia seedlings, a few leaves of seedling hybrid Rhododendrons, concerning which you remarked at the time, that if the "flowers proved equal to the foliage they would be grand things indeed." We have succeeded in blooming one of the plants, a poor sickly one, which is probably the reason why it has flowered this season. The following is something near the description of it. The truss is very large, each individual floret measuring 2½ inches across, and in outline it is symmetrical and perfect. We have forwarded a flower and a leaf for your inspection. We would have sent the whole truss, only we have this day engaged an artist to take a drawing of it, with the view of having the same published. This hybrid was raised from R. arboreum album, crossed with R. campanula-

tum; the plant is 15 inches in height, and is perfectly hardy, the whole stock having stood out of doors during the severe winters of 1848 and 1849 without a single leaf being injured. We purpose to call it R. Stanleyanum, in compliment to the Earl of Derby. We possess many thousands of hybrid seedlings, crossed in every possible way, and some curious things appear to be among them. Our ambition is to beat the Himalayan species, and we flatter ourselves that we shall ultimately succeed. *John Smith, Foreman to Thomas Whalley, Fairfield Nursery, Liverpool.* [The flower which accompanied this letter was 2 inches across; white, with the exception of a very few small brown dots in the throat, and well shaped. The leaf was seven inches long, and three inches broad, ferruginous below, bright green above, and stiff and leathery in texture.]

*Galvanised Iron Greenhouses.*—We have had them in use here (the residence of J. B. Faviell, Esq.) for these 18 months past, in the shape of a greenhouse, two Peach-houses, and an early forcing-house for Peaches and Nectarines in pots, of which we have a great many. The range is 78 feet long and 21 feet wide, and has a curvilinear roof; but we have also a span-roofed pit, 56 feet long, for Pines and for forcing Strawberries, &c., in. All are glazed with Hartley's patent rough plate glass, and they have answered perfectly; indeed they have surpassed our expectations. In glazing, the squares must not be put in too tightly. As room must be allowed for expansion and contractionone-eighth of an inch ought to be left on each side of the squares betwixt them and the ribs. Such houses have a neat and clean appearance, and as yet I see no symptoms of corroding about them. The following plants are in bloom in them, and look very healthy, viz., Justicia carnea, Begonia Fuchsioides, B. manicata, Cyrtoceras reflexum, Gardenia florida, G. Stanleyana, Inga pulcherrima, bearing about 30 or 40 bloom-buds, and having at present eight fully expanded heads of flowers; together with the scarlet Tropæolum Lobbianum, two Everlastings, Camellias, Azaleas, &c. I shall be happy to show our houses to your correspondent, should it be convenient for him to call on me, and give him any information on the subject that lies in my power. *J. B., Stockeld Park, Yorkshire.*

*Market Gardening round London.*—I am obliged to "Pedes" for his pointing out an error in these papers which had escaped my notice. I stated that the women who carry Strawberries to market on their heads make three journeys from Isleworth to London during the day, which would be 48 miles, but it should have been only two; for I find the middle journey is performed by different women, and this is what led me inadvertently into error. The same women, however, sometimes walk from 38 to 40 miles a day, not bad work, I consider, for the softer sex. *James Cuthill.*

*The Spanish Chestnut.*—Some years ago, I was extensively engaged in the timber trade, and being a buyer of all kinds of wood, the English Spanish Chestnut was occasionally purchased. This, however, only happened when some originally well planted park or grounds, some "Evelyn's Sylvan" was disrobed to make way for the advances of man. The uses to which the timber was applied were these; it was sawn into boards of various thickness, from three-eighth of an inch to an inch and a half, put up in the racks to dry, and then sold, chiefly to the cabinet or furniture-makers; it was, in fact, considered a "cabinet-makers' wood," and, for these reasons, it is usually very straight-grained, and nice working wood, and when dry, not liable to twist or warp much, which quality to a cabinet-maker is desirable; but it has this very serious objection, viz., it is horribly *shaky* wood, that is, it is very liable to split in drying, and when dry, and this is very mortifying to a workman, who, when he has cut his piece to its proper size, and begins to make his small mortice and dovetail, finds his wood to "fly," as he calls it; the Spanish Chestnut, therefore, was always looked upon rather shyly by the cabinet-makers, and was never purchased except at a low price. I should not pronounce the wood worthless, but the tree is certainly not worth growing in this country and climate for the value of its timber. *J. C. M., Liverpool.*—For Hop-poles, the Spanish Chestnut may be considered about equal to the Larch, as respects durability, and it is extensively cultivated for this purpose in the middle of Kent. In regard to its timber, full three-fourths of the trees which attain a size to yield 30 cubic feet of wood and upwards, are what is called in the trade heart-shaken; and this very serious defect is not indicated by any outward signs, as is the case with certain kinds of Elms, which are affected in a similar way; on the contrary, the bark is often smooth and unbroken, and even in the butt end there is often nothing to denote the evils which exist further up the bole. After the saw has been passed a few times up, you will, however, begin to discover its fraudulent character, for you will most likely have more pieces of timber than you expected. Rents in occasional or partial concentric rings, as well as in the shape of others radiating to the centre, will exist to such an extent as quite to disqualify the timber for most of the purposes for which it would otherwise be used. These evils are to be regretted, for the wood in all other respects is equal to Oak, which it resembles. Trees of smaller size are less liable to be heart-shaken, but they are too small for many purposes. It is difficult to account for such defects; it would appear as if the longitudinal fibres forming the trunk were more numerous or more effective (?) than those of a transverse kind; and the fact of the timber rending so easily for laths, palings, shingles, &c., would imply such to be the case. The roof of Westminster Abbey was long supposed to be the Sweet Chestnut, but you have lately told us it is Oak; now, without wishing to re-open the question, if there be no documentary evidence to prove the fact, I can hardly think that any examination of the timbers now can set the matter at rest. Sweet Chestnut much resembles Oak at all times, but the resemblance is increased with age. *An Old Sawyer.*—I have grown Spanish Chestnut for Hop-poles, being the most durable of any wood, and it is planted in Kent solely for that purpose. I have also used it in the place of Oak for posts and ground-sills; and from what I have seen of it I have no doubt it will last as long. The best use I have ever made of it is for floor-boards, for which I believe there is no English timber equal to it; the only fault I have ever found is, that it is very apt to be shaky and cuppy. *H., Watford.*—The contradictory accounts that are current as to the value of Spanish Chestnut timber are easily reconciled. The fact is, I believe, that the timber is of exceellent quality—hard and durable. Unfortunately it is very liable to be (what is called) *cuppy*, that is, there is a singular want of adherence between the annual rings of wood, so that the timber falls to pieces under the saw. This defect is so very prevalent, that among 50 trees you will hardly find one that is free from it. Of course such trees are utterly worthless as timber. *Dorking.*—About the year 1805, I well remember a conversation which passed between my father, a devoted botanist and arborist, and a very intelligent Scotch gardener, named Gregory, who was the manager of the woods and plantations for many years (and, indeed, until his decease), at Milton Abbey, in Dorsetshire, then the seat of George Damer, Earl of Dorchester. The durability, I had almost said the indestructibility, of Spanish Chestnut wood, was instanced by Mr. Gregory in the fact that they had been removing some railing that had been put up with Spanish Chestnut poles, 30 years before, to protect some fences round the plantations in the demesne, and it was with difficulty they could either draw the nails or cut the rails, except with the saw; Mr. Gregory's expression was, that they turned the edge of the axe. Having been a great admirer, as well as a planter of this picturesque and beautiful tree, I remember the more distinctly this account of its properties; and, I believe, it is still a matter of doubt, after much controversy at different times on the subject, whether the magnificent, and yet undecayed roof of Westminster-hall, be not actually of Spanish Chestnut. The extensive woods at Milton Abbey are to a great extent interspersed with Spanish Chestnut, much of which is regularly cut for hurdles and poles, with the Hazle and Oak. The soil is a cold flinty loam, on chalk, and hilly; but the Chestnut thrives all the better in sheltered spots. *K., Dorchester.*

*Malformed Leaves.*—Perhaps the circumstanee of two leaves forming a union (of which I enclose a specimen from a Fuchsia in my possession) may not be rare in the experience of amateur growers of more extended practice than I have had. The question I feel disposed to ask concerning it is, whether this is (as I suspect) an instance of imperfect development owing to insufficient vitality in the plant—or is it a monstrous formation of a merely accidental character? It seems probable that some attention paid to such deviations from the ordinary habit of growth might tend materially to elucidate important facts connected with the laws of vegetation. There are other leaves on the plant in a rudimentary state, which seem also to be growing double. A few words upon the subject would greatly oblige, *K.* [These cases are not at all uncommon; and have been frequently mentioned in our columns. The leaves in question are naturally grafted together by some accidental cause, the history of which is now obliterated.]

*Rain.*—We have had the large quantity of 6.245 inches of rain here in the month of January, 1851, and 30 days on which rain was found in my gauges. The above quantity is the mean between two gauges, one on the top of a tower, 42 feet 6 inches from the ground, which showed 7.201 inches, and the other, 5 feet 6 inches from the ground, 524 feet east of the other, but equally exposed, which had only 5.290 inches. This great difference does not seem to be accountable by any perceptible cause. It may, perhaps, serve to show how very partial rain is sometimes. During the same month, at Bowness, Windermere, 13.283 inches have fallen in fewer wet days, viz., 28. In February, 1848, at Bowness, 13.404 inches fell. *T. S. P., Pembroke Dock-yard, Feb. 5.*

*Parsnips.*—On referring to page 228, for 1850, I find the "Turnip-rooted" and "Le Bâtard Yellow" Parsnips mentioned. I would thank you much if you could inform me whether they are desirable sorts to grow, and I should be likely to get true seed; for I find the expense of trenching for, and taking up, the longer varieties so great that they are hardly worth growing; and, in a wet autumn, there is great injury done to the clay land. *W. T. B.* [The Bâtard or Siam Yellow you will probably not be able to obtain. Any seedsman ought to be able to supply you with the Round or Turnip-rooted, which appears to be the one most suitable for you; it is an early sort, therefore you should have some of the Hollow-crowned for late use.]

*Twigs of Spruce Fir* (see p. 182).—A correspondent complains that his Spruce Firs shed their young branches. I have no hesitation in corroborating your opinion and in stating that squirrels are the cause of the evil, for I have frequently observed the depredators at work; they first gnaw out the young buds when the latter begin to swell, and then they bite off the twig. Perhaps the only way of preventing the mischief is to shoot the marauders whenever you can get at them. *J. P., Stoke Rochford.*

*Conifers, more especially the Deodar.*—I have just read the remarks on Conifers, by "Pinus Gloucesterensis," at page 150; and in reply to his invitation, send some information which may interest him and others, such as "J. H.," who writes to you on Deodars, at page 166. First, as to the variation in the number of leaves in the sheath, I have a Pinus patula with three and four leaves in one sheath on the same branch; though I have not observed this to be the case in any other Pine which I have examined. Situation and soil no doubt influence the habit of any tree; but can these causes go so far as to change the number of leaves in the sheath? I think not: I consider that the variation is rather a freak of Nature. The Deodars mentioned by "J. H." show the influence of soil and situation. I would not go so far as to cut them down; they may yet improve; and I would like to know from "J. H." whether there are any large trees near them; as I have a Deodar about 10 feet high, which is in ground which was a garden about 60 years ago, and which grows much in the way he describes. There being some large trees near it, made me think it was "running away" from them, but now I am rather inclined to attribute its habit to the richness of the soil. The main stem of the Deodar will not run away from the wind, though it may become a little one-sided from the young shoots slashing together to windward, when there is a prevailing wind playing on it, as I have found to be the case here, where the west and south-west winds prevail. As we are speaking of the Deodar, I will put a question, which I am curious to have answered. Is the tree, which is commonly called the Deodar with us, the same tree as the natives of its habitat call the Deodar, or the name answering to it? A gentleman, who was many years resident in the Himalayas, has assured me that there quite another tree is called the Deodar, the timber of which is worthless. The timber of the tree we call the Deodar is much valued there, and plantations are made of it, for the purposes for which we use Larch in this country. In compliance with "J. H's." wish, I send the following dimensions of Deodars, and also of a few other Conifers.

| Name. | Height when Planted. | Date of Planting. | Present Height. | Diameter of Extent. | Circumference of Stem. |
|---|---|---|---|---|---|
| | ft. in. | | ft. in. | ft. in. | |
| Cupressus Thurifera | 1 10 | Oct. 1847 | 7 6 | 8 0* | ... |
| Abies Deodara ..... | 3 6 | Feb. 1846 | 6 0 | 8 0 | At 1 ft. 4 in. from the ground—10 inches.* |
| Pinus excelsa ..... | 1 4 | Feb. 1846 | 7 4 | 5 0 | ... |
| P. patula ..... | 1 7 | Feb. 1846 | 6 8 | 7 6 | 11 inches.† |
| Abies Deodara ..... | 4 6 | Feb. 1846 | 10 0 | 8 6 | ... |
| Pinus insignis..... | 1 10 | Feb. 1846 | 11 0 | 9 0 | 1 ft. 7 ins. at 1 foot from the ground.‡ |

I find that Pinus Austriaca, to which "P. Gloucesterensis" refers, is placed among the "Binæ" "leaves generally two in a sheath," in Knight and Perry's catalogue, which is a very useful little publication. As many will now be putting out Conifers, I hope you will warn them against merely turning out the plants (if in pots) without spreading the roots. Many, I think I may say most growers, are in the habit of leaving the roots of the young tree coiled up in a ball, the shape and size of each pot it is changed from. If the tree is allowed to remain in this state, till the roots become too stiff to be straightened out in some degree, the unhappy amateur, after giving perhaps a pound for the specimen, sees it, after growing luxuriantly for the first summer or so, turned over by the high winds in autumn or spring. Then comes some kind advice: "Put a good strong stake to it;" but the roots, though unable to support the tree, from their being in a wisp about it, nevertheless give a great increase of vigour, having been turned out of the dry pot into the fresh earth, so that the tree goes ahead. The stake does its duty well for some time; that is, it gives the stem an artificial steadiness, so Nature neglects that part, and the tree becomes top heavy. The end soon comes; either the stake rots and breaks short off in some gale, when down comes the petted and protected plant, or else the tree grows till it gets too large and heavy to be supported. The only effectual remedy in such cases is to head down the tree till the part left can support itself, when it soon throws out a new leader. I am glad to see that Mr. H. Waterer professes to move his plants every year; however, people at a distance must get trees in pots, in which case I would advise them to get them young, and turn them out in an enclosed bit of ground till strong enough to plant in their final situation. *Pinus Hibernicus.*—I have planted many Deodars in various situations, some of them have made hardly any growth in two years. Would superphosphate of lime, applied to their roots, be of service to them, and in what proportion should it be used? *Newstede.* [We have no experience in favour or against it with Conifers; it should be tried experimentally.]—Having raised many Deodars from seed, I find that they are invariably pendulous in the leading shoot until the latter is nearly a year old. Thus the last year's shoot is just now beginning to rise, and

* This tree was cut down by frost in the winter of 1848-9.
† Leader cut off by Hylurgus piniperda in 1849.
‡ This had a leader of 5 feet cut off in 1848.

this summer's growth will be pendulous. I find, however, that the stems of my trees are beautifully straight, and the pendulous character of the summer shoot adds very generally to the beauty of the tree. My trees are planted in a poor sandy soil, on an elevated situation. I find they grow, on an average, about 2 feet a year, with a foliage so thick and dense as to be impervious. The colour, a beautiful light green, with a bloom like that of green tea. All the Coniferæ grow well with me, the Douglas Fir growing 4 feet in a year. But no Fir equals the Deodar in beauty. *A Constant Reader, Sussex.*

## Societies.

National Floricultural, *March* 27.—Mr. Arthur Henderson in the chair. At this, the first general meeting, the minutes of the preliminary one were read and confirmed, and such other arrangements as were considered necessary, to commence the business of the Society on April 3d, were completed. In addition to the 54 members already enrolled, the names of 44 new candidates for election were proposed. The first meeting, for the exhibition of seedlings, will take place on Thursday next; and the following censors are specially appointed to attend at 12 o'clock on that day, for the examination of such subjects as may be submitted to their inspection:—Mr. J. T. Neville, Peckham; Mr. C. Lidgard, Hammersmith; Mr. John Fraser, Leabridge; Mr. A. Parsons, Ponder's-end; Mr. J. Cole, Birmingham; and Mr. E. A. Hamp, South Lambeth.

Caledonian Horticultural, *March* 6.—Professor Balfour in the chair. There was a good display of spring-flowering hardy and exotic plants; and the day being fine, the attendance was large. Prizes were awarded as follows:—Nurserymen: 18 Hyacinths, first, Messrs. J. Dickson and Son, with the following varieties: Tubiflora, Lord Anson, Bouquet à Vendre, Mammosa, Voltaire, La Grande Vidette, Orondates, Prince Albert of Prussia, Grand Lilas, La Candeur, Nimrod, Prince of Waterloo, La Patrie, Belline, Pronjuwell, L'Unique, Baron von Thuil, and Emmicus. Second, Messrs. Dickson and Co., with Lord Wellington, Tubiflora, Oscar, Laurens Koster, Charles Dickens, Madame de Stael, Goudbeurs, Bellona, Poniatofski, Amy, Baron von Thuil, Bloksberg, La Grande Vidette, Tullia, Prinz Metternich, Kroonprinz, and Voltaire. Practical gardeners and amateurs: first, Mr. Douglas, gr. to Sir J. D. Lauder, with Lord Wellington, Orondates, Elizabeth de Valour, Prince Albert, Grand Lilas, Voltaire, Tubiflora, and Baron von Thuil; second, Mr. Nicol, gr., Orphan Hospital, with Prince Albert, Nimrod, Emmicus, La Tour d'Auvergne, Baron von Thuil, Grand Vainqueur, and Laurens Koster; third, Mr. Mitchell, gr. to Lady Keith. Camellias: first, Mr. M'Lean, gr. to W. F. Mackenzie, Esq., M.P., with Fimbriata, Carswellianna, Candidissima, Hendersoni, Imbricata, and Double White; second, Mr. Reid, gr. to J. Wauchope, Esq., with Eximia, Imbricata, Fimbriata alba, Restowii, Double White, and Gray's Invincible. The prize for the two best and most distinct varieties of Epacris was assigned to Mr. Reid, gr. to Professor Syme, for two seedlings raised at Millbank, named Christisonii and Thomsonii. For the two finest and most distinct varieties of Cineraria, two prizes were awarded; the first to Mr. Addison, Gosford, for Climax and Lady Prudhoe; and the second to Mr. Mitchell, Ravelston, for Pauline and Cerito. The prize offered for the three finest spring-flowering hardy herbaceous plants, grown in pots, was awarded to Mr. Addison, who produced Narcissus pumilus and Bulbocodium, and Saxifraga oppositifolia grandiflora. For the three best sorts of Pears, fit for the dessert, the prize was gained by Mr. Hamilton, gr. to Sir D. Kinloch, with Glout Morceau, Passe Colmar, and Poire d'Auch. There was a close competition for the prize offered for the heaviest stalks of forced Rhubarb. The first premium was awarded to Mr. Goodall, gr. to the Marquis of Lothian, for six stalks of Victoria, weighing 7 lbs. 9 oz. A second prize was voted to Mr. Henderson, gr. to C. K. Sivewright, Esq., for six stalks of the same variety, weighing 7 lbs. 6 oz., and of excellent quality. There were many excellent productions sent for exhibition only, not for competition, and thanks or honorary awards were voted for them according to circumstances. Messrs. Dicksons and Co. sent a hamper of beautiful Hyacinths, and a finely flowered plant of Daphne Fortuni. Messrs. J. Dickson and Sons likewise sent fine Hyacinths. Mr R. M. Stark produced plants of Acacia lineata and pentadenia, and several other exotics. Mr. Carstairs exhibited a dozen stalks of Prince Albert Rhubarb from the open ground, without protection, weighing 3 lbs., and averaging 9 inches in length. Mr. Handasyde showed fine plants of Helleborus olympicus, Sisyrinchium grandiflorum, Iris persica, new large Russian Violet, &c. There were beautiful plants of Arum triphyllum zebrinum, A. cornutum, Epimedium Muschianum, and other rare Alpines, from the garden of Dr. Neill, Canonmills Cottage; together with a plant of Tussac Grass (Dactylis cæspitosa) in flower. From the garden at Wishaw House, a seedling Camellia, named Lady Belhaven, of a rosy pink colour, well formed, and of good size, having the petals regularly arranged in a spirally imbricated manner. From C. K. Sivewright, Esq., there were eight beautiful Cinerarias, and two specimens of Chinese Primula, showing superior management; and from Professor Dunbar, a peculiar variety of Trillium grandiflorum, with party-coloured flowers of white and green. From the gardens of the Earl of Rosslyn, blooms of promising seedling Cinerarias and several fine Rhododendrons, including the true R. cinnamomeum, and a light coloured seedling of good form raised at Dysart. Prof. Syme sent two beautiful seedling Epacrises; and J. Aitken, Esq., several fine Hyacinths. Mr. Shearer, gr. to the Marquis of Tweeddale, sent four seedling Cinerarias, for two of which, a blue and a purple, a Certificate of Merit was granted. Mr. G. Stirling contributed a fine set of Alpines, including beautiful Scillas, Primula speciosa, and cut flowers of Helleborus olympicus. Mr. A. Forrester also exhibited a collection of Alpines, including the rare Leontice altaica, Primula altaica, and Cochlearia acaulis. Two beautiful bouquets were exhibited by Mr. Jaffrey, foreman at Warriston Lodge. A fine bouquet also came from Mr. Reid, of Edmonston. Several well flowered plants of Cinerarias and Camellias were furnished from the Society's collection. Messrs. R. Thomson and Son sent for exhibition a new portable garden engine; and specimens of Hall's garden netting, for protecting fruit blossoms, were exhibited from the manufacturers. Several new members were elected, and the following communications were read: 1. "On Growing and Preserving Cauliflowers for Winter Use," by Mr. Pender, Moredun. 2. "On the Cultivation of Plants in Sphagnum Moss," by Mr. Shearer, Yester House.

Botanical of Edinburgh, *March* 13.—Professor Balfour in the chair. The following papers were read:

1. *On Lastrea uliginosa*, Newm. By T. Moore, F.L.S. The author endeavoured to show that this Fern cannot be reckoned as a species. He considers it as a variety of *L. cristata*.

2. *Notice of British Hieracia.* By J. Backhouse, junior.

3. *On the Berwickshire Station, for Anacharis Alsinastrum.* By Dr. Johnston.

4. *Report on the state of Vegetation in the Edinburgh Botanic Garden from Feb.* 14 *to March* 13, 1851. By Mr. M'Nab.

Mr. Evans observed the first flowers of Moorpark Apricot to expand on the open wall in the Experimental Garden on the 21st February. The earliest flower produced on the same tree last year opened on the 1st of March.—Mr. M'Nab exhibited flowers of Camellia pæoniflora from a plant growing on the open wall of the Botanic Garden. The plant is 10 feet in height, and the spread of its branches is in all 14 feet. There are at present 560 flower-buds on it. No other variety has been grafted upon the plant; but some of the flowers exhibited were completely white, others completely pink, others with one half white and the other half pink, and some with shades of white and pink in the same petal.—Messrs. P. Lawson and Son sent for exhibition a collection of wax models showing the appearance of the various cultivated Potatoes, Beans, Peas, Kidney Beans, and Onions; also specimens of woods so cut and arranged as to exhibit at one glance the transverse and longitudinal sections of each tree, both polished and rough. The models and specimens illustrated the mode in which Messrs. Lawson purpose to supply articles for the Exhibition of 1851. Messrs. Lawson also exhibited a large collection of coloured drawings, in which the varieties of cultivated vegetables were accurately delineated. The drawings embraced varieties of Turnip, Carrot, Radish, Mangold Wurzel, Beet, Onion, Cabbage, &c.—Richard Innes, Esq., 9, Roxburgh-street, was elected a Fellow.

## Garden Memoranda.

Messrs. Weeks and Co.'s Nursery, King's Road, Chelsea.—An attempt has been made here to cultivate the Royal Water-Lily in the open air. A circular basin, 21 feet in diameter, has been formed for it, and the Lily has been planted. It is at present covered by a three light frame; but it is intended to remove this as soon as the plant has become perfectly established. Since it has been in its new situation it has made two or three fresh leaves, which are about 2 feet in diameter, and apparently healthy. The root occupies a brick tub in the centre of the tank, containing about two cart-loads of loam and river sand. Round this are led two rows of hot-water pipes, and a raised one passes along the frame, furnishing the latter with a surface heat of about 70°, while that of the water is about 80°. These pipes are warmed by a boiler 14 yards from the basin, and which also supplies heat for a range of houses immediately in connection with it. After the frame is removed, it is proposed to cover it with canvas supported on iron rods in such a manner that it can be opened or closed at pleasure. This has been provided in order to guard against very unfavourable weather; but it is apprehended that its use will not be much needed. The basin was constructed in this manner: After removing the mould to the required depth, the bottom was well puddled with clay about 9 inches thick; over this a layer of loose bricks was placed, commencing in the centre, and carrying them up to the top of the basin. The hot-water pipes are raised one brick above the rest. In this way a tank has been made at a very trifling expense, for the culture of the different low-growing stove aquatics which are intended to be placed in it.

Mr. Solomon's Forcing Grounds, Peckham Rye.—Mr. Solomon, who is a large fruiterer in Covent-garden, has established these grounds with the view of furnishing his shop with good fruit of his own growth, instead of depending entirely for his supply on extraneous sources. The whole place is not much more than half an acre in extent, and is nearly covered with glass. One house, a lean-to, about 100 feet long, was full of Grapes, and presented a fine appearance. The Vines are placed one under each light, with their roots spreading into the outside border; the bunches were (March 24), just beginning to colour. They were very large, and appeared as if they would be excellent Grapes. The straw with which the outside border had been covered had just been removed. Straw, as a covering, is preferred here to old tan, which is said to be objectionable on account of its not allowing heat and air to penetrate it sufficiently. No heating material is employed; the only covering the borders receive is a good thickness of long loose straw. Attached to this Vinery is a Strawberry house, which, when we saw it, was full of blooming plants of Keens' Seedling, and for health and show of blossoms it would be difficult to surpass them. This house was succeeded by a third and a fourth, both full of Vines bearing fruit about the size of Peas. In the fifth house, a long one, Vines are planted on the back wall as well as in the front. Lastly, we entered a Muscat house, containing a very fair crop of this delicious Grape; the bunches were large, and will be very forward. The whole of the houses are heated with hot water in iron pipes, and the fuel used is coke. Small coals are not liked; they do not give out sufficient heat, and they choke up the passages and small flues which surround the boiler with soot. In the Pine pits, of which there are several, there was a promising crop of fruit, and all the plants exhibited excellent health. A pit was filled with Cucumbers upon trellises. The sort was Cuthill's Black Spine, which had been in bearing all the winter Another pit, full of Keens' Seedling Strawberries, in flower, being passed through, we entered a small house full of Vines in pots. These had a fair crop on them. The Vines are all painted over annually with a mixture of lime, soot, sulphur, and soft soap, and the houses are also washed with hot lime, which keeps them sweet and clean.

## Miscellaneous.

*On the Composition of the Walls of the Cells in Plants; with Observations on the Potato Disease By Prof. Mitscherlich.*—The change which cellulose undergoes by the action of a peculiar ferment is of very remarkable interest, and characteristic of the substance. This fermenting agent is obtained when half-putrid Potatoes cut up into pieces are placed in water, with portions of fresh Potatoes, and allowed to stand, in a not too cold place, until the cells of the fresh portions begin to be easily separable; it is also formed, though more slowly, when fresh Potatoes, cut up, are set aside, covered with water. The liquid is filtered, and fresh Potatoes, cut in slices, added to it; when these are decomposed, a portion of the liquid may be treated with water, and more slices of Potato added, which soon become decomposed, and in this manner increase the activity of the liquid. Hence, just as in the fermentation of an infusion of malt, the yeast, the fermentative fungus, becomes augmented, so does the ferment increase. It only acts upon the cellulose, which, without any other admixture, forms the walls of the cells of the Potato, which are filled with starch; first, the cells separate from each other, so that it furnishes us with a more convenient and perfect means of obtaining the cells with their contents separate from each other, and facilitating their examination; the walls of the cells are subsequently also dissolved, and the starch particles fall out; in this manner, in 24 hours, a slice of Potato is rendered so soft, to a depth of 2 lines, that this portion can be removed by a pair of forceps, the hard mass of the Potato lying beneath the softened layer; so that this process takes place successively from the outside towards the interior; not by the whole of the Potato being simultaneously permeated by the ferment to the innermost portion. No trace of a fungus can be found in the active liquid; it is, however, full of Vibrions, which may in this case be the effective agents. The author is in the hopes of discovering the substance into which the cellulose is converted; hitherto he has not succeeded in obtaining it. Exactly the same process as that which we can produce spontaneously, occurs in the Potato disease, which, during late years, has done so much mischief. In this also, the cellulose, and not the starch

is decomposed; and the liquid, which the author had kept for a long time in contact with one of the diseased Potatoes, immediately produced the decomposition of a sound one. This decomposition is, therefore, not the disease itself, but merely the result of it. Its cause undoubtedly depends upon the dying, or the previous death, of the entire plant; and just as it is well known in the case of other plants, that they die when the apices of their roots are too strongly cooled, so may a sudden cold rain, following a long warm winter, produce a similar condition of the Potato plant. There is another solution of cellulose, which is also of peculiar interest in regard to vegetable physiology,—cellulose which has been deposited; and when the walls of the cells consist of it alone, the entire walls of the cells become dissolved and disappear. This may be most distinctly and beautifully traced during the germination and development of plants, when taking place at the expense of substances which have been deposited. Seeds of the cerealia are allowed to germinate in contact with water only, by causing the grains first to germinate between pieces of wet paper, and then to develope themselves in glasses filled with water; a glass plate, furnished with small holes, being placed upon the surface of the water, the roots are placed in these holes, the grain resting upon the plate. In this experiment, the alterations undergone by the starch itself may be observed; in three or four weeks it is seen that the point of the first leaf begins to turn yellow. This is a sign that all the starch is consumed; if the grain be examined, the interior is perfectly empty, not only the starch, but also the cellulose having disappeared; the plant continues to live for a certain time, the young leaves being nourished by the absorption of the constituents of the older ones; the plant, however, soon dies, because it cannot obtain in this manner those constituents derived from the soil, which are necessary to its nutrition; in the Potato disease, the cause of the death of the plant may be the death of all the delicate points of the roots, when they are consequently unable to derive the requisites for the continuance of their existence and their development from the soil. In the parent Potato plant, during the development of a new plant from it, absorption of the cell-wall does not take place; usually a considerable part of the cells is still full of starch, so that for the new plants to be developed, so as to acquire their independence, a portion only of the parent Potato is requisite. The absorption of the cellulose takes place also in pith; the walls of the young cells of the pith of the Elder consist entirely of cellulose in the spring, whilst those of the previous year no longer contain any of it. *Ann. der Chem. und Pharm.*, lxxv. p. 305; *Reports of the Berlin Academy*, March, 1850, p. 102. *Chemical Gazette.*

*Bedding Calceolaria.*—I beg to recommend to your readers Calceolaria Kentish Hero as a bedding-plant. It is one of the very best for the purpose with which I am acquainted. I took up a bed of it on the 15th of last November, which had been in bloom for several months, and it was then quite a blaze of beauty, although there had previously been a smart frost and much rain, so that nearly every other bed had become miserably shabby, except the hybrid Anemone between japonica and vitifolia, which is also a beautiful bedding-plant, and flowers very well in damp situations. The Kentish Hero is of a bronzy colour; it is partly shrubby, and belongs to a section of the genus more prolific, as regards a succession of bloom, than either the true herbaceous varieties, or those from rugosa and integrifolia. I would advise those who have it not, to procure and make the most of it; one good plant bought in now would furnish dozens for bedding against another season. It strikes readily at any time in a very slight bottom heat. One thing requires notice, that the plants should be well supported with sticks when out of doors; otherwise, as the trusses are large, when the flowers get filled with rain, the stems are apt to break down. *Beck's Florist and Garden Miscellany for* 1850.

## Calendar of Operations.

*(For the ensuing week.)*

### FORCING DEPARTMENT.

Vineries.—Attend regularly to stopping and tying the shoots and thinning the berries. In regulating the bunches, it is well to consider whether a few very large ones will or will not be more desirable than a greater number of smaller bunches. Gardeners usually find those of a moderate size, averaging little more than a pound in weight, more generally useful than very large ones, from the greater facility with which they may be set on the dessert dishes. For this reason, the long, diffuse shoulders of very large shows should be removed; and the loss in the weight of individual bunches will be amply compensated for by the greater number of useful ones, and the larger size of the berries. Examine the state of the inside borders as regards moisture; and in this do not be satisfied with the appearance of the surface, which is frequently kept moist by syringing, but examine the soil 10 or 12 inches lower down. If any water is necessary, use manure water at 80°. If the border has become rather dry, the impulse given by this will be immediately visible in the vigorous and rapid expansion of shoots and leaves. Peach-houses.—Take care that the inside borders do not get too dry, but supply them with liquid manure as often as the state of the soil requires it, previously loosening the surface, that the water may penetrate all parts of the border equally. The period between the setting and the stoning of the fruit is a critical one, and during that time they should not be hurried forward by undue excitement, or they are very liable to cast their fruit; but after this stage is securely passed, they will stand almost as much heat as a Pine. They delight in a high, humid atmosphere, if accompanied with abundant ventilation. Cherries and Apricots.—Where fruit is swelling, maintain a night temperature of 55°. Give abundance of air, and on fine afternoons close at 80°, and syringe immediately with clean water. These fruits require to be forced very gradually, and a high night temperature should be carefully avoided. Melons.—Pits or frames heated by linings, will require to be well watched, and some stable-litter and leaves in a warm state should always be in readiness to renew the linings whenever the heat is perceived to be declining. Beds made wholly of dung should be about 4 feet high at the back and 3 feet at front, as, if made lower, they are more difficult to keep warm. The temperature of the pit should be about 68° to 72° by night, with a little ventilation, and 80° to 90° by sun heat during the day, with a freer admission of air, according to the state of the extreme atmosphere, and with a bottom heat of 80° to 87°. The soil, which should consist of fresh loam of medium strength, that has been sweetened by exposure to the atmosphere for two or three months, should not be watered much at this early period of the season; as, when once the soil becomes soured by too much moisture, the health of the plants will soon suffer irremediably. Previous to watering ascertain the state of the soil to some depth, and if, as it will generally be found, the surface only requires moistening, it should be sprinkled with a syringe or fine-rosed pot at shutting up time; but when the entire bed of soil becomes too dry, it should then be thoroughly watered. Attend to the thinning and regulating of the shoots of those which are now advancing, keeping the leading shoots a considerable distance apart, so that the fruitful laterals may not be too much confined. After a sufficient number of fruit has been set upon each plant, and they seem to be quite safe, let the laterals spread freely, so as to cover the space allotted to them; as a large surface of foliage exposed to the full action of the sun, without being crowded, will give greater size and better flavour to the fruit. Our own plan is to put the plants in close to the front of the pit, and train the leading shoots under the centre of each light, until they reach the top of their trellis, when they are stopped, and the laterals allowed to fill up the remaining spaces, taking care that no leaf overshadows its neighbour.

### FLOWER GARDEN AND SHRUBBERIES.

Finish planting out biennials and perennials from the reserve garden, and dividing large batches of herbaceous plants. Plants of these kinds, including Hollyhocks, Delphiniums, &c., must be carefully guarded against the attacks of snails, by forming a ring of soot and lime round the plants, and scattering a little over the surface of the soil. The decaying remains of last year's stems should also be removed, and the soil neatly levelled round them, to destroy any lurking places which the enemy may have about the crowns of the plants. The Hollyhock is now becoming a general favourite in the flower garden, owing to the pains which florists have lately taken to improve upon the old common varieties. To grow them in perfection a deep rich soil is necessary; and if the ground about the old plants does not answer to this description, let it be improved by forking in some well-rotted dung; and during the growing season, let the plants have frequent waterings of liquid manure. Borders of mixed herbaceous plants are very appropriate and beautiful in certain situations, if tastefully arranged as regards height and habit of growth, colour, and season of flowering; but owing to a want of attention to these particulars, beds of this kind are generally considered dull and uninteresting. It is impossible to effect a proper arrangement of the plants, unless some means be adopted of distinguishing them when they are in a dormant state, by correctly naming them as they come into flower, and taking memoranda of their height, colour, season of flowering, and other peculiarities.

### FLORISTS' FLOWERS.

Dahlias.—These should now be in active operation. Start the main roots in a hot-bed, and remove the shoots when two or three inches long, placing them round small pots in sand, and plunging them in the bed. Keep close, and they will soon be sufficiently rooted to pot off. Tulips.—Showers, accompanied with hail, and sometimes frost, may be expected; therefore, take particular heed as to the state of the weather. It is an easy matter to put over a few mats, should there be frosty indications; and as the buds are rising in the foliage, they would be seriously injured, and perhaps the hopes of the season be blasted, for want of the necessary precaution. Auriculas.—Nothing better than abundance of air at all favourable opportunities. Do not forget some liquid manure, made from sheep droppings; it is efficacious and safe. We do not recommend at this season moving the surface soil with a "peg;" it is sadly detrimental to the fibres.

### KITCHEN GARDEN.

Young seeds of the Brassica family should be carefully guarded against the depredations of birds, by covering them with netting, and from the attacks of slugs, by sprinkling a little lime and soot among them. Tomatoes and Capsicums should be sown in heat, and potted off, three plants in a four-inch pot, in a rich loamy soil, as soon as the young plants will bear handling. Seakale should now be sown; or the strong roots of old plants that have been forced may be cut into pieces about two inches in length, and put into pans or boxes in a gentle heat, until the young shoots appear, when they may be gradually hardened. They should be planted in rows two feet wide, and one foot apart in the row; having first rubbed off all the shoots but the strongest. It is advisable always to save the roots of forced plants, until the seeds, if any have been sown, have proved good. While the ground is so wet, it will be well not to do much upon it in the kitchen garden, especially where the soil is of a strong retentive nature. The renewing of box and other edgings, and cutting hedges, &c., may now be proceeded with, as this work can be done without going much off the walks. Damp days are also favourable for a general brushing up of the turf previous to rolling and mowing, and for examining the drains from the walks, to see that there are no obstructions to the water passing freely off. There are a great number of little matters to get done during days that are too damp to work upon the ground, which, were it always fine, would be deferred; so that, even at this busy season, a wet day is often the cause of much good being done in a garden.

State of the Weather near London, for the week ending March 27, 1851, as observed at the Horticultural Garden, Chiswick.

| March. | Moon's Age. | Barometer. | | Temperature. Of the Air. | | | Of the Earth. | | Wind. | Rain. |

The highest temperature during the above period occurred on the 3d, 1848—therm. 78 deg.; and the lowest on the 1st, 1838—therm. 16 deg.

## Notices to Correspondents.

Aphides: *M C W.* Cannot you destroy them by means of tobacco smoke? We would try the experiment by enveloping at least a portion of the bed in canvas, and filling the space with smoke from one of Brown's fumigators.‡

Back Numbers. Full price will be given for No. 1, 1843, and Nos. 1, 2, 3, 1846.

Books: *T H.* Begin with "School Botany," by all means. There is a fresh issue of the work, the large and long-continued sale of which proves that it answers its purpose.

Camellia: *R D.* You will find a full account of its culture at p. 21 of the present year.‡

Evergreens: *W C.* You may prune them back about the middle of next month.‡

Fruit-tree Dressing: If an *Old Showman* will mix a little oil with soft soap, he may perhaps find that oil will cease to be oil, but will mix freely with water. Experiments should precede criticism. At the same time we are not defenders of all the opinions which writers and talkers indulge in. Heaven forbid! We give them as we find them, and the public has to judge of their merit.

Fruit Trees: *G S.* Against an east wall you may plant the Moorpark Apricot; Royale Hative and Green-gage Plums; Elton Cherry; Marie Louise, Beurré Diel, and Winter Nelis Pears. Your lately planted Plum tree should not be cut back till next autumn.

Insects: *Anon.* The grubs in your Geranium pots, and in the Grass in the flower garden, are the larvæ of a two-winged fly (Delophus febrilis) which appears in the winged state early in the spring; so that all or nearly all the mischief is now done—that is, if they do any, which we doubt, believing that they feed upon decaying vegetable matter, and not on living plants, in the larva state. *W.*—*A B C.* We are unable to name the cynips, unless you inform us of the tree upon which the gall was found. *W.*

Names of Plants: *Will with a Wisp* sends for examination a part of his own family. The wisp of broad green leaves and white stems belongs to Arum maculatum; the wisp of Parsley-like leaves to some Umbelliferous plant, perhaps Æthusa Cynapium; the wisp of dirt and rubbish to anything you please.—*A Sub.* Solanum pseudo-capsicum, Pittosporum Tobira.—*New Sub.* Ruscus aculeatus, Arabis alpina.—*J G.* Lasiopetalum quercifolium.—*Erzeroum.* The packet arrived lately, and was very interesting. If it was not acknowledged, we must beg you to forgive the omission. We hope you receive Paxton through your friend in Fenchurch-street.—*E P.* The common grey Opium Poppy.

Seeds: *G S H.* You had better send to New South Wales seeds rather than plants. The latter are uncertain of success and expensive; the former are cheap, and, if in loose bags, suspended in a cabin, will arrive with scarcely any loss. If you must send plants, then you must trust to what are called Ward's cases (portable greenhouses), described in our volume for 1844, p. 3.

Silkworms: *T U.* They may be purchased in Covent-garden market.

Transplanting: *J P.* Both Gorse and Fern may be successfully transplanted, provided the operation is performed with the necessary care, and young plants are selected for the purpose.‡

Woodlice: *Reader.* A toad or two placed in your frame will be found to thin them.‡

Misc: *J W.* Public papers have no right to mix themselves with private disputes. Your letter is sent to Mr. F.—*Mrs. M.* The common Borage will suit your purpose best. Cosmanthus fimbriatus is a hardy plant. It succeeds best in a damp situation. ‡—*B.* We cannot perceive any kind of relation between your question and the subjects admitted into this Paper.

### SEEDLING FLOWERS.

Amaryllis: *R B.* A pretty variety of A. vittata.*

Coronilla: *W J S.* Your seedling does not appear to be different from C. glauca. *

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS,

AS THE

ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by Dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | | |
|---|---|---|---|---|
| Clover Manure, per ton ... ... ... | ...£11 | 0 | 0 |
| Turnip Manure, do. ... ... ... | ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... | ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... | ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

PHOSPHATE NODULES, OR COPROLITES AND FOSSIL BONES (from the Suffolk Crag).—Manufacturers of Superphosphate of Lime can be supplied with the above, either in their natural form or finely pulverised, on the best terms, f. o. b. or delivered in the Thames.

Applications to EDWARD PACKARD, Chemist, Saxmundham, Suffolk, will receive prompt attention.

IRISH PEAT CHARCOAL.

TO FARMERS, AGRICULTURISTS, AND OTHERS.

MESSRS. ODAMS AND PICKFORD, 35, Leadenhall-street, having been appointed by the IRISH AMELIORATION SOCIETY sole Agents, for London, for the sale of their PEAT CHARCOAL, beg to say full particulars of prices, &c., may be obtained on application to them.

ODAMS and PICKFORD, 35, Leadenhall-street, City.

DESICCATED ANIMAL MANURE.—This Manure, which has proved so eminently successful in the culture of both Cereal and Green Crops, can now be had of the Manufacturers, J. M'CALL and Co., 60, Spring Gardens, Manchester; RITCHIE and M'CALL, 137, Houndsditch, London; and of all Agents. Price 7l. per ton.—Copies of Analysis and Testimonials forwarded post free on application. Agents wanted.

PATENT CREOSOTED FISH FOR MANURE.—This manure is composed entirely of animal matter. The analysis of an eminent chemist states that one ton of the prepared fish contains 263 lbs. of ammonia, 150 lbs. of phosphate of lime, and 39 lbs. of potash. It will be seen that they contain all the manuring properties of the best guano, and as they cannot be adulterated, they will be found to be a most useful manure for Potatoes, Wheat, Oats, Carrots, and all root crops. They also have the property of preventing the Potato disease. All the Potatoes planted with them last year, produced good crops, and were entirely preserved from the disease, although the neighbouring fields greatly suffered. See Report of the Royal Agricultural Society of Dec. 11, 1850. Price 5l. per ton. Orders received by Mr. HENRY HILL, Corn Exchange, Mark-lane; Mr. GEORGE BUSH, 22, Abchurch-lane; and Mr. BENNETT, 73, Mark-lane, London.

SUPERPHOSPHATE of LIME, Manufactured from Bone and Animal Matter, is superior to Guano for Turnip and other Green Crops, whilst *the cost is much less.* The reputation of this Manure is, however, likely to be injured from the fact of some makers using Coprolites, which is only one-third the price of Bone; yet they try to persuade their customers it is as good as Bone, but it is a delusion—the cheapness of the Coprolites being their only inducement. There are many hundreds of tons of this ground stone now being used annually, therefore the agriculturists should be upon their guard, and only purchase where it is manufactured from Bone, as in these days of cheapness the farmers should purchase only the best Manures.

Those Farmers who have convenience for making their own Superphosphate can be supplied with Crushed Bone and Sulphuric Acid at the lowest market price. H. J. HUNT & Co.

Bone Mills and Manure Works, Broad-street, Lambeth.

Established, 1816.

MANURE DEPOT.—PEAT CHARCOAL.

TO FARMERS, AGRICULTURISTS, AND OTHERS.

G. H. FOLEY, Essex Coal Wharf, Lea-bridge, Middlesex, Agent by appointment to the Irish Amelioration Society, for the sale of the above. All needful particulars will be given on application at the above address.

Price of the unmixed Charcoal, 60s. per ton, sacks included. Mixed with Nightsoil, 45s. per ton, sacks included.

FOR PUBLIC SALE, at the New Corn Exchange Tavern, Mark-lane, on MONDAY, April 7, 1851, at 2 o'clock precisely, by order of Messrs. ANTONY GIBBS and SONS, the Importers, about 600 TONS DAMAGED PERUVIAN GUANO. Catalogues and further particulars in due time, from J. A. RUCKER and BENCRAFT, Brokers, 26, Commercial Sale Rooms, Mincing-lane, London.

HOSE FOR LIQUID MANURE, Fire-engine, and agricultural purposes, made of canvass, lined and coated with gutta purcha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure, it is extensively used at the Government public works; also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND CO. beg to notice their mixtures of GRASS SEEDS for Laying Land down to Permanent Grass, are now ready for delivery. They have reduced the price to 30s. per acre, allowing 2 bushels 12 lbs. to the acre.

Mixed sorts for improving old Grass Land, 1s. 2d. per lb.

Fine sorts, for forming Lawns, 1s. 3d. per lb. Directions for sowing will accompany the Seeds.

GEORGE GIBBS and Co. will feel happy in sending general priced Catalogues of Agricultural and Garden Seeds, on application to 26, DOWN-STREET, Piccadilly, London.

GRASS AND OTHER SEEDS.

THOMAS GIBBS AND Co., the Seedsmen to the "Royal Agricultural Society of England," corner of **Half Moon-street,** Piccadilly, beg to call the attention of their friends to the following Seeds:

Mixtures of selected Natural Grasses for laying down Land to permanent Meadows and Pastures, apportioned to suit the nature of the soil.
Mixtures for portions of Parks near Mansions.
Mixtures for Garden Lawns and Grass Plots.
Mixtures for renovating Old Pasture Land.
Italian, and other Rye-grasses.
White Belgian and Red Altringham Carrots.
Gibbs' new very large Parsnip.
Orange Globe Mangold Wurzel.
Long Red and other kinds.
Drumhead and Thousand-headed Cabbages.
Swedes, Hybrids, and other Turnips.
Clovers, Kohl Rabi, French and English Furze.
Sainfoin, Rape, Tares, White Mustard, and all Agricultural and Kitchen Garden Seeds, &c.

Priced Lists are now ready, and will be forwarded free, on application, by post, or otherwise, to corner of **Half Moon-street,** Piccadilly, London.

**The Agricultural Gazette.**

*SATURDAY, MARCH 29, 1851.*

MEETINGS FOR THE FOLLOWING WEEK.

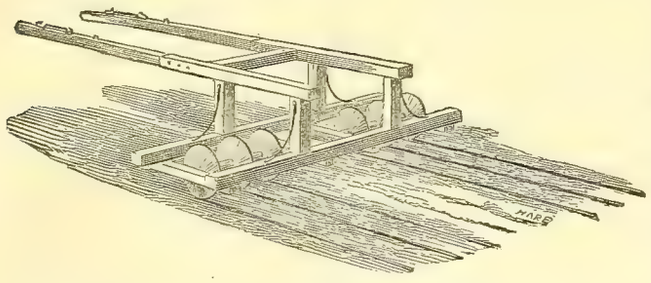
WEDNESDAY, April 2—Agricultural Society of England.
THURSDAY, — 3—Agricultural Imp. Soc. of Ireland.

A CORRESPONDENT asks us, what small farmers are to do to meet the times—"how those who occupy 50 acres of plough land, and 10 or 12 of Grass, of whom there are hundreds in his neighbourhood, cultivating very carelessly, paying a high rent, and, therefore, grudging to lay out 1s. more than absolutely necessary for labour, are to withstand low prices?" Now, this is a landlord's, as well as a tenant's question. The latter, certainly, where small farms are the rule, have hardly an alternative; they must remain; for if they leave their land, no other means of livelihood seems open for them, unless, indeed, they should resolve to emigrate, which, by the way, is probably the best thing that many of them could do; but we may suppose that both the parties to this case are men of business, and able to resolve on what may, on the whole, be best for both; the tenant has the escape of emigration, and his landlord, that of a personal occupation of the land, from the loss to both of non-cultivation—and to neither is his choice a very tempting one. Let them then accommodate their relations to the circumstances of the case; let the "high rents" of their farms be lowered as their produce is in value. Let them be converted into corn-rents; and supposing them in former times to have been converted into grain at the prices then obtainable, let the tenant pay a rent the value of those bushels now. This would be the first step needed. He would be encouraged to exert himself when he had the prospect of success which this would offer.

Our further observations must be directed to the two very different classes under which small farmers may be arranged—the one with scanty means, depending almost wholly on the labour of themselves and families, the other having ample means and employing labour. To both, however, we may safely say, farming is a retail business: your profits, after that large margin is deducted, which skill in marketing allows, will hinge almost entirely upon attention to details—upon the use you make of the *minutes* of the time at your control, upon the mode in which the *pennies* of your outlay are invested; and this remark applies to agriculture on a larger scale as well. If the farmer is to make a livelihood, the longer his experience the surer will he be to bear us out in saying that it must be by constant superintendence of the labour he employs, and the means at his command. Both classes then of farmers on the smaller scale may benefit by this kind of economy. For those who have to fight with straitened means, the "Essay on Small Farms," by the late Mr. BLACKER, of Armagh, and the "Tract on Agricultural Economy, as the Remedy for Agricultural Distress," by Mr. OWEN ROBERTS, are the proper text books. Let them study and adopt the plans there recommended; and, in stall-feeding, in the growth of winter food for their stock, in the proper selection of crops, Rape and Rye and Cabbages, and Mangold Wurzel and Italian Rye-grass, as food for sheep and cattle; and Flax, a crop especially suited for farming on a garden scale, as an addition to the crops they grow for sale; in the adoption of a right rotation of their crops; in a strict attention to the maxims of universal application in agriculture; the destruction of weeds, the drainage of the land, the levelling of useless hedgerows and divisions; and, above all, the saving and the careful use of everything that will increase the dung-heap—they will find their only chance of profit. There is no dexterous mode of extrication possible; it is by careful and attentive plodding in the path which has long enough been known to all good farmers, that their only chance of safety is attainable. They are said to cultivate their land "carelessly;" well, on the substitution of carefulness and energy and industry for this, their only prospect of a livelihood depends. And if any one objects that we are offering them the veriest A B C of agricultural advice, our reply must be, that not the alphabet alone but all of what is useful in the whole literature of agriculture is included in the substitution of intelligence and energy for careless listlessness in farm management. Let no one think that scientific men, or enthusiastic agriculturists, will ever teach him how to make his farming *pay*—they will teach him well how to make his farming yield abundantly of food—they will teach him also to economise his means, and use them economically—and they will benefit him by the excitement, whether of his hope or jealousy—but any benefit they confer upon the art just fans the competition of its practitioners among themselves for the labour and the land on which the prosecution of the art depends; and profits, after all that they have taught us, will then, as always hitherto, hinge upon the personal industry and energy of each. We believe, then, that small farmers of the class referred to would be benefited, if they could be induced to receive the lessons of Messrs. BLACKER and ROBERTS, and apply the rules there given to their ordinary and daily practice.

For those whose means enable them to carry on a still more vigorous style of farming—the use of artificial manures, and the purchase of cattle food—now cheaper than it was, seem to be the likeliest helps. This deep tillage, thorough drainage, and the right selection of crops for cultivation, are the four great points on which the success of high farming depends. We recommend all such to read Mr. CUTHILL's statements in the *Gardeners' Chronicle*, of what these points enable market gardeners, near London, to accomplish.

## A WORD TO THE FARMER ABOUT GROWING WHEAT.



FARMERS, it is said, so far from making a profit from their land, are farming at a loss, and sinking their capital to pay their men. Assuming this, or something like this, to be the fact, I have ventured to publish the results of my practice in growing Wheat. With no earthly object in view, but the fulfilment of what I conceived to be a duty, I have shown that, acting on some of the principles of Jethro Tull, while I differ wholly from him in practice, I am making, as droprietor, a profit of 7l.; hoping to increase that profit to 8l. an acre.

This is so startling a result; so much at variance with common experience; of such infinite importance at the present moment, that I have not thought it unbecoming in me to press it on the attention of all earnest men. I ask them fearlessly to prove the system I follow, to the bottom. If it be found healthy, long life to it—if unsound, let it die without pity.

With reference to the call made upon me for further information, I meet it most willingly by the following statement, which replies, I believe, to every question of importance proposed by "Amicus Tull." For other details, if they are required, I refer to the pamphlet itself, which contains them all.

In the first edition of the "Word in Season," published November, 1849, I commenced by stating, "My Wheat is coming up well." In the sixth edition, published November, 1850, I was enabled to say, "The plant of Wheat, which just twelve months ago I described as coming up well, fulfilled its promise. In spite of the midge, the mildew, and the frost, the produce was upwards of 33 bushels to the acre." Seeing this result, after so untoward a season, I took in hand another field of several acres, in order to prove that with suitable implements on Wheat land, the system I followed might be carried out with ease, economy, and expedition, to any extent. The field I speak of had just been in Wheat, and the stubble was standing. It is good useful land, but light; and so far not so suited to my purpose as the strongest clay field on my farm of 400 acres. In other respects nothing could be better. It is very accessible, adjoins the public road, and so is open to constant inspection; and, to make it complete, it has not, I believe, known a bare fallow in the memory of man. Having adopted a set of implements to the cultivation of this field, year after year, for Wheat, I entered upon my work at once. It was now October. Another year I shall be earlier in getting in my seed; the latter end of August, or the beginning of September; that being a security, 5 years out of 6, against the blight. I first ploughed the short stubble an inch deeper than the used staple. After harrowing and cleaning and levelling the whole, I marked out the channels for the seed with my presser implement, which is drawn with one horse, and presses two lands at once. The following sketch gives the frame of the implement, with the presser wheels at work; the channels for the Wheat being one foot apart, and the intervals three feet.

My scheme of implements, to be complete, embraced a drill, which was to act immediately behind the presser wheels, and to drop seed by seed into the hard channels. The spindle of the presser was to turn the drill wheels, and the boxes were to be made removable. Being unable to accomplish this in time for the first year's sowing,

I had the seed, as heretofore, dropped by hand, and covered over and heavily compressed by rough roller-wheels, or crushers. I will not repeat here my published description of these rollers, or of the implement for hoeing and stirring between the rows of Wheat, or of the scarifiers and harrows for moving the intervals, and levelling them for seed time. It will be enough to state that each of these implements is applicable to the frame which contains the presser wheels, and is made removable to make way for the others in their proper season.

In all the various operations performed by these implements, the sown lands, and lands about to be made ready for sowing, are untouched by the foot of man or horse. The horse walks in the alley or interval. While the implement is pressing or rolling the lands, the driver is seated on the frame. When it is hoeing or scarifying, the driver walks, with reins, behind, and by means of moveable handles lifts it at the turnings. It is easy to calculate from the space covered by the implement frame, the time occupied in these labours. I found that I heavily pressed an acre within 40 minutes, and went through the other operations in about 20 or 25.

It is clear, then, that, so far, the scheme I advocate and adopt, might be carried out easily, economically, and expeditiously, to any extent. But, there is one important process, unconnected with these implements, and necessary to my plan, which requires comment. The seed having been sown and covered over, and springing up, the fallow was prepared for the following crop. The 3 feet intervals were tilled. And to do this effectually there is no implement but the spade. The process with this is very simple; and, after a little practice, very easy and safe. The spadesman first throws out on the edge of his headland a certain number of spits, say to the length of 3 feet. Having finished his first interval, the same length of 3 feet will be left open at the end. Beginning a fresh interval at that end of the field, he casts the first spits of this second interval into that open space; and so continues to deal with the ends of each interval all through. Before commencing a spit, he makes a cut about 4 or 5 inches from the outer rows of Wheat, the back of his spade being towards the rows, and then proceeds with his digging. And it was a pleasant sight to see my gang of six men working cheerfully side by side, and throwing up the soil into loose ridges 8 or 10 inches higher than the tender Wheat, as if for the sole purpose of protecting it. Nothing but the spade could do this. Nothing but the spade, within the limited space of 28 or 30 inches, can turn up the subsoil from the required depth, and place it uppermost in such a form as to receive the full benefit of the frosts of winter, and the rains and dews of summer. That exposure of the subsoil is indispensable. It is to that I look as the cheapest and best means of providing, what would otherwise be inert and useless in the bowels of the earth, the inorganic manure for my Wheat, and of supplying a fresh and inexhaustible store of mineral food. With every inch of subsoil which I thus bring to the surface I am adding 100 tons of virgin soil to the staple of each acre; and I should think it little, therefore, were I forced to linger in this operation, and so pay dearly for this acquisition. Let us look closely, however, and see whether this plan of trenching for Wheat be, in reality, less economical and less expeditious than the plough. I will suppose that, as in the ordinary cases of good farming, there are three ploughings for Wheat. That, at 7 inches deep and 12*s.* the acre, will be 36*s.*; and the time occupied will be three days. What is the difference, then, in point of time and expense, between the plough and the spade? "It will take a good labourer 30 days to trench an acre, and 16 to dig it well." So says one high authority. "With proper instruments, and some experience, a labourer can dig an acre of light land 18 inches deep in 25 days, and even 2 feet deep in 35 days;" says another. "At the large establishment of 150 acres of garden ground at Fulham, the price given for piece-work, two spits deep, is 2½*d.* per rod" (being 16*s.* 8*d.* the half acre). Such is the report of Mr. Cuthill. Now, at the commencement of my trenching a field, I bring up only so much of the subsoil (say 4, 5, or 6 inches, according to the nature of the soil), as can be acted on by atmosphere, and prepared for use by the one year's fallow; increasing the quantity year after year till the staple has become two good spits deep, as is the case with much of my clay land at this moment. And when all has once been loosened in this way, and become light, the calculations I have quoted may be considered correct; with the cheering prospect before us of a diminution of expence hereafter to nearly one-half. Taking, then, the average of these calculations, and commencing with 12 or 13 inches deep, inclusive of the ploughing, the first year, and allowing for obstructions in the variety of soils to be acted on, I reckon that one man at the outset will dig two shallow spits deep, and in after years, by degrees, will deeply double dig an acre in 30 days. Employing, as I do, six men for my work, they would thus accomplish a whole acre in five days; which, at 2*s.* a day each man, would amount to 60*s.* But only the half portion of the acre is to be dug for one year's crop; and this will reduce the time to two days and a half, and the expense to 30*s.* Say, however, that the time and the expense are here underrated, that the time will be three days, and the expense 36*s.*; and even then, in point of economy and expedition, the ploughing and the trenching will just be on a par!

I come now to my fresh balance-sheet; only premising, in reference to one of its details, that I have no peculiar advantage over others, beyond, what is not very peculiar in these days, the use of a machine for threshing.

| | £ | *s* | *d.* |
|---|---|---|---|
| One double digging in autumn ... ... ... ... | 1 | 10 | 0 |
| Three stirrings with scarifier at spring, 1*s.* ... ... | 0 | 3 | 0 |
| One ditto with scarifier and harrow implement before sowing ... ... ... ... ... ... | 0 | 1 | 0 |
| Two pecks of seed, at 5*s.* per bushel ... ... ... | 0 | 2 | 6 |
| Pressing and drilling ... ... ... ... ... | 0 | 1 | 0 |
| Rough rolling ... ... ... ... ... ... | 0 | 0 | 6 |
| Four hoeings between Wheat with new implement, 6*d.* | 0 | 2 | 0 |
| Bird keeping ... ... ... ... ... ... | 0 | 2 | 0 |
| All the operations from reaping to marketing, being for reaping two-fifths of an acre, 7*s.*; harvesting, 4*s.*; taking in for threshing and marketing, 5*s.*; threshing 34 bushels at 2*d.* per bushel, 5*s.* 8*d.* ... | 1 | 1 | 8 |
| Rates, taxes, and interest ... ... ... ... | 0 | 10 | 0 |
| Total outlay ... ... ... ... | 3 | 13 | 8 |
| 34 bushels of Wheat ... ... ... 8 10 0 | | | |
| 1 ton 12 cwt. of straw, at 2*l.* ... ... 3 4 0 | | | |
| Total produce ... ... ... ... | 11 | 14 | 0 |
| Deduct outlay ... ... ... ... | 3 | 13 | 8 |
| Total amount of profit ... ... ... | £8 | 0 | 4 |

Some may demur to the item of 2*l.* a ton for my straw. It is nothing to say I purchase it myself, as I do, at that price; for others may, as they do, procure it for less. I speak of its intrinsic worth, as fodder, litter, and manure to the prudent farmer, who will never part with his straw at all. He has too great a regard for the bulk of his root crops. For myself, I am quite sure I do not reach the just and intrinsic value of good Wheat straw when I place it at 2*l.* a ton.

Many may think I am wrong about manure. Let them hold their opinion still. What then? If they do not believe the atmosphere to be a great reservoir, containing every organic constituent of plants, as nitrogen and oxygen, carbon and hydrogen; if they see nothing in my whole year's fallow, and discredit the fact that every shower and every descent of dew brings down these constituents on the soil, which, on my plan, is ever open to receive them, and so deep as to fix and retain them; if they will forget that this ammonia, and carbon, and aqueous vapour, are still, for another year, finding their way through the well-stirred surface to the roots of the growing plant; if, moreover, they have no thought for the chemical composition of the subsoil, or of the fact that in most cases it is chemically the same with the staple; if they cannot conceive that a gradual exposure of this subsoil to the solvents of the atmosphere is a gradual gain of mineral manure, or that by increasing depth and constant disintegration, this supply of inorganic food is practically inexhaustible;—if, further, they waive the importance of an equable distribution over all the land of food for my plants;—a distribution, which in the one case, by the hand of Providence, is perfect, and in the other, by the hand of man, impossible;—why, let them insist on manure for my Wheat. Manure, ye incredulous, by all means. What then? The success of the system does not hang upon that. Manure; and charge for it. An abundant supply for the half acre could be purchased and applied for 20*s.* Deduct, then, 20*s.* from the balance-sheet; and what remains?—A clear profit still of 6*l.*; and probably, 7*l.*, the acre!

Let me sum up, then, the principal advantages of my scheme for growing Wheat. First, while one crop of Wheat is growing, the unsown intervals of the acre are being fallowed and prepared for another. Next, upon this half portion of the acre, tilled as I describe, there is a yield equal to average crops on a whole acre. Then, for the half portion of an acre there is, of course, only half the labour and half the expense of an entire acre required for cultivation; and, lastly, the hand-labour required finds constant employment for the poor. And if the stout yeoman still objects, that the system from first to last is so much out of his usual course as to be to him impracticable, requiring such unwonted application of head-work as well as handiwork to carry it out, I bid him look to the results, and ask him, or rather bid him ask himself and his own shrewd sense, Is it not worth while? *The Author of the "Word in Season to the Farmer."*

## A WORD IN SEASON,

IN REPLY TO "AMICUS TULL."

My own experience of the permanent improvement given to land from trench ploughing is so decided, and I have seen such striking instances of lasting success, attributable to the uncommon depth the soil has been broken up, that I am prepared to go a great way in supporting Mr. Smith's statements, especially as to the assistance that deep cultivation affords to vegetation in place of manure; and with respect to his figures, I see nothing in all "Amicus Tull" says to invalidate them. It may be true that the first cost of trenching land two feet deep will be from 5*l.* to 9*l.* an acre, according to the obstacles in the soil; and in this way, the annual charges on the land may be taken to be permanently increased 5*s.* to 9*s.* an acre. "Amicus Tull" has evidently had a singular soil to deepen, and his expenditure has been far greater than would be generally called for; but the cost of the after trenchings must not be charged at the rate of the first. Mr. Smith, in giving his annual expenditure, puts the cost of double digging at 30*s.* per two-fifths of an acre, which is nearly 6*d.* per rod; but as the land has previously been made friable to this depth, I consider the labourers using the Norfolk fork can at this rate earn 1*s.* 6*d.* per day, per acre; and this view is at once confirmed by what Mr. Mechi is reported to be doing: "He is employing the poor in digging and trenching up with the fork and pickaxe, to the depth of about 20 inches, the rocky, iron-bound, and macadamised subsoil of his light land, and the price he pays is 9*d.* per rod," or 6*l.* per acre.

Mr. Smith's land is a strong loam, or mixture of clay and gravel, with a considerable quantity of large chalk stones underneath.

With respect to the difficulty of trenching a space of two feet in five, practically there is none, there being a distance of three feet between the adjoining rows of Wheat; and when the whole of the ground has previously been trenched, there will be little increase in the height of the soil from the fresh trenching; and the six inches, from the rows of Wheat to the two feet of trenching, is ample space to protect the rows of Wheat from all mischief.

I must leave to Mr. Smith to furnish the details of his expenditure when called for; I confess I think his estimate too low; and, for this reason, have added 30*s.* an acre, in deduction from Mr. Smith's profit; but "Amicus Tull," on the other side, is evidently too high; he would make the cost of harvesting, threshing, &c., out of all bounds. Taking Mr. Smith's crop last year to have been 33 bushels per acre, and to have realised 40*s.* per quarter, and his straw to be worth 8*d.* per truss, or 40*s.* per ton, I have no doubt that the crop may have been grown to pay a profit of 3*l.* an acre. The quality of the Wheat I understood to be superior, and so I should expect it to be. High manuring often causes blight, and the crop to lodge, and so destroys the quality of the corn; but fine tillage is not attended with the same hazard; on the contrary, very much diminishes it. The last year's crop is stated to be the sixth of Wheat in succession; the land, therefore, cannot be called fresh broken up; on the contrary, it must be looked at as having undergone a most scourging course of cropping.

I cannot enter further into detail, and I have no wish to render a personal inspection of Mr. Smith's practice unnecessary. On the contrary, I would have a practice I think so well of, closely examined; and then I expect others would find, as I did, that the doubts that arise in reading a statement so extraordinary, are at once answered by observation of the practice. I believe a more valuable lesson to the present race of farmers is hardly to be found.

Since I saw Mr. Smith's land, I have had a very great treat in inspecting the farm of Sir John Conroy, at Arborfield, near Reading, where I again find remarkable success in growing extraordinary crops on singularly bad land, based upon two-feet trenching. Space and time are now wanting to me, to enter into details of the skilful direction which is here visible in every part of the arrangements and management. My object, in this paper, is simply to show the advantage arising from deeply trenching of land. I will, therefore, close this letter, by saying, that I am informed Sir John Conroy commenced by expending 1600*l.* in trenching and draining 180 acres of his land; the cost of the trenching could not have been less than 5*l.* an acre, probably it was more; but of this I am certain, that with any amount of dressing without the trenching, this land could not have been made to return near the amount of produce it now returns; and the cost of the trenching must have been paid back again and again by the additions to its returns it has given in the seven years since it was done.

I am satisfied my friend, Mr. Mechi, in trenching his land, is making a permanent improvement, that will go far to change some of his views, especially if he turns the soil completely over; and I have little doubt he has taken this from what he saw at Sir John Conroy's. I hope he will go and see Mr. Smith's practice; he should give the improved Kentish turn-rise plough a trial. *Hewitt Davis, 3, Frederick's-place, Old Jewry, 24th March.*

## THE CULTURE OF THE CARROT.

All deep Turnip soils, of a mechanically light and sandy texture, are adapted for growing a clean-rooted crop of Carrots; thin, light, or heavy soils, with a chalky or rocky subsoil, are not so suitable, as the roots become stringy, and the soil being more adhesive, the expense of harvesting the crop is increased. However, the White

Belgian Carrot produces heavy crops upon the best descriptions of stiff loams; yet the difficulty of securing a plant, with the additional expense of cultivation, causes the preference to be given to land of a lighter texture.

A clean Wheat stubble may be treated in a similar manner as for the Turnip, with the addition of a deep subsoiling; and that the tillage should have earlier attention, both in the autumn and spring, so that a deep and fine tilth is insured by the month of April, which is the usual time of sowing; or, if necessary, this can be deferred until May, particularly on land known to be subject to annual weeds, which will overgrow the young Carrots before they can be distinguished.

If farm-yard manure is used, from 12 to 15 tons may be ploughed in before Christmas, that it may decompose and mix with the soil; raw manure applied in the spring, being found to make the roots grow stringy, and otherwise injure the quality of the crop. If artificial manure is employed (and we use it in preference to farm-yard dung), we can recommend animalised carbon; salt mixed with soot, guano and superphosphate, and these may be mixed with a larger proportion of peat charcoal or turf ashes; and if a portion of the latter has been saturated with liquid manure, it makes the manure more valuable; but we do not recommend any one manure as a specific, but would as nearly as possible supply those ingredients in a soluble form, which are found to exist in the plant, or which are essential for the full development of its growth. To prevent the seed clogging in the drill, it is well rubbed, to remove the bushy particles, and then mixed in the proportion of 4 or 5 lbs. of seed to 2 bushels of powdered charcoal or dry ashes, which is the quantity drilled per acre. Charcoal, from its known property of absorbing moisture, will be found to promote the vegetation of the seed. The width between the drills may vary from 10 to 15 inches. A small quantity of Oats or Mustard, or any other seed that vegetates more rapidly than the Carrot, may be drilled with it, to show the rows, upon land that is much infested with weeds.

The plants are hoed out to a distance of about 8 or 9 inches, and the land is kept clean by repeated horse and hand hoeings, as required. The crop is ready to harvest in November; the roots are forked up by men and women, the tops cut off by a gang of boys and girls, and the roots are then stored by being placed in long heaps, about 2½ feet high and 3 feet wide, which, to protect the roots from frost, are covered with straw, and then with a layer of earth. The produce varies from 500 to 1300 bushels, or from 10 to 26 tons per acre, exclusive of tops. The great art in the cultivation is the obtaining a plant, and the subsequent cleaning from weeds. A thin plant should be ploughed up, for the expenses are nearly as great upon a crop of 5 tons as upon one of 25.

Mr. Hugh Raynbird, in the Transactions of the Highland and Agricultural Society of Scotland for 1850, estimates the cost of cultivation per acre of the Carrot crop as under, upon good sandy and light loamy soils.

Carrots are frequently sold off the land at 5*d.* or 6*d.* per bushel, which will give a good return to the grower. When consumed upon the farm they are very valuable as a winter and early spring food for milch cows, colts, and horses, and for fatting cattle; for these purposes they are superior to most other roots. Independently of the importance of the crop itself, the extended cultivation of Carrots may be advocated, because, the more various the crops upon a farm, the greater is the regularity of the labour required, and the more independent does the farmer become of failures caused by the vicissitudes of this variable climate; the weather which retards one crop may hasten the growth of another; one is attacked by insects or blight, another escapes; while, if dependance be placed solely upon one class of plants, the whole of the year's growth may be visited with destruction at one and the same time. Carrots will assist in giving a more extended and varied character to the rotation of the farmer, which of itself is a matter worthy of attention. A system of cultivation suitable for poor sandy soils will be detailed in a future paper. *H. R.*

## Home Correspondence.

*Industrial Education in Ireland.*—Aware of your desire to advance the agricultural interest, through the medium of the *Gazette*, permit me to notice a scheme of industrial education, steadily ingrafting itself upon the Irish character, and supplanting those fixed habits and prejudices which beget the defective husbandry of the country. Many of your readers are not unaware, that the commissioners of education in Ireland have for some time past combined agricultural instruction with the ordinary routine of literary studies in their schools, and that the lessons inculcated in the school-room are practically borne out in many cases, on small farms varying from 2 to 20 acres, attached to the school. This is the plan, organised, to combat the evils of Irish agriculture, by bringing home to the doors of a benighted peasantry the practical truths of a refined husbandry. It is in such schools where youth can be impressed with the folly of trusting to old and slovenly systems of farming for future comforts, and where the young mind will be indelibly stamped with improved principles and practices of farming. Such a scheme is obviously a radical cure. From the different small agricultural schools throughout the country, the most deserving pupils are drafted to fill the vacancies at the model farm of 130 acres, belonging to the commissioners at Glasnevin, near Dublin—an institution which has been very favourably noticed in Caird's "Plantation Scheme," and Osborne's "Gleanings in the West of Ireland." At this institution the pupils are boarded, lodged, and receive the benefits of agricultural lectures, and literary instruction for one or more years gratis, after which they are prepared to fill situations as landstewards, agriculturists, or agricultural teachers. In this way the commissioners annually train a number of young men, who, when dispersed over the country, become the pioneers of a more healthful system of cultivation. Surely the training of youth to habits of early industry, to science and sense, must favourably react upon the rural ignorance of the land! Surely the teaching of the child the nature of the soil, and its mode of improvement, the nature of crops, and the judicious method of their culture; the nature of manures, their relative values, and different circumstances under which they are applied, are as powerful adjuncts towards the melioration of the country as his acquisition of literary information? The business habits of the after-man must be formed in his youth, and it is by educating thus the rural youth of the country, by establishing in every village an agricultural school and model farm, that we can reach the seat of Ireland's misery—the ignorance of her agricultural population. Agriculture is a nation's sheet-anchor, its prosperity is the standard of a nation's greatness. We, therefore, see how governments are turning their attention to the establishing of agricultural colleges for imparting agricultural information. We see, in Holland, agriculture, scientific and practical, taught in her colleges, as a primary pursuit. Germany, the seat of learning, has long since set the example. American States now raise a cry for agricultural education and model farms, to be extended throughout the length and breadth of the country. York, Durham, Edinburgh, and Glasgow, acknowledge the intrinsic value of agricultural information. The new Irish colleges are provided for means of communicating the same knowledge. And while the example of imparting such useful and daily-required information is set in the higher seats of learning, let us feel thankful that the lonely cotters and small farmers of Ireland have not been forgotten, in having placed within their reach the means of acquiring, both by precept and example, improved notions of husbandry. Among the many philanthropic measures for improving Ireland, we must heartily wish God speed to the steady and unobtrusive progress of agricultural instruction under the Irish National Board of Education. *Well-wisher, March 19.*

*How to produce Five Crops off the same Piece of Ground within Thirteen Months.*—In October plant winter Beans in rows, 30 inches row from row, and at the same time interline two rows of early York Cabbages, which should be sown in June; let the Cabbages be planted 10 inches from the Beans, and 10 inches row from row. The Cabbages to be drawn as Coleworts during the winter, and early in spring. As soon as the Cabbages are off, which should not be later than March, immediately plant a row of Ash-leaved Kidney Potatoes between the rows of Beans. The Potatoes will be ready to harvest in July; as soon as they are taken up fork in a little rotten manure, and transplant a row of Swedes, taken from a bed, which should be previously sown for that purpose. As soon as the Beans are harvested, remove them as soon as possible, and after manuring and well stirring the soil, immediately sow a row of Early Six-weeks, or Stone Turnip. The Swedes and Turnips will be ready to betaken up in November. Thus five crops can be procured, from the same piece of ground, within the space of 13 months. *W. G. E.*

*Drainage under the Acts.*—I can hardly believe that "Fossa," of January 5th, p. 58, of the *Agricultural Gazette* for the current year, is the "Fossa" of your Number of March 8th, p. 155. The first is for drains, 20 feet apart; the last never hints at a narrower interval than 30 feet. The first is for stones on the top of the pipes. "I have adopted it," he says, "and found it answer admirably, and am not aware that any valid reason has been assigned for the objection which is made to the use of stones on the top of pipes." The last says, "I do not advocate stone draining where pipe draining can be done more economically. I have put in hundreds of thousands of pipes where stone could be had a few hundred yards off for digging and carting." My letter of February 8th, p. 91, was solely directed to the preventing the evil effects of "Fossa's" recommendations, to use stones on the top of the pipes. I am not vain enough to suppose that my few hasty lines have had the effect of converting such a veteran practitioner as "Fossa;" but somehow or other he has been converted, not only from the use of stones on the top of the pipes, in so far as it improves the work, but also to "wide intervals"—30 feet draining, which he formerly objected to "having always been disappointed with wide interval draining on stiff clays." He is now content to rest the use of stones on the tops of pipes upon the simple ground of convenience, and then only in those cases where they are dug out of the land. "Surely," says he, "it would be economical to bury those stones on the spot, and take the chance of making the soil a little more porous and pervious to the surface water. I am pretty extensively connected with three counties, and have good opportunity of knowing what is the practice in several others, and in each and all the stones amply pay for carting off, as the road and highway surveyors willingly give 1*s.* a yard for them. "Fossa" says they are of no value with him. This I am quite ready to take upon his word; but I would recommend those who are disposed to try the burying system to look out for another grave than the drains afford, as they may chance to break pipes, or make a channel for the passage of silt into them. I am sorry to find that "Fossa" has had so much trouble, and has gone into such inglorious researches to discover the data upon which my calculations were founded, in consequence of the printer having put "rods" for "roods," meaning thereby roods of 8 yards—the common measure here; but which I am ready to admit I should have converted into imperial measure. The data which I founded on were precisely those which "Fossa" supplied himself in the successful experiment made "to test the absurdity of a whim of our own." In describing this, he says, "We decided on using those stones in the drains by placing them from 20 inches to 2 feet thick on the top of the pipes. The drains were cut 3½ to 4 feet deep, and 20 feet apart." Now 90½ roods of 8 yards are equal to 132 rods in round numbers—that is, the number of rods in an acre, at 20 feet apart; and most people will think 1½*d.* per yard (especially if the ground be stony), not a great deal too much for cutting, laying pipes, and filling in drains of 3½ and 4 feet in depth, which is equal to 6½*d.* per rod. Now, as to the quantity of stones required; suppose the drain is cut to fit the pipe with the utmost precision, we shall have above the pipe a cutting 4 inches wide, and at 2 feet above it, 10 inches will generally be rather over than under the width in a 4 feet drain. These figures give an area of vertical section of 168 inches, which will give 93 yards and a fraction for the quantity of stone required for an acre of drains, instead of 30 yards, as stated by "Fossa" in his last letter. It will not do for "Fossa" to tell us that his drains are cut out narrow; it is impossible to do so where he finds enough of stones to cover the pipes 2 feet deep, and the dimensions I have given are under what would occur in actual practice; and in my former letter I did not proceed to extreme nicety of calculation in regard to the stones. I think I have now shown that my calculations were substantially correct as to quantities, as given by "Fossa" himself; and your readers will be best able to judge whether they can get stones picked, sorted, broken, and put into drains for 3*d.* a yard. I now take my leave of this subject, with the satisfaction that I have given "Fossa" the opportunity of admitting that he in fact had no very clear ideas of the value of stones; and that he by no means "advocates their use where pipe draining can be done more economically." It will puzzle even "Fossa" to show that stones, on the top of pipes, will be more economical than pipes without them. *Agricola Redivivus.*

*British Song Birds: a source of Mischief as well as Entertainment.*—I have read with much pleasure, though no bird fancier, the many articles published in the *Gardeners' Chronicle*, from the able pen of Mr. Kidd; but with much more interest have I read the various statements on "thick and thin seed sowing," put forward from time to time in the *Agricultural Gazette*, and have been, for a long time, a disciple of the thin seeding school, and always, till this season, permanently successful in this species of domestic economy. As I am doomed, I fear, with many others, to pay dear for the whistle of skylarks, who are destroying the young corn in the germ, as we Irish say, "out of a face;" and so full of effrontery are they, they will not yield an inch to the bird watcher's rattle or creak, pebbles from his sling, blank cartridge, nor even well-loaded and primed musketry shots, till actually slain, which, in my case, would require a man on every rood of land, of which I have now sown over 300 acres, and expect to have 500 more sown still before the 1st of May. I have sown spring Wheats with from 42 lbs. to 70 lbs. per acre; Oats, with from 70 lbs. to 84 lbs. per acre, and Barley I hope to sow in the same proportion as Oats, and would be certain of success, as far as an abundance of plants would ensure success, but for the ravages of the larks. I have had a double object in view in this species of thin seeding; first, a saving of seed, being mostly all imported, and of the best kinds, and in the greatest variety; secondly, a gain, by an improvement in the quality of grain, compared to our Irish grain generally; and, finally, as an inducement to the working farmers in my locality to change their system of thick seeding, and a change in their seed; but if a failure will take place, such as I apprehend from the depredations of the larks, and that I can devise no means of arresting these depredations, henceforward I must, as in duty bound, advise a discontinuance of spring corn sowing, lay some hundreds of acres down under Grass for sheep and cattle feeding, and throw on the poor-rates for support some thousands of able-bodied and willing labourers now employed cultivating these crops, all by spade husbandry. To

avert this evil, would it be too much for me to expect from Mr. Kidd, or any other of your excellent correspondents, such instructions as will enable me, by reasonable means, to defeat the deadly efforts of these desperate larks, to render our plagues in this respect worse by far than those produced by the Potato disease. *A Shilmalier, March 20th.*

*Steam Engines.*—I have derived much advantage by the use of a cast-iron pan occupying the ash-pit, and filled with water. The falling embers and intense heat under the ash pit converts the water into steam, which cools the under surface of the furnace bars, and prevents their forming the coal into slag or clinkers. It also prevents the warping and burning of the bars, and economises fuel and labour, besides facilitating the rapid generation of steam. When the coals fuse or run together, they form a solid mass over the vacancies between the bars, adhere to them, and stop the draught. It is then impossible to keep up the steam. Some idea of the coolness thus gained may be formed by the fact that from 100 to 200 gallons are thus evaporated daily, a pipe being always at hand to supply water when required. The abstraction of caloric thus permits a much denser volume of air in the ash-pit, and with it of course a much larger supply of oxygen to keep up combustion. In fact, without this arrangement, we cannot do the proper amount of work. It does away with much of the stoking or stirring, the reflection of the furnace in the water showing the brilliant and unobstructed state of the fire between the bars. The admission of cold air at the back of the furnace, and the facility of iron doors to clean out the flue boiler, gives us an ample supply of steam, without smoke, and with a considerable diminution in the consumption of coal. A 6 horse steam engine, working up to 8 horse-power, with 90 revolutions per minute, requires a quick and ample generation of steam. We thresh and dress four quarters of mowed, long-strawed Wheat per hour. *J. J. Mechi, March 18.*

*On the propriety of laying Land down to permanent Pasture.*—As an Englishman I feel it my duty in these free trade times, to make a few comments on a practice which is now, I cannot help considering, so very necessary; namely, the laying down of arable land to pasture, with the view of meeting, the measures of our present legislators. It is generally admitted that land in this country cannot be cultivated to advantage in the raising of corn for the prices now obtained; the question then naturally arises, what other resource have the agriculturists to enable them to pay the usual outgoings of rent, &c.? I humbly make answer, the laying of their land down to permanent pasture; and I do recommend the system, because, in the first place, the soil will be materially improved by the change, as every experienced man knows; and in the second, the price of wool and meat, being so much higher in proportion than corn, that the latter may be purchased and applied to advantage in the feeding of sheep on the new made pastures; which will not only promote both the increase of wool and carcase, but the improvement of the pasture likewise, and together, return a fair remunerating interest upon the capital embarked, which, under present circumstances, as before observed, it is impossible to obtain from the land when growing corn. Moreover, should, at any future period, the price of corn become sufficiently encouraging as to induce the application of the plough, the land, from the change, the rest, and the enrichment consequent on high feeding, will yield a two-fold produce over the crops it bore at the time when laid down. If what I have advanced be correct, surely it is the interest of the occupiers of land, whether tenant or landlord, to adopt the suggestions here set forth, and devote at once a portion of each farm to pasture, increasing the quantity yearly, as circumstances may dictate; that the change from corn to pasture may occasion the least possible inconvenience and outlay. *Henry Roger Smithe, Eastling, March 20.*

*Flax.*—I was not quite correctly reported in part of my address to the Royal Agricultural Society on Flax culture, and as it may mislead I shall be obliged to you to insert the following: I was reported to have stated, "Flax would grow on a turnpike road." I was showing that it was not an exhausting crop, and less dependent upon soil than any other, but more dependent upon moist atmosphere; and in corroboration, I stated that I could grow Flax on a turnpike road, with an inch of soil, if I might water it every day. May I also take this opportunity of again begging people at this time of sowing, to be sure to procure clean seed, as they value the profit of their crop. I find most of the foreign and much of the Irish seed to have from 20 to 25 per cent. of refuse weeds and dirt; this must be got rid of, on account of the after expense in weeding, and the quality of the crop will be greatly injured. *T. Beale Browne, Hampen, Andoversford.*

*Flax Cotton.*—In some of your late Numbers there has been a good deal of discussion relative to Flax-cotton, and the process for its preparation by M. Claussen. As was to be expected, opinions on the subject are much divided. The statement in your columns by Mr. Beale Browne against the utility of Flax-cotton, seemed to me almost conclusive, but as no probable improvement ought to be checked or intercepted without full evidence and due consideration, I would suggest the following experiment as a test of the advantages thought likely to result from M. Claussen's process; viz., to take half-a-dozen yards of average Flax-thread of No. 16—to divide nto six portions of one yard each—to tie a tight knot at he extremity of the cut ends of each portion—to put he knotted end over a peg or pin, and in the opposite or loop end to insert a hook with a scale, or, preferably, a small tin box to hold various small weights—to add or put in, very gradually and cautiously, small shot, until the portion of thread under trial gave way—to weigh very accurately the hook, the tin box, and small shot—to note down the weight; this to be done with the six separate portions of Flax-yarn of No. 16, and by dividing the weight by six you have the average weight required to break each portion of thread. The same process to be gone through with Cotton-thread, No. 16, and the same process with thread, No. 16, of Flax-cotton. Six portions of each kind of thread will give a safer average than one or two portions, and strict attention should be paid that the three kinds of thread be as nearly alike as possible. It occurs to me that the above Baconian mode of proceeding would give results that might be more depended on than the discussions hitherto carried on. *J. G.* [The strength of the article is not the only point to be determined—the strength relatively to the price at which it might be sold would, however, be likely to guide opinion on the subject.]

*Kohl Rabi.*—I transplanted in a piece of ground of considerable size in my garden, the latter end of last May, plants of the purple kind, without manure or dressing of any sort. Frequent hoeing and watering in very dry weather comprised all the attention they received, and they grew amazingly—I may say luxuriantly—some measuring 18 inches in circumference. I had the large lower leaves cut off (not pulled) from time to time for the cows, like as is the case with Mangold Wurzel; and I took particular notice of one important fact, which was, that the Kohl Rabi were much better able to withstand drought than the Mangold Wurzel growing by their side. The ground dark peaty earth, which is the most absorbent of heat. Your correspondent will find still more information in "Farming Essays" of Mr. Hewitt Davis, on the culture of this plant. *E. T.*

*Produce of Cows.*—I am very sorry my letter respecting the treatment of my cows should have been so ambiguously expressed as to have led to misapprehension respecting them. I meant to say that the produce of them, in butter, was 6¼ lbs. each, or thereabouts, per week; and I attribute so large a produce at this time of the year to giving them a boiled mess, such as I described, with Pea-meal twice a day. My cows are of the Ayrshire breed, and small, and averaging only in quantity under 10 quarts of milk daily from each—the butter, as I stated before, has no taste of Turnips. *A Subscriber.*

*Sheep upon Wheat-plant.*—G. Ensor need not be afraid of putting his sheep upon the young Wheats. The latter part of this month, February, has been a most favourable time; besides the early sown Wheat crops look proud, and the sooner the sheep are turned in upon them the better. The sheep may remain till the field looks bare, and in two or three weeks' time, may be again turned in; the advantage to the crop is very great. The plants will tiller out strong and luxuriant. In farming, we must not be nervous, and alarmed at what may appear rough treatment. I have harrowed Oats and Barley, making some lift up their eyes, and vow the crop would be ruined! No such thing. Fear not. *X. Y. Z., Hants.*

*Advantage of Warmth to Sheep.*—One would naturally suppose that, if kept dry, sheep would be always warm enough with their woolly coats; experience has convinced me of the contrary. I have two sheds—one slated and not boarded, the other slated and boarded under the slates. The latter is some feet lower, and closely confined by walling, having only an open window at one end, and an open door at the other. This shed also contains, besides sheep, a good many pigs, all on open boarded floors. We have all been forcibly struck by the superior progression of the animals in this close, warm shed. So warm, in fact, that on approaching the door or window, the warm blast oppresses you with its fulsome heat, and visitors naturally say this must be too hot and unwholesome. Animals are, however, always healthy here. We have occasionally removed sheep from the other shed, and they more rapidly progressed in the close warm one. I speak of Down sheep during the winter months. The comparison is worth making. So healthful are the open boarded floors, that with 500 head of animals—bullocks, sheep, pigs, calves, dogs, and rabbits, not a casualty has occurred for two months. I have a great aversion to slated roofs, if unprotected internally by boards, felt, or thatch. They are terrible conductors of heat, from the animals in winter, to them in summer. I find sheep, calves, and bullocks do extremely well on Beans soaked 48 hours in cold water, until perfectly soft; they will absorb an immense quantity of water. This saves waste and expense of grinding. We give, in addition, oilcake, straw chaff, and some roots. Beans at 22*s.* 6*d.* per quarter must make cheap beef and cheap manure. My horses have no hay, but 15 lbs. of Bean-meal, and ample supply of cut straw chaff, and 2 oz. of salt, daily. The chaff is moistened from a watering-pot, and the meal adheres to it. Cost of each horse 9*d.* per day, or certainly under 10*d.* *J. J. Mechi, Tiptree-hall, Feb. 25th.*

*Adulteration of Manures.*—This is probably becoming an extensive and thriving traffic; the necessities of the farmer, borne down by unequal competition, being taken advantage of by rogues, to enrich themselves out of his poverty. And there is something like a conspiracy against him; the chemist, who should be his protector, joining, not always unconsciously, in the deception; the certificates of analyses being, as is too well known, often very different from the material sold under them. And what else can the farmer expect, when such analyses are done by tender, at the lowest offer? and even chemists of reputation have lent their names to certificates of analyses, executed probably by their pupils. I have now before me a certificate under a well known and distinguished name, the falsity of which is apparent from mere inspection of the material, so that he would appear to have signed it, without even looking at the sample. This is a heartless deception to the suffering farmer; and not much less criminal than the adulteration itself. The great question then is, to what can the farmer trust? If he gets a sample from the bulk analysed before buying, how can he be sure of having the same parcel? It was suggested years ago (I think by others as well as by me) that he should always buy warranted genuine and to certificate of analyses. When safe in his own possession, mix it altogether, or at least a portion from the centre of each bag; and from this draw an attested averege sample. Bottle, cork, and seal it down at once, and let it be kept by one of the witnesses, under lock. And at the same time, a like sample, to examine himself, by the simple means now recommended by Drs. Way and Anderson. If this simple method detects adulteration, which is most likely with the admixtures commonly used, he can immediately demand redress from the seller. But if genuine, or so adulterated as to elude this simple method, he may use it as genuine; and if it fails upon his crops, then have the reserved attested sample analysed, by a competent and authorised chemist; and if found inconsistent with the warrant, sue the dealer for damages. Of course he must buy from a man who has the means of paying the damages awarded. But now that this adulteration has become a regular business, I think it would be the interest of landowners to put it down by prompt punishment and exposure; buying on purpose, under warrant, from all suspected dealers; drawing an average sample as above, and having it authoritatively analysed immediately; then prosecuting for fraud, and publishing the case in the newspapers. This is just the season for drawing out of the market the whole tribe of adulterators and chemical traitors, and delivering their tenant farmers fcom the brood of harpies now thriving upon their decline. *J. Prideaux.*

*Rats.*—In reference to the observation stating that Mr. Hudson's rats are fed upon Barley, instead of Wheat; rats are said to have been kept out of ricks by laying Garlic at the bottom. I suppose they should be raised from the floor, and the Garlic laid in a stratum of straw—not allowed to flavour the grain. *J. P.*

*Feeding of Milch Cows.*—The above is a subject to which my attention has been much turned, and on which I have read all that I could beg, borrow, or buy; but have not yet fallen in with anything very satisfactory upon it. I want a Manual clearly arranged, by which a plain man, incapable of philosophising or experimenting, may be able to know the best and most profitable method of feeding his cows both as to quantity and as to quality. Youatt and Johnson have given a good deal of valuable information, but their books are above the reach and above the understanding of the class who most need information. What I think would be really useful is a Cowkeeper's Calendar, stating the kind of food, the quantity per day, and the mode of preparation (if any) for each month in the year. The first point would, of course, admit of variations which might be arranged in the order of their respective merits. Such a work by Mr. W. C. Johnson, or some skilful and experienced person, if cheap and lucid, would, I believe, find a ready sale, and be of incalculable service to a large class of industrious men in the neighbourhood of large towns, who, with little or no land, are endeavouring to make an honest livelihood by the sale of milk. I submit this matter to your notice, in the hope that some more competent correspondent of your most useful Paper may take it up. *E. B.*

*Statistics of Cheap Prices.*—It has been suggested that much valuable information on the subject of agricultural statistics could be obtained, if competent persons in many or all the farming districts were to communicate trustworthy facts, showing how many farms have changed occupiers since the year 1846, and what has been the effect of the low prices of corn and meat on the working of the farms by those new occupiers. It is quite certain that vast improvements have been made in the science and practice of agriculture since the above date, and also that much remains to be improved under a wise and proper adjustment of covenants, &c., to be effected between landlords and tenants. In the meantime, it would be highly desirable to ascertain how competent and judicious farmers, who have taken to farm since the abrogation of the Corn-laws, have succeeded or otherwise in their attempts to obtain remuneration. *J. T.*

*The present state of Irish Agriculture.*—In concluding my observations on the Royal Dublin Society, I wish to refer to their annual "Root Show" held in November, where specimens of the different green crops are invited for competition. As the prizes are ever awarded in favour of the largest roots, it is evident much deceit is resorted to in their cultivation—unusual attention devoted—manure unsparingly applied, so that in fact the monster roots produced are in a manner "cooked." Cards are appended to each sample of roots, with the estimated produce per acre, calculated I presume from its forced samples. The poor visiting farmer who comes to learn, is quite bewildered both at the sample and the specified produce—and cannot help saying to himself, "It is all very—very fine;" wishing at the same time, for the soil that produces these specimens. Such an exhibition cannot fail to interest the *élite* of Dublin at

viewing what a plant can be brought to, but if the honest cultivator of roots is to be encouraged, if Irish agriculture is to be improved by Irish appliances, let the prize be awarded to the individual, who, throughout his farm, exhibits the best green crops, raised under the greatest difficulties, and not to amateur farmers or hotbed cultivators. Agricultural exhibitions have been instrumental in a great measure in reforming the pernicious systems of Irish farming. The annual exhibition of the different descriptions of stock will ever afford a practical proof of the progress and advantages of rural improvement. For example, the exposition of agricultural machines for diminishing labour and increasing economic habits—the bringing together of such improved breeds of animals possessing an aptitude to arrive at early maturity, or of fattening quickly on little food, cannot but afford a striking and convincing contrast with those implements of rude mechanism, and unknown design, and of those cattle unseemly in their proportions—unkind in their feeding, and contemporaneous with that pseudo-husbandry which patronizes them. Such is the way to strike at the deep-rooted prejudices of uneducated farmers; such the way to provoke their friendly criticisms—the honest conflict of opinion, which must terminate in healthful results. The proceedings of the exhibition are generally closed, by the convivial meeting at dinner of the several interested parties. It is to be regretted that the majority of the speeches delivered at such dinners are marked by the absence of that superior knowledge directly bearing upon the advanced systems of agriculture, either tending to elucidate an improvement or satisfy a recognised principle. It is equally to be regretted, that the farmers only meet annually at the festive board, where friendly connexions can be so easily formed in new acquaintances. Where neighbour describes to neighbour his system of management for the past, and his intentions for the present year—stating them with an important secresy—with an humble ambition of honest pride—the consciousness of successful industry. Now what better means exist for the self-edification of farmers, than the holding of periodical meetings for the discussion of practical matters, calculated not only to rectify error—to advance improvement, but to corroborate and place on a firm basis scientific truths? It is in such associations as these, where the practical and scientific man can best understand each other's motives, where the former cannot exceed the confines of science's laws, or the latter indulge in impracticable speculations. Here is the place for the landlord and agent to meet and instruct their tenants—to familiarise themselves with their habits and dispositions—to found a confidence in the rectitude of their motives—to conciliate and fix their shifting principles, and shape them into profitable action. But as it is—landlords are absentees from the social meetings of their tenantry—agents are represented by private friends, and thus the homely farmers drink to their "next merry meeting"—conscious of the good it is capable of bestowing, and anxious for its more frequent occurrence. The practical instruction of the adult population consists in sending out practical agriculturists to the most distressed districts in the South and West of Ireland, to initiate the farmers into a better system of husbandry. The plan originated with the Earl of Clarendon, and was executed in the autumn of 1847, and excepting certain intervals—occasioned by deficient funds—continued up to the present. *Libra, Feb.* 11.

*Bituminous Shale Manure.*—For the information of your correspondent "W. B. Harvard," I may acquaint you that last year I tried a number of experiments upon the growth of Turnips with various manures, one of which was the bituminous shale manure. I put nearly an equal value of each sort of manure, and those manured with the shale were by far the worst crop of the lot. These were grown upon light land without farm-yard manure, and I put about 30*s.* per acre value upon each, drilled with the seed. I should think the crop with the shale manure was not equal to more than half of any of the others. Its inferiority was so apparent as to satisfy me that no test by actual weight was required. *W. P. J.*

*Quantity of Water running from the Main Drain* of a 20-acre field, drained 3 ft. 6 in. and 4 ft. deep, the distance between the drains varying from 9 to 12 yards, according to the nature of the soil; 50 gallons per minute, 72,000 per day, 26,280,000 per year, equal to about 117,321 tons. Reckoning that 40 inches of rain (about our average in this part of England) is equal to about 4080 tons per acre, 81,600 tons would fall on 20 acres; deduct 81,600 from 117,321, as above, and the difference is 35,721 tons more of water annually running from the drain than falls upon the land in rain; or, in other words, little more than two-thirds of the water running from the drain is contributed by the rain falling on the surface of that field. *T. W. T., Cheshire.* [Do you state the 26,000,000 per annum as a *fact*, or only as a calculation from the ascertained 50 gallons per minute? Is the latter constant?]

## Societies.

### ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held at the Society's House in Hanover-square, on Wednesday last, the 26th of March. Present: Mr. Raymond Barker, Vice-President, in the chair; Lord Lovaine, Sir Robert Price, Bart., M.P., Mr. H. Barnett, Mr. Burke, Mr. W. G. Cavendish, M.P., Mr. Fuller, M.P., Mr. Gadesden, Mr. Fisher Hobbs, Mr. Maddison, Mr. C. E. Overman, Mr. Parkins, Mr. Pickin, Mr. Rowlandson, Prof. Sewell, Mr. Shelley, Mr. H. A. Smith, and Prof. Way.

The following new members were elected:—

Robinson, Thomas, Burton-on-Trent, Staffordshire.
Mordey, John G., Sunderland, Durham.
Whitford, C., St. Columb, Cornwall.
Pollok, Allan, jun., Broom, Glasgow.
Lloyd, T. D., Bromwydd, Carmarthen.
Gaskell, Charles Thomas, Fulmer House, Gerrard's-cross, Buckinghamshire.
Jones, Edward, Bridgewater, Somerset.
Methley, Willoughby, Heath-court, Blean, Canterbury.
Donovan, Alexander, Framfield, Uckfield, Sussex.

The names of nine candidates for election at the next meeting were then read.

Communications were received from the Marquis of Downshire, the Mayor of Manchester, Mr. Hill Dickson, and Mr. Doulan.

Mr. Key, of Newgate-street, who recently submitted to the inspection of the Council a gutta percha pump for liquid manure, had leave to show to the members, at this meeting, the operation of his new Turnip-cutter, by means of a neat working model, constructed by him for the occasion.

Professor Way kindly consented to deliver a lecture before the members in the Council-room of the Society, on Wednesday, the 14th of May, at 12 o'clock, "On the agricultural employment of common salt."

The Council then adjourned to their monthly meeting, on Wednesday next, the 2d of April.

### METEOROLOGICAL REPORT.—March.

(*Continued from page* 189.)

| Date. | Time. | Max. | Min. | Wind.—Weather. |
|---|---|---|---|---|
| Tues. 18 | 6.53 a.m. | 29.67 | ... | S. a m. Moderate breeze, and raining fast all day. |
| * | 5.5 p.m. | ... | 29.57 | At 5 p.m. WSW.; less wind, and fine. |
| | 8 p.m. | 29.61 | ... | 8 p.m. W. Brisk breeze; fine evening. |
| 19 | 7.20 a.m. | 29.59 | ... | 7.20 SSW. Moderate breeze; at 11, blowing hard at S., and raining fast, with barometer falling steadily, all day. |
| † | 8.40 p.m. | ... | 29.28 | At 8.40 p.m. wind more to E. of S., and barometer apparently rising. |
| | 11.5 p.m. | 29.29 | ... | Night hazy and overcast. |
| 20 | 7.30 a.m. | 29.25 | ... | SSW. a.m. Blowing hard; fine. |
| ‡ | 2.15 p.m. | ... | 29.20 | S. and fine, afternoon. |
| | 8.30 p.m. | ... | 29.20 | S. ditto, evening. |
| | 10.5 p.m. | 29.21 | ... | S. |
| ‖ 21 | 7.30 a.m | ... | 29.16 | SSE. Brisk breeze; showery. |
| | 12.40 p.m. | 29 17 | ... | SSW. Blowing hard; ditto. |
| | 2.30 p.m. | 29.14 | ... | SSW. at 2.30. The wind, which had lulled since noon, recommenced harder than ever, and the barometer had again fallen. |
| | 10.50 p.m. | ... | 29.10 | The wind continued at SSW. all day. |
| 22 | 7.35 a.m. | 28.96 | ... | Blowing hard with heavy rain, SSE., and barometer falling rapidly all day. |
| § | 6 p.m | ... | 28.56 | 6 p.m. ESE. Wind began to veer; ditto weather. |
| | 10.10 p.m. | ... | 28.57 | ESE. Less wind. Densely dark. |
| Sun. 23 | 7.10 a.m. | ... | 28.91 | WNW. Squally. 3 p.m. W. 5.30 SW. Barometer rising steadily all day; stiff breeze, and fine. |
| | 10 p.m | 29.24 | ... | Wind falling light. |
| 24 | 7.10 a.m. | ... | 29.40 | 7.10 NNW. 11.30 NW. Brisk. Fine day; barometer rising steadily. |
| | 10.40 p.m. | 29.64 | ... | Night calm. Barometer still rising. |

* † ‡ All these storms came from the south-west, and from the rapidity with which they succeeded each, must have been of small diameter; crossing Eng and to the eastward.

‖ This storm also came from the south-west, and went off to the north-and-eastward.

§ During the passage of this storm, my barometer fell to a lower point than I have noticed during more than two years; and from the extreme violence of the wind and the opposite quarters from which it blew during the fall and rise of the barometer, I think I may fairly adduce it as an argument (were one needed) of the truth of the conclusions I have arrived at in reference to previous currents, in which a similar change took place, though with less violence of wind, from a southerly quarter, with a falling barometer, to a northerly quarter, rising.

Dorchester, March 26th. *F. P. B. M.*

(*To be continued.*)

## Reviews.

*Flax: its Cultivation and Management; with Instructions in the various Belgian Methods of Growing and Preparing it for Market.* By E. F. Deman, Belgian Agriculturist, and lately Technical Instructor to the Royal Flax Society in Ireland. James Ridgway, 169, Piccadilly, London.

*Considerations for Extending the Cultivation of Flax.* By a Tenant Farmer. Stephen Austin, Fore-street, Hertford.

*Flax versus Cotton,* &c. By John Warnes, Esq. James Ridgway, Piccadilly, London.

We are frequently asked for books on the subject of Flax culture. Now, if any one wishes to know what influence the general cultivation of this crop is expected to have on the national welfare, he may read the last-named pamphlet; if he desires to ascertain whether he may expect any personal advantage by engaging in its cultivation, he had better read the tract placed second on the list; and if he would learn the methods which good cultivators have adopted in Belgium and this country, both of raising the crop and treating it after harvest, he should procure and study the pamphlet by Mr. Deman. Mr. Warnes' argument is, for the most part, levelled, like that of Mr. Ferrand, against the cotton manufacturer, and of course it is, to some extent, inspired by party feeling on the political changes of late years. Had it been written during the present year, which has witnessed M. Claussen's efforts to prepare the Flax for manufacture by the existing machinery of our cotton mills, it would probably have been still more energetic, and rather more practical. The short statement by "A Tenant Farmer" simply directs attention to Flax culture as a profitable opening for the farmer in cases where the cultivation of Wheat and growth of beef may have landed him in loss. And the pamphlet by Mr. E. Deman gives, as we have said, in full detail, the information which is needed to enable any one to cultivate the crop himself, and prepare its produce for the market.

## Notices to Correspondents.

Books: *E D* will feel much obliged if any one will name a good book on the management or diseases of ferrets, as he finds them very delicate animals.

Cows: *D A Cantab.* We should prefer Cabbage to Kohl Rabi per *acre;* Kohl Rabi to Cabbage per *ton.* If you *grow* them at equal expense grow Cabbage; if you *buy* them at equal expense buy Kohl Rabi. Gardner's Turnip-cutter will chop up Carrots; but no cutter will hinder cows from overloading themselves, or even from choking on their food, if they once get into the habit. About horse-stalls next week.

Implements: *Devoniensis.* If you take credit for the value of them at the end of your year, which your inventory on taking stock will give you, then the balance will appear in the loss account of your balance sheet.

Laying down to Grass: *R C.* Your best plan is to till the land, and get it clean, and in good heart, and then sometimes in moist weather, next month, cart on a lot of bits of turf from a good pasture three inches square or so; spread them and tread them in their place right side up, one in every square foot. Roll the land and cart on some compost, and spread it out of the cart, and then sow some Grass seeds, and bush harrow and roll them in; it would sooner be a pasture thus than in any other way, and one acre of good pasture may be made four. If, however, you should resolve to sow and depend on seed alone, you had better use the following mixture for your stiff land, and sow a thin crop of Barley with it:—Aira cæspitosa lutescens, 1 lb.; Alopecurus pratensis, 2; Arrhenatherum avenaceum, 2; Dactylis glomerata, 3; Festuca duriuscula, 2; F. heterophylla, 2; F. elatior, 2; F. loliacea, 2; F. pratensis, 2; Lolium italicum, 3; L. perenne, 5; Phleum pratense, 2; Poa nemoralis, 2; P. trivialis, 2; Trifolium pratense perenne, 3; T. repens, 4; in all, per acre, 39 lbs.

Pigs: *A W.* Mr. Fisher Hobbs, Boxted Lodge, Colchester. The American churn has been advertised in our columns repeatedly. We should suppose any ironmonger could procure it for you.

Tithe Rent Charge: *Anon.* 100*l.* of rent charge is this year worth 96*l.* 11*s.* 4½*d.* Riga Flax seed may be had of any well known seedsman. The cultivation of Flax has nearly been discussed enough in our columns of late.

To Prevent Hens Eating their Eggs: *T W E* says: "I has been found a good plan to suck an egg, and fill it with mustard, of course placing the egg for them to eat, and it will be some time before they will attempt it again."

Why do young Pigs lose their Tails? *Anon.* Your pigs are probably very high bred, and bred much in and in, which causes great delicacy of the skin. A cross with a hairy breed would cure the evil; but perhaps you will exclaim, "The remedy is worse than the disease." *W. C. S.*

## Markets.

### COVENT GARDEN, March 29.

A few Hothouse Grapes, both white and black, have made their appearance since our last report. Good Pine-apples are scarce, and dessert Pears are nearly over for this season. Apples are also scarce. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. A few forced Strawberries may now be obtained. Vegetables of all kinds are abundant and good. French Beans and Cucumbers are plentiful. Carrots and Turnips are good in quality. Potatoes are a trifle dearer. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1*s.* 3*d.* per pottle. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Double Primroses, Stephanotis floribunda, Cinerarias, Moss and Provins Roses, and the different kinds of spring bulbs.

#### FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 6*s* to 10*s* | Oranges, per doz., 9*d* to 2*s* |
| Grapes, Portugal, p. lb., 1*s* to 2*s* 6*d* | — per 100, 6*s* to 14*s* |
| Strawberries, per oz., 2*s* | — Seville, p. 100, 7*s* to 14*s* |
| Pears, per doz., 2*s* to 5*s* | — — p. doz., 1*s* to 2*s* 6*d* |
| — per half sieve, 6*s* to 15*s* | Chestnuts, per peck, 2*s* to 5*s* |
| Apples, dessert, p. bush., 6*s* to 10*s* | — per 100, 9*d* to 1*s* 6*d* |
| — kitchen do., 5*s* to 8*s* | Nuts, Barcelona, per bush, 20 to 22*s* |
| Lemons, per doz., 1*s* to 2*s* | — Brazil, p. bsh., 12*s* to 14*s* |
| Almonds, per peck, 6*s* | Cobs, per 100 lbs., 70*s* to 75*s* |
| — sweet, per lb., 2*s* to 3*s* | |

#### VEGETABLES.

| | |
|---|---|
| Brussels Sprouts, p. hf. sieve, 1*s* to 1*s* 6*d* | Shallots, per lb., 6*d* to 1*s* |
| Cabbages, per doz., 1*s* to 1*s* 6*d* | Garlic, per lb., 4*d* to 8*d* |
| Greens, p. doz. bunches, 4*s* to 6*s* | Artichokes, Jerusalem, p. half sieve, 1*s* to 1*s* 6*d* |
| Cauliflowers, p. doz., 1*s* 6*d* to 4*s* | Lettuce, Cab., p. score, 6*d* to 9*d* |
| Broccoli, p. doz. bundl., 7*s* to 12*s* | — Cos, per score, 1*s* to 1*s* 6*d* |
| French Beans, p. 100, 1*s* 6*d* to 2*s* 6*d* | Endive, per score, 1*s* to 1*s* 6*d* |
| Seakale, per punnet, 6*d* to 2*s* | Small Salads, p. punn., 2*d* to 3*d* |
| Asparagus, per 100, 4*s* to 10*s* | Horse Radish, p. bundl., 1*s* to 4*s* |
| Rhubarb, p. bundl., 6*d* to 1*s* 2*d* | Red Beet, per doz., 6*d* to 1*s* |
| Potatoes, per ton, 60*s* to 100 | Mushrooms, p. pot., 9*d* to 1*s* 3*d* |
| — per cwt., 3*s* to 6*s* | Sorrel, per hf. sieve, 6*d* to 9*d* |
| — per bush., 1*s* 6*d* to 3*s* | Fennel, per bunch, 2*d* to 3*d* |
| Turnips, p. doz. bundl., 1*s* to 2*s* | Savory, per bunch, 2*d* to 3*d* |
| Cucumbers, each, 1*s* to 3*s* | Thyme, per bunch, 2*d* to 3*d* |
| Radishes, per doz., 1*s* to 1*s* 6*d* | Parsley, per doz. bun., 2*s* to 3*s* |
| Celery, p. bundle, 6*d* to 1*s* 6*d* | — Roots, p. bundl. 9*d* to 1*s* |
| Carrots, per doz., 2*s* to 5*s* | Marjoram, per bunch, 2*d* to 4*d* |
| Spinach, per sieve, 1*s* to 1*s* 6*d* | Mint, green, per bunch, 4*d* to 6*d* |
| Onions, p. bunch, 3*d* to 4*d* | Watercress, p. 12 bunch., 6*d* to 9*d* |
| — Spanish, p. doz., 1*s* 6*d* to 4*s* | Corn Salad, p. hf. sieve, 1*s* to 1*s* 6*d* |
| Leeks, per doz., 9*d* to 1*s* | |

#### HAY.—Per Load of 36 Trusses.

Smithfield, March 2

| | | | | | |
|---|---|---|---|---|---|

| Inferior ditto .. ... | 65 | 75 | Second cut ... ... | 65 | 75 |
| Rowen ... ... ... | 63 | 66 | Straw ... ... ... | 25 | 30 |
| New Hay ... ... | — | — | | J. Cooper. | |

The supply short and trade brisk.

Whitechapel, March 27

| | | | | | |
|---|---|---|---|---|---|
| Fine Old Hay ... | 72*s* to 78*s* | | New Clover ... ... | —*s* to —*s* | |
| Inferior ditto ... | 60 | 65 | Inferior ditto... ... | 65 | 70 |
| New Hay ... ... | — | — | Straw ... ... ... | 24 | 27 |
| Old Clover ... ... | 84 | 88 | | | |

COAL MARKET.—Friday, March 28.

Holywell, 14s.; Carr's Hartley, 14s. 6d.; Tanfield Moor, 13s. 9d.; Wallsend Haswell, 15s. 9d.; Wallsend Stewarts, 15s. 9d.; Wallsend Tees, 15s. 9d.—Ships at market, 99.

POTATOES.—Southwark, March 24.

The Committee report that the although the arrivals during the last week have been moderate, trade is so very heavy that there is no improvement in prices. The following are this day's quotations:—York Regents, per ton, 70s. to 90s.; Scotch do., 50s. to 70s; ditto Cups, 60s. to 70s.; Cambridgeshire and Lincolnshire Regents, 50s. to 70s.; French whites, 50s. to 60s.

SMITHFIELD, Monday, March 24.

The supply of Beasts is small; unwillingness on the part of buyers to give advanced rates causes a slow trade; however, 3s. 8d. is currently obtained for choice qualities. The number of Sheep is also again small; the demand is good, and prices are on the average better. In a few instances 4s 8d. is rather exceeded for choice Downs. Good Calves are not very plentiful, and are rather dearer. From Holland and Germany there are 385 Beasts, 1110 Sheep, and 61 Calves; from Norfolk and Suffolk, 2400 Beasts; and from Scotland, 220.

| Per st. of 8 lbs.—s | d | s | d | Per st. of 8 lbs.—s | d | s | d |
|---|---|---|---|---|---|---|---|
| Best Scots, Hereford, &c. | 3 | 6 to 3 | 8 | Best Long-wools | 4 | 0 to 4 | 4 |
| Best Short-horns | 3 | 4 — 3 | 6 | Ditto Shorn ... ... | | ... | |
| 2d quality Beasts | 2 | 8 — 3 | 2 | Ewes & 2d quality | 3 | 0 — 3 | 8 |
| Best Downs and Half-breds ... | 4 | 6 — 4 | 8 | Ditto Shorn ... ... | | ... | |
| Ditto Shorn ... ... | | | | Lambs ... ... | | ... | |
| | | | | Calves ... ... | 3 | 0 — 4 | 4 |
| | | | | Pigs ... ... | 2 | 8 — 3 | 8 |

Beasts, 3692; Sheep and Lambs, 18,270; Calves, 119; Pigs, 310.

Friday, March 28.

We have but a short supply of Beasts, but the demand is small, and consequently there is difficulty in maintaining Monday's rates. There are more Sheep, and trade is dull; on the average prices are lower. There are a few more Lambs and Shorn Sheep, but it is too early in the season to quote them. As a guide to those desirous to clip, Shorn Sheep may be stated at 6d. per 8 lbs. lower than those in the wool. There is no alteration in the Calf trade. From Germany and Holland we have 110 Sheep, and 119 Calves; from Scotland, 300 Beasts; and 85 milch cows from the home counties.

| Best Scots, Hereford, &c. | ... | 3 | 6 to 3 | 8 | Best Long-wools | 3 | 10 to 4 | 2 |
|---|---|---|---|---|---|---|---|---|
| Best Short-horns | | 3 | 4 — 3 | 6 | Ditto Shorn ... ... | | ... | |
| 2d quality Beasts | | 2 | 8 — 3 | 2 | Ewes & 2d quality | 3 | 0 — 3 | 6 |
| Best Downs and Half-breds | ... | 4 | 4 — 4 | 8 | Ditto Shorn ... ... | | ... | |
| Ditto Shorn ... ... | | | | | Lambs ... ... | | ... | |
| | | | | | Calves ... ... | 3 | 0 — 4 | 4 |
| | | | | | Pigs ... ... | 2 | 8 — 3 | 8 |

Beasts, 642; Sheep and Lambs, 3900; Calves, 226; Pigs, 320.

MARK LANE.

Monday, March 24.—The supply of Wheat from Essex this morning was small, and moderate from Kent; the condition of the whole generally very bad; nevertheless, all was disposed of early, at the extreme prices of last week. Foreign was in better demand, but a general disposition to enhance prices checked business.—Best malting Barley must be written 1s. per qr. higher, but in other descriptions, as well as Beans and Peas, there is no alteration of value.—The Oat trade is firm, and the turn dearer, but we cannot raise our quotations.—With the exception of some sales to arrive, Flour sells less freely than last week.

| Per Imperial Quarter. | s. | s. | | s. | s. |

Friday, March 28.—The supplies of grain, both English and foreign, this week are less than of late. The attendance at market on Wednesday and this morning was not large, and in the business transacted Monday's prices were fully supported.—Barley is in improved demaud, at our quotations.—In the value of Beans and Peas there is no alteration.—Oats are generally held for an enhancement, which is, in some instances, realised.—There is more disposition to purchase Flour, and a trifling advance is obtainable.

Liverpool, Tuesday, March 25.—The arrivals of grain, &c., this week have been small. At our market this day there was a fair demand for Wheat, at the increased prices of Friday, being full 2d. per bushel above the rates of this day week, on the general run of samples, and on Egyptian an advance of 3d. per bushel was paid. The market was bare of Oats, and an advance of ½d. to 1d. per bushel was realised. In Barley there was no change, and not much doing. Peas brought full prices. Egyptian Beans were in fair retail request, and 6d. per qr. dearer. Indian Corn was 6d. to 1s. per qr. dearer than on this day week; the best American yellow brought 31s. 6d. per qr. There was a fair demand for Oatmeal, at an advance of 3d. to 6d. per load upon the rates of this day week. American Flour was 6d. per barrel, and French 6d. to 1s. per sack dearer.——Friday, March 21.—The arrivals from Ireland and coastwise have been quite trifling. At this day's market there was a good attendance of the town and country trade, who showed more disposition to purchase than of late, and a fair business was done in Wheat, at an advance of 1d. to 2d. per 70 lbs. on the most marketable descriptions, such as American, Rhenish, and French. Flour was in good demand, at an advance of 6d. per barrel on American. Oats and Oatmeal were in moderate request, at full prices. The same remark applies to Barley, Beans, and Peas. Indian Corn was inquired for at Tuesday's prices, but a further advance of 6d. to 1s. per qr. being generally demanded, little business resulted.

SKIRVING'S IMPROVED TURNIP SEEDS.

WILLIAM SKIRVING begs to announce to his Friends and the Public, that he has fixed the price of his IMPROVED SWEDE, and also the PURPLE-TOP YELLOW BULLOCK, at 9d. per lb.

In consequence of W. S. having extended the growth, and having had a very abundant crop of the seed of his Improved Turnips, he is this season enabled to offer it at the above reduced price; and he is also induced to take this step, to prevent Agriculturists being imposed upon, by the sale of spurious seeds, offered at a low rate, under his name.

W. S. can, with perfect confidence, recommend these Turnips, as being the best now in cultivation, in every respect, whether for the greatest crop, the best quality, or for keeping, according to the time of sowing.

All other kinds of Turnips, Carrots, Mangolds, and Root Seeds in general, of the best quality, at very moderate prices.

To Agriculturists, and others, laying down land for permanent pasture, W. Skirving begs to offer his selection of the most useful Perennial Grass Seeds; the sorts selected from personal observation of the growth and habits of the different Grasses grown in his experimental Grounds, at Walton. On this system he has supplied, within a few years, Seeds for many thousand acres, which have given every satisfaction.

*Orders, stating quantity and quality of Land to be laid down, will be correctly executed, with a suitable mixture.*

A remittance, or reference, is requested from unknown correspondents.

Queen-square, Liverpool, March, 1851.

PRIZE MANGOLD WURZEL, SWEDE TURNIPS, &c.

JAMES GROVE, Great Baddow, Essex, who obtained Prizes at the Chelmsford and Essex Agricultural Show for nine years in succession, begs to state that his Seeds grown from selected roots, not plants, may be obtained of him, or of Messrs. Philip Hare and Co., 36, Mark-lane, London. He begs to call attention to the following opinions of the press: "The roots shown by Mr. Jas. Grove stand unrivalled."—Smithfield Club Show, 1848; *Mark Lane Express.* "The roots shown by Mr. J. Grove are allowed to be the best specimens ever shown, some measuring 36 inches in length and weighing 20 lbs."—Smithfield Club Show, 1849; *Ibid.* "The chief merits of these roots are their great length and growing not more than three inches in the ground, with very small tops."—Smithfield Club Show, 1848; *Bell's Weekly Messenger.* "The roots shown by Mr. James Grove were pronounced by many practical judges to be the most perfect specimens they had ever seen."—Smithfield Club Show, 1849; *Ibid.*

AGRICULTURAL SEEDS.

BASS & BROWN'S PRICED and DESCRIPTIVE AGRICULTURAL SEED LIST may be had free by post. The following of best quality delivered free to London, Ipswich, Norwich, or any station on the same line of Railway.

Same Side as Eastern Counties Railway.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS and CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. Weeks and Co., King's-road, Chelsea, London.

GREENHOUSE AND CONSERVATORY BUILDING ESTABLISHMENT, HOT-WATER APPARATUS MANUFACTORY, KENSALL-GREEN, HARROW-ROAD, LONDON.

JOHN TAYLOR begs most respectfully to call the attention of the Nobility, Gentry, and Gardeners, to the very superior manner in which he erects all kinds of Greenhouses, Conservatories, Forcing Pits, &c., and all other buildings for Horticultural purposes, combining all the most modern improvements with elegance and utility. His manner of heating Horticultural Buildings, Churches, Chapels, Public Buildings, Entrance Halls, &c., has received the greatest approbation from the Nobility and Gentry by whom he has been extensively engaged.

GREENHOUSES.

HENRY FREEMAN, Hothouse Builder and Hot Water Apparatus Manufacturer, Triangle, Hackney, London, begs to solicit the attention of the gentry to his low prices for cash. Good substantial-built Greenhouses, fixed complete, 42 feet long by 13 feet wide, 90*l.*; 21 feet long by 13 feet wide, 50*l.*; 12½ feet long by 10 feet wide, 30*l.* A large assortment of Conservatories, Hothouses, Pits, Melon and Cucumber Boxes, Iron Hand-lights, Summer-houses, Seats, &c. Estimates in the above line, either in wood or iron.

HORSE-KEEP, Oat-Bruisers, Chaff-Cutters, Ploughs, 42*s.*; Shares, 5*s.* a dozen; Rollers, Wheat Mills, Bean Mills, Steam Engines, Scarifiers, Turnip Cutters, Dressing Machines, Drills, Threshing Machines, Wood and Iron Harrows, Steaming Apparatus, Scotch Carts, Haymaking Machines, Horse Hay-Rakes, Drag Mills. First Class Goods warranted. Mary Wedlake and Co., 113, Fenchurch-street, London. Most liberal discount for cash. Goods delivered free.

PURVEYOR TO HER MAJESTY, AND THE KING OF THE NETHERLANDS.

JOHN BAILY, 113, Mount-street, Grosvenor-square, London, Dealer in all sorts of useful and ornamental Poultry, Wild and Tame Pheasants, Domesticated Wild Fowl, Fancy Fowls' eggs for setting. Baily's Registered Poultry and Pheasant Fountain, to ensure a constant supply of clean water for Gallinaceous Birds, especially adapted for Chickens, Pheasants, Poults, Pigeons, &c; by its use, many of the diseases to which these birds are subject are avoided, as, although there is an ample supply of water, they cannot get into it. 1*l.* quarts, 17*s.* 6*d.*; 7 quarts, 15*s.* 6*d.*; 3 quarts, 13*s.* 6*d.* Particulars, with a drawing, forwarded, per post, on application.

Apply to Timothy Mason, No. 5, Bear's Place, New North Road, Islington, two doors from the North Pole Tavern. A Cochin China Cock and two hens for sale, price 2*l.*; Malay and Spanish Fowls, Carrier and Almond Tumbler Pigeons, Gold Pheasant Cocks, &c., for sale. Letters requiring reply, to enclose stamp.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on WEDNESDAY, April 2d, a first-rate Collection of Carnations and Picotees, Pinks, and Auriculas, also Dahlias in dry roots, Gooseberries, Climbing and other Roses, &c. May be viewed the morning of Sale. Catalogues had at the Mart, and of the Auctioneer, American Nursery, Leytonstone, Essex.

CARNATIONS AND PICOTEES.

MESSRS. PROTHEROE AND MORRIS will Sell the Surplus Stock belonging to Mr. NEWHALL of Woolwich, by public Auction, at the Mart, Bartholomew-lane, on TUESDAY, April 8th.—Catalogues will be forwarded, on pre-paid application, and further particulars duly announced.

CASTLE ASHBY, NEAR NORTHAMPTON.

Very Extensive and Important Sale of SHORT-HORNED CATTLE, SUFFOLK and other HORSES, LEICESTER SHEEP, PIGS, &c.

MR. H. STRAFFORD has the honour to announce that he has received instructions from the Executors of the late Marquis of Northampton, to sell by Auction, without reserve, at Castle Ashby, on TUESDAY and WEDNESDAY, the 8th and 9th days of April next (the Farms being Let), the entire Herd of SHORT-HORNED CATTLE, consisting of about 160 head of Bulls, Cows, Heifers, and Steers; Flock of about 750 Sheep, part of which are pure-bred Leicesters, the remainder a cross with the Southdown; valuable Team of 10 Suffolk Cart Horses, two bright Bay Carriage ditto, light Brougham, Pony Chaise and Harness, with the superior stock of 25 Breeding Sows and other Pigs. The Short-horns are descended from the celebrated herds of Earl Spencer, Messrs. Barnett, Beasley, Beauford, Faulkner, Manning, Tibbits, &c.; amongst them are some very prime Steers, which are well adapted for exhibition. The Suffolk Horses are bred from the stock of the late Lord Huntingfield, and Mr. Crisp, of Gedgrave. The Leicester Sheep are from the well-known flocks of Messrs. Beasly, Chapel Brampton; Painter, Burley; Manning, of Orlingbury; W. D. Manning, Rothersthorpe. They combine good size and symmetry with first-rate quality of wool and mutton. The Pigs are white, and of a very superior description. The remainder of the valuable team of 15 cart-horses, with the whole of the Implements and Dead Stock, will be sold on THURSDAY, the 10th of April.—Catalogues, with the pedigrees of the Short-horns, may be had upon application to Mr. STRAFFORD, 3, Camden Villas, Camden-town, London; of Messrs. FREEMAN and SON, Market-square, Northampton; and of Mr. ROBINSON, of Castle Ashby.

RELIEF OF FAMINE IN THE HIGHLANDS.—We, the undersigned Directors of the Royal Patriotic and Industrial Society of Scotland, respectfully request the attention of the friends of the destitute Highlanders to the subjoined STATEMENT.

A very large portion of the Highland population, rendered destitute by the failure of the Potato in 1846, was supported from that period until September last, upon rations of one or one and a-half pounds of meal per day, in return for their whole labour upon roads and similar works. Since the exhaustion of the Highland Relief Fund, many thousand persons, living in remote Highland and Island districts, have been in absolute want of the necessaries of life, and are now reduced to the necessity of begging a subsistence,—of flying from starvation, where they possess the means of transit, or are tempted to the commission of theft in order to sustain life.

In many instances estates are in the hands of trustees, and in others, not only would the rental be inadequate to maintain the destitute able-bodied poor, but in some instances the proprietors have advanced very large sums for the sustenance of the people beyond the whole income derived from their estates since 1846. Emigration has been extensively resorted to, and may still afford a useful outlet, but it is now generally admitted that the most practicable means of administering relief, and of grappling with the destitution, which otherwise is likely to be permanent in the Highlands, is by carrying out the plans of rural industry developed and advocated by the Royal Patriotic and Industrial Society, and already in beneficial operation in several districts. The able-bodied though destitute poor, not being entitled to parochial relief in Scotland, the first and most imperative object is the sustaining of life, which the Directors will seek to effect if provided with the requisite funds.

Possessing an efficient but economically conducted executive, with gratuitous organizations in the Hebrides and other Highland districts, the Society is anxious to administer PRESENT AID, leading to permanent ameliorations, by carrying out its great principle of "helping the poor to help themselves."

The Directors will, therefore, as regards necessitous crofters in possession of land, endeavour to procure for such as will engage to follow a better system of husbandry, the cancelling of arrears of rent, an adequate tenure, and they will advance small loans to be paid as wages for the cultivation and improvement of their crofts; they will also extend similar encouragement to fishermen, and organise, for the benefits of the juvenile population, model school farms, for which land has been gratuitously offered to the Society by several proprietors.

As regards the immediate relief of those able-bodied, but destitute, persons, who possess neither crofts nor employment, the Society will, if duly supported, take certain quantities of waste land on lease, to be cultivated as Industrial Farms, particularly with a view to the raising of green crops, Tussac Grass, flax, or hemp, and by rearing dairy produce and poultry, render the now waste land and labour of the destitute Highland districts as productive as possible.*

The Directors refer to the publications of the Society for further details as regards the operations of the Institution, which may be obtained of the Secretary, 53, Parliament-street, London; and beg to state, that any contributions with which they may be intrusted will be applied, with all possible economy and efficiency, towards the immediate relief, and, at the same time, the permanent amelioration, of the famishing but loyal and peaceful population of various districts of the Islands and West Highlands.

Contributions are requested to be made to any of the Directors of the Society, to its account at the Union Bank of London, to Messrs. Forbes, Forbes, and Co., 9, King William-street; or at Messrs. Hatchard, Seeleys, or Nisbet and Co., London.

As much land has remained uncultivated ever since 1846 for want of seed to crop it, contributions of good sorts of Potatoes, Oats, Barley, garden and other seeds, will be thankfully received at the Society's depots, 53, Parliament-street, London; at the *Agricultural Journal* Office, 8, St. Andrew-street, Edinburgh; and at A. F. Cameron and Co.'s, 33, Virginia-street, Glasgow.

(Signed)

* Very gratifying reports of the industry of 60 families, recently located at Loch Elford side, in North Uist, by the Perthshire Ladies' Relief Association, have been received, and where the principles advocated by the Royal Patriotic Society have been longer in operation, three times the former amount of food has been raised by the crofters.

TO MARKET GARDENERS AND OTHERS.

TO BE LET, within 4 miles of London, and near a Railway Station, a COTTAGE, with Sheds, Piggeries, &c., a Greenhouse, and 3 Acres of Garden, part planted with Fruit Trees.—For particulars, apply to J. C., Mr. BIGGS, Cart and Horses, Stratford, Essex.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

TO BE LET, in the County of Mayo, Ireland, a FARM of 372 Acres, with a comfortable Residence, and extensive Stabling and Cattle Sheds; also, a good Garden, well enclosed. The House requires some repairs, and is in the centre of the Farm, four miles Irish from the port of Westport, and the same distance from the Assize town, Castlebar. A guarantee against excessive poors' rates will be given, if agreed upon.—Direct to M. S., care of G. HILDEBRAND, Esq., Westport, Ireland.

TO BE LET, in consequence of the death of the late proprietor, a Compact NURSERY, in the immediate vicinity of Bristol, with a Dwelling-house, Stable, and other Outbuildings thereon. The person taking to the Nursery may have the option to rent a SHOP, centrally and eligibly situate in Bristol, calculated for the carrying on of a good Seed business. The Nursery Stock, Hothouses, &c., to be taken at a valuation.—For particulars, apply to Mr. THOMAS DIX, Solicitor, Small-street, Bristol.

SPLENDID WORKS ON NATURAL HISTORY.

EDWARDS'S BOTANICAL REGISTER, consisting of Coloured Figures of Plants and Shrubs cultivated in British Gardens, with their History, Treatment, &c. NEW SERIES, Edited by Dr. LINDLEY, with 750 *beautiful coloured plates*, 10 large vols. royal 8vo, new cloth, 5*l.* 15s. (pub. at 22*l.*). 1838-47.

This is the new and complete series of this beautiful and esteemed work. As the number for sale is very limited, early application is desirable.

MEYER'S BRITISH BIRDS and their EGGS; 322 *beautiful coloured plates*, with Descriptions. 7 vols. 8vo, in 108 Parts (just published at 18*l.* 18s.), only 8*l.* 8s. 1841-50.

This beautiful publication is the most complete illustrated History of British Birds. The figures are all drawn from nature.

CUVIER'S ANIMAL KINGDOM, arranged according to its Organisation, being a description of Quadrupeds, Birds, Fishes, Insects, Shells, &c. By CUVIER and LATREILLE. Translated from the last French edition, with 4000 figures, mostly coloured, on 800 plates, 8 vols. 8vo, half morocco, 3*l.* 10s. (pub. at 8*l.* 8s.). 1837.

This is the most scientific and general work upon the subject, and the only one upon Natural History suitable for a "Home Library."

WOOD'S BRITISH ENTOMOLOGY, or Illustrated Catalogue of the Lepidopterous Insects of Great Britain, containing 1944 *figures, beautifully engraved and coloured of all the Butterflies and Moths*, with an Account of their Localities, &c. 8vo, cloth, 3*l.* 10s. (pub. at 8*l.* 8s.). 1845.

The most complete illustrated work on British Butterflies and Moths. The figures are executed with remarkable beauty and fidelity. Very few copies remain for sale.

G. WILLIS, GREAT PIAZZA, COVENT GARDEN.

"Pulman's *Fly fishing for Trout*, is a worthy companion to Sir H. Davy's *Salmonia*."—*Morning Post.*

"For sound practical knowledge, seasoned with real enthusiasm for the gentle art, we have no hesitation in recommending our author to the attention of the brothers of the angle."—*Sporting Magazine.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

MONTHLY STORY FOR YOUNG PEOPLE. By the Editors of the "Family Economist."

STORIES FOR SUMMER DAYS AND WINTER NIGHTS.

These well-written and beautiful stories will be found more acceptable in many respects for the monthly reading of the young than any Magazine, and equally interesting to readers of older growth. They are lively, instructive, and moral; adapted to entertain and improve—to inform the mind and educate the heart. Each story is illustrated with well-executed engravings. They are among the best and cheapest books for young people published. Already published—I. The Sea Kings. II. Madeline Tube, and her Blind Brother. III. The Young Emigrants. IV. The Boy and the Book. The above are now ready, in one volume, elegant binding, price 1s.; or separately, 3*d.* each. OSCAR, a tale of Norway, will be published 1st of April. London: GROOMBRIDGE and SONS, Paternoster-row, and sold by all Booksellers.

"He that tilleth his land shall have plenty of bread."

Just published, price 4*d.* each.

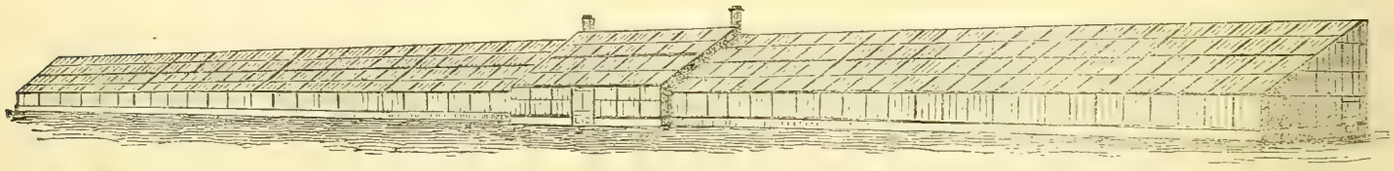
# READ'S PATENT GARDEN ENGINES, MACHINES, AND SYRINGES.

R. READ begs to inform Ladies, Amateur and Practical Gardeners, and the Public generally, that he has made considerable improvements in his ENGINES MACHINES, and SYRINGES, by which Water may be dispersed in various densities, from a POWERFUL STREAM to a gentle Shower or Dewfall, and may be applied on the choicest Fruit Trees, Vines, Pines, &c., &c., without the slightest danger of injury. An improved ANGLE BRANCH may be applied to the Syringe for cleansing the UNDER surface of the leaves of Plants, &c., &c. Manufactured only by

RICHARD READ,

INSTRUMENT MAKER (BY SPECIAL APPOINTMENT) TO HER MAJESTY,



35, REGENT CIRCUS, PICCADILLY, LONDON.

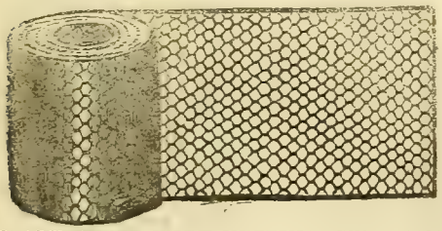
*** CAUTION.—As Instruments of the commonest description are extensively circulated throughout the Kingdom, and sold *as Read's*, please observe that none are genuine except stamped with the Royal Arms and "READ'S PATENT."

BY HER MAJESTY'S ROYAL LETTERS PATENT.

# PATENT HOTHOUSE WORKS, KING'S-ROAD, CHELSEA.

## E. DENCH, PATENTEE.

This Range, consisting of Nine Houses, varying from 24 feet to 30 feet long, by 16 feet to 19 feet wide, each, which are all heated by Hot-water, being half the number erected for EDWARD L. BETTS, Esq., Preston Hall, Aylesford, near Maidstone, Kent.



Mr. Thomas Frost, the Head Gardener, has proved the superiority of these Houses for the growth of both Fruits and Plants, and will give every information.

THE PATENT consists of two distinct principles for all Horticultural Erections—on one plan the Roof is formed wholly of Iron and Glass, no wood or putty, &c., and not more than three-quarters of an inch of light being taken up anywhere, and is very light, strong, and elegant, free from drip, and perfectly impossible for the rain to penetrate; the other principle consists of the Roof being formed in Sashes, and the surface of the Roof being Iron, Glass, and Putty, and, the work being hollow, is perfectly free from contraction or expansion. These Houses have been proved in all parts, and are found to excel all others. Heating by Hot-water on most scientific principles.

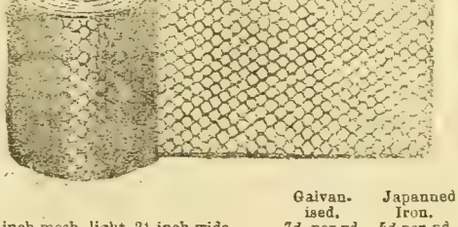
ONE GOOD SECOND-HAND HOUSE FOR SALE.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25*l.* per ton, and Rich Purple-brown, 20*l.* per ton.—Offices of the Company, 1, New Broad-street, London.—JOHN A. WEST, Secretary.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | |
|---|---|---|---|
| 12 inches wide | 3*d.* per yard. | 30 inches wide | 7½*d.* per yard. |
| 18 " " | 4½*d.* " | 36 " " | 9*d.* " |
| 14 " " | 6*d.* " | 48 " " | 1*s.* " |



Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each, Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

THE HIPPOPOTAMUS, presented to the ZOOLOGICAL SOCIETY by H.H. the Viceroy of Egypt, is Exhibited daily at their Gardens, in the Regent's Park, from 11 to 4 o'clock. Visitors desirous of seeing the Animal in the water are recommended to go early.

Admission, One Shilling; on Mondays, Sixpence.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24-inch wide ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch " strong " ... | 9 " | 6½ " |
| 2-inch " extra strong " ... | 12 " | 9 " |
| ¾-inch " light " ... | 8 " | 6 " |
| 1½-inch " strong " ... | 10 " | 8 " |
| 1½-inch " extra strong " ... | 14 " | 11 " |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

IRON GATES, HURDLES, &c.

THOMAS PERRY AND SONS, 352, OXFORD-STREET (NEAR HYDE-PARK), And Highfields Wrought and Cast-iron Works, Bilston Staffordshire, Manufacturers of every description of Park Entrance, Carriage and Field Gates, Wickets, &c.; Plain and Ornamental Fencing and Palisading; Ox, Cattle, Sheep, and other Hurdles; Tree Guards, Garden Seats, Hay Racks, Wheelbarrows; Land and Garden Rollers, Stable Fittings, &c. &c.

The works being situated in the centre of the Staffordshire Iron district, THOMAS PERRY AND SONS are enabled to execute promptly orders to any extent with the greatest facility, of the best quality, and most moderate terms. A great variety of the above articles always kept in Stock at the London Warehouse, and at the Works. Drawings and prices may be obtained on application, or furnished free by post.

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

LINGHAM BROTHERS, 170, Hampton-street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MENOGRAPH, or Label for Garden Borders, Flowerpots, &c., in boxes of 100, &c. The Zinc Labels are highly approved of for their lasting durability; can be written upon with the greatest ease, and, when dry, a permanent inscription is secured. Directions for use sent with each box, including bottle of Metallic Ink.

Sole Agents in London, G. and J. DEANE, Horticultural Implement Warehouse, 46, King William-street, London Bridge.

METCALFE AND Co's NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co's, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their Office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said County, wher all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, MARCH 29, 1851.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY. Under the Patronage of Her Most Gracious Majesty the QUEEN The First EXHIBITION for the season will take place on WEDNESDAY, APRIL 23, in the Assembly Rooms, at the HORNS TAVERN, KENNINGTON, open to all Exhibitors, when Prizes will be awarded for the following productions, viz., Miscellaneous Plants, Auriculas, Heartsease, Polyanthuses, Cinerarias, Specimen Plants, and Seedlings. Mr. Oakey's Band is engaged for the occasion. Admission to Members and their Friends at 12 o'clock, and to the public from 1 to 6 o'clock, at One Shilling each. The following Exhibitions will also take place at the Royal Surrey Zoological Gardens: On Wednesday, May 21; Wednesday, June 25; Thursday, July 24; and Wednesday, Sept. 3.

Lists of Prizes and the Rules of the Society may be obtained of JOHN TAYLOR NEVILLE, Secretary.

Ebenezer House, Peckham, Surrey.

PELARGONIUMS AND NEW PLANTS.

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST to HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to inform the Nobility, Gentry, and Amateurs, that his Spring CATALOGUE of PELARGONIUMS and NEW PLANTS is ready, and will be forwarded by post on application.

NEW DAHLIAS; E. FOSTER'S, ESQ., CHOICE PELARGONIUMS; PICOTEES, CARNATIONS, HOLLYHOCKS, PANSIES, &c.

WILLIAM BRAGG, Star Nursery, Slough, begs to say his Catalogue of the above Flowers is now ready, and can be had on application. His choice SEEDLING DAHLIAS will be sent out the first week in May at 10*s.* 6*d.* each, viz:—

ADMIRAL, rich lilac, very constant, gained first Seedling prize, 25*s.*, at the Royal South London Exhibition; 21*s.* Shacklewell Open Shows, &c, fourteen first class certificates; the most successful flower of the year.

CARMINA, rich carmine, constant show flower, gained six first class certificates, &c., shown in several winning stands.

The Hon. Mrs. ASHLEY, waxy white, tipped with rose, splendid show flower, &c. W. B. thinks it the best Dahlia of the season; was awarded by Dr. LINDLEY a certificate of merit at the Horticultural Society, &c. Gained five first class certificates.

QUEEN OF FAIRIES, Domeyer. W. BRAGG has purchased the stock of this fine and constant fancy Dahlia, from the above amateur, who will give 5*l.* in prizes the next season for this flower. It gained a Seedling prize and first class certificate, with Edwards's Mrs. HANSARD; at the Royal South London Open Show Exhibition five first class certificates.

W. B.'s stock of Picotees, Carnations, and Pinks are strong and good; the best Hollyhock Seed ever sent out can be had in 2*s.* 6*d* and 5*s.* packets, post paid, for prepayment.

MESSRS. HAY, SANGSTER, AND CO. will be ready to supply their prepared POTATO CUTTINGS about the middle of April next, the produce of which proved so highly satisfactory last, as well as the experimental trials of the three former years, as to QUALITY, QUANTITY, and SIZE, being more than double the crop this year of those planted in the usual way, and containing a much larger quantity of starch, which is so essentially necessary to the preservation of that valuable root. A report of the analysis will be found below. Our own experiments give about one-third more saccharine matter than the best we could procure grown under the old system. All orders must be to hand on or before the end of the second week in April, as H. S. and Co. are preparing to plant a large breadth, and will only provide for what may be ordered up to that time. Post-office orders to be made payable to JOHN SANGSTER, at the Borough Post-office, Southwark. Printed instructions for planting and management will be sent with the plants ordered.

| | Per 1000—*s. d.* | | Per 1000—*s. d.* |

Package and delivering to any Carriers' Office in London, 1000 to 5000, 1*s.*—Newington Butts, London, March 22.

*** We have examined a sample of Potatoes, called York Regents, grown by Messrs. HAY, SANGSTER, and Co., in comparison with two other samples of Potatoes of the same denomination, obtained by ourselves from a highly respectable Potato Salesman, with a view to ascertain the amount of starch contained in each, with the following results—viz.,

| | Starch. |
|---|---|
| Messrs. HAY, SANGSTER, and Co.'s York Regents | 15½ per cent. |
| Salesman, No. 1 | 11¾ " |
| " No. 2 | 9¼ " |

MAURICE SCANLAN, F.C.S., Chemical Works, George-street, Bermondsey; ALFRED ANDERSON, F.C.S., Experimental Chemist, Great Suffolk-street, Southwark.

BECK'S SEEDLING PELARGONIUMS AND THE BEST OF OTHER RAISERS' VARIETIES. Fine plants, ready for shifting into large pots; twelve for two guineas, including carriage to London and the packing-case. This is the proper time for purchasers to procure them. Catalogues may be had on application to J. DOBSON, Wortoncottage, Isleworth, Middlesex. The stock was never finer, and purchasers may rely on the best selection being made for them, if they cannot choose for themselves.

J. FOWLE AND SON have now ready their descriptive Catalogue of Geraniums, Fuchsias, Verbenas, Antirrhinums, Phloxes, Herbaceous and Bedding Plants in general. Dielytra spectabilis, from 18*s.* to 36*s* per doz.; 12 extra first-rate Fuchsias, 18*s*; 12 ditto ditto, 12*s*; 12 extra Antirrhinums, 12*s.*; 12 good border varieties, 9*s.* Holland Nursery, Hollandstreet, Brixton Road, Kennington, Surrey.—April 5

RHODODENDRON JAVANICUM, or new Orange-coloured RHODODENDRON, from JAVA, now in flower at W. ROLLISSON AND SONS' Nursery, Tooting, Surrey.

WILLIAM ROLLISSON and SONS beg most respectfully to inform the Nobility, Gentry, and Public that they have now in flower at their Nursery, the new and beautiful RHODODENDRON JAVANICUM. The plants in flower are Seedlings, raised only three years ago, a proof that it is a remarkably free flowering species.—Fine plants from 10*s.* 6*d.* and upwards.

NEW SEEDLING CALCEOLARIAS.

N. GAINES begs to inform Amateurs, Nurserymen, and others, that he is sending out KINGHORN'S New Seedling CALCEOLARIAS, also those raised by himself. He will have strong Plants of his new Dwarf Seedling DAHLIAS "Prince Arthur" and "Rachel," to send out the first week in May. A descriptive list of Fancy Pelargoniums and Show varieties; also Fuchsias, Verbenas, Cinerarias, &c., can be had by applying at the Nursery, Surrey-lane, Battersea, near London.

MESSRS. J. AND H. BROWN offers to the Nobility and Gentry the following CHOICE PLANTS, &c.:

| 12 Pæonies, new white, pink, and blush, of sorts | 8 0 |
| 6 fine Pæonia Arborea, choice varieties for | 10 0 |
| Verbenas and Petunias, best new sorts, per dozen | 6 0 |
| Best Cinerarias and Calceolarias, strong plants, 9*s.* per dozen to | 12 0 |
| 25 choice Hardy Herbaceous Plants, named | 7 6 |
| New Camellia seed, just imported, sent post free, 50 for | 5 0 |
| Flower Seeds, 18 papers, 5*s.*; 36 ditto, 10*s.*, of the most approved varieties, also their Catalogue of Plants, sent free by post. | |

Albion Nursery, Stoke Newington, London, April 5.

HOLLYHOCK SEED.

EDWARD TILEY begs to inform the lovers of that beautiful flower that he has been successful in procuring a quantity of good sound SEED of the above from an Amateur Gentleman who has one of the most superb and choice collections in cultivation; the seed having been selected with every care and attention, he can confidently recommend it. Sold at 2*s.* 6*d.* per packet, containing 150 seeds, or 5*s.* for a packet of 400 seeds.

GERMAN ASTER SEED.

Unequalled for the superiority of flower, the shape of which forms that of half a globe, and has been admired by thousands of spectators at numberless exhibitions. There are from 20 to 30 varieties, 1*s.* per packet.

SWEET-WILLIAM SEED.

Saved from 24 superb varieties. The flowers are very large, and of dwarf habit. They were much admired when in bloom, by countless spectators, and the Seed numerously ordered by them; 1*s.* per packet.

ANTIRRHINUM SEED.

E. T. being a most extensive grower of all the choicest sorts known in cultivation, has selected the Seed with great care from the finest varieties, as to colour, shape and habit of plant. There are more than 50 distinct varieties; 1*s.* per packet.

DWARF ORANGE AFRICAN MARIGOLD SEED.

Unrivalled for its superior size and darkness of colour, many of the flowers last season measuring 5 inches over, and not more than 1 foot high; 6*d.* per packet.

Or, if preferred, a 5*s.* packet of Hollyhock and a packet of each of the above varieties for 7*s.*

| | |
|---|---|
| Walcheren Cauliflower Broccoli (as imported) | 1*s.* 0*d.* p. packet. |
| Tamworth Broccoli | 1 0 " |
| Wilcove Broccoli | 1 0 " |
| Cole's Superb Solid Celery | 0 6 " |
| Bath Cos Lettuce, seed true, the best and finest flavoured in cultivation | 1 0 " |

A remittance must accompany the order, either in cash or penny postage stamps for the amount.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath.

FIFTY-FOLD KIDNEY POTATO.

JAMES LAKE, NURSERYMAN, &c., Bridgewater, Somerset, begs to inform the public that he is now sending out his Seedling Fifty-fold Kidney Potato, six tubers of which were sent to Dr. Lindley, April 29th, 1850, and produced 312, quality very good; six tubers also sent to Beck, Henderson, and Co., at the same time, produced 580, although grown in poor ground. Price 4*s.* per peck.—London Agents: HURST and M'MULLEN, 6, Leadenhall-street.

J. L. having grown from 15 to 20 lights of Aban's Conqueror of the West CUCUMBER, successfully for three years, can with confidence recommend it to the public as being one of the best kinds in cultivation. Packets containing 12 seeds, 1*s* each.

PRICED CATALOGUES OF

LOUIS VAN HOUTTE, NURSERYMAN, Ghent, (*Belgium*), to be had of Mr. GEO. RAHN, 52, Mark-lane, London.

*** The usual discount to the trade.

DECIDED BARGAINS. — Dahlias, fine show varieties, 6*s.*; Carnations, competing flowers, 6*s.*; Ditto without names, fine, 4*s.*; Alonsoa grandiflora, 3*s.*; Heliotropes, of sorts, 4*s.*; Fuchsias from 1 to 2½ feet, 6*s.*; Ditto, other named sorts, 6*s.* to 9*s.*; Petunias, named varieties, 4*s.*; Ditto, without names, 2*s.*; Pinks, competing flowers, 4*s.*; Ditto, seedlings from named sorts, 3*s.*; Pansies, show varieties, 6*s.* to 12*s.*; Calceolarias, seedlings—fine, 4*s.*; Phlox Drummondii 3*s.*; Verbenas, named, 4*s.*; Ditto, seedlings, 2*s.*

The above are the prices per dozen. Plants sent to compensate for long carriages. General Catalogues forwarded on application to WM. ANDERSON.—Dundee, April 5.

GIANT SAINTFOIN.—After three years' trial of this article, in various soils and in competition with the common Saintfoin, Messrs. SUTTON can recommend it with increasing confidence for general cultivation It will thrive on almost every kind of soil, and has succeeded in several instances where the common Saintfoin had failed. Its produce is much greater, the first crop is ready several weeks earlier than the old sort, and one or two good cuttings may be had during the summer and autumn.

*In* Messrs. SUTTON's *sample ground, a plot of the* GIANT SAINTFOIN, *sown in March*, 1849, *has had five good crops cut from it, and is now very strong again. Present price of Seed*, 10*s. per bushel, or* 7*2s. per quarter.*

Mangold Wurzel, 6*d.* per lb.; White Belgian Carrot, 9*d.* do.; Skirving's Liverpool Swede, 8*d.* do.; Ashcroft Swede, 9*d.* do., and all other Agricultural Seeds of Home Growth, sent carriage free by rail to London, Bristol, Southampton, &c.

Reading, Berks, April 5.

NEW DAHLIAS.

CHARLES TURNER will be prepared to execute orders on the 1st of May for the following varieties, which are very superior flowers, and should be in every collection grown for exhibition:—

| | |
|---|---|
| BARMAID (HOLMES) white, occasionally tinged, but generally a fine white of unusual substance | 10 6 |
| JULIEN (HALE) rosy purple, neatly cupped, of great depth; took certificates at Slough and Notting Hill | 10 6 |
| NAPOLEON (PARKER) rich vermilion, of a novel and striking shade, flower deep and symmetrical, constant and good habit; certificate at Wycombe | 10 6 |
| NEPAULESE PRINCE (STEIN) crimson, shaded with dark maroon, very superior constant show flower, being an improvement on Richard Cobden; has obtained numerous first prizes in class showing and six first-class certificates | 10 6 |
| NIL DESPERANDUM (STEIN) vivid scarlet, unquestionably the best of its class, the petal good, flower of great depth, and finely developed, one of the leading flowers of the season; has been very successful | 10 6 |
| REGINA (HALE) shaded rose, smooth good petal, well formed, good size; took certificate at Royal South London | 10 6 |
| ROUNDHEAD (HOLMES) salmon buff, deep, full, finely formed flower, good grower, at all times to be depended on; habit particularly good; took certificates at Metropolitan, Royal South London, and Norwich | 10 6 |
| SIR CHARLES NAPIER (HALE) rich scarlet, fine firm flower, finely formed and closely set, handsome close centre; took certificate at Highgate | 10 6 |

FANCY DAHLIA.

MRS. HANSARD (UNION) raised by J. Edwards, Esq.; yellow, with distinct white tips, fine form, and full size; very true and constant in every respect; a noble addition to this class; has been eminently successful at 12 of the principal shows | 10 6

CHOICE NEW FUCHSIAS,

which will be ready with the Dahlias.

| | |
|---|---|
| AJAX (HOCKEN) large dark, fine habit | 5 0 |
| BRILLIANT (BANKS) crimson, purple corolla, good habit, and very free bloomer | 5 0 |

N.B.—Turnip and all other Agricultural Seeds at the most reasonable prices.

---

GRASS SEEDS.

FINEST LAWN GRASS SEEDS, perfectly free from Weeds and coarse Grasses, 21s. per bushel, 3s. per gallon, or 1s. 3d. per pound, with instructions

To insure a pure Turf of finest Dwarf Grasses, Messrs. SUTTON strongly recommend the sowing the above Seeds, whereby the great expense of cutting, carting, and laying Turves may be avoided.

PERMANENT PASTURE GRASSES,

*Mixed expressly to suit the soil for which they are required, at the reduced prices of 22s. 6d. to 28s. per acre, viz.:*

| | |
|---|---|
| BEST MIXTURES for laying down Land to permanent Meadow or Upland Pasture, per acre ... | £ s. d. 1 8 0 |
| DITTO, for laying down Reclaimed Marshes and Common Inclosures, per acre ... ... ... ... ... | 1 2 6 |
| DITTO, for fine Park Lands near Mansions, per acre | 1 15 |
| DITTO, for Irrigation or Water Meadow, per acre ... | 1 6 0 |

SUTTON'S RENOVATING MIXTURE, consisting of Perennial Clovers and fine Grasses, for improving old Parks, Meadows, and Upland Pastures.

JOHN SUTTON and SONS *having reduced the price of these Seeds 25 per cent., viz., to 10d. per lb., or 1s. 6d. per gallon, great improvement in Pastures, &c., may be effected at a small cost, by the application of 6 or 8 lbs. per acre, sown immediately upon the old Turf.*

We are almost daily receiving unsolicited the most gratifying letters from our customers, in praise of our Seeds; and though we refrain from *publishing names* unnecessarily, we have much satisfaction in quoting the following:—

*From a Member of the Council of the Royal Agricultural Society.*

"Messrs. SUTTON,—I was particularly pleased with your Grass Seed, which I employed by itself, for laying down some fresh broken-up Land. It became a close fine sward by August. I have now about 30 acres of land to sow immediately, &c., &c., and shall be glad of your advice for the purpose."

*From the Land Steward at a large Estate in Hampshire.*

"All the kinds of Grasses sown separately grew admirably; and the 20 acres of Park laid down with *your Mixture* last spring is most excellent. We are anticipating a large crop of Hay, and I can see by the various habits and successional growths of the several kinds, that we shall always have a fresh growing bite for the cattle after the Hay is cut. The Clovers too I see are plentiful."

*From a Clergyman, an eminent Agriculturist and Member of the Royal Agricultural Society.*

"I have had the pleasure of praising your Seeds in many quarters beside that to which you refer. This I have done from a sense of justice only."

Another Clergyman writes us—"My Turnip crops are the admiration of all the farmers round, especially the Swedes and your Purple-topped Hybrid. I hope you have some of the same kind this year, as I am certain the superiority in my crops is mainly owing to the stocks."

*The above are similar to hundreds of others.*

N.B.—Instructions for Sowing accompany every parcel of Grass Seeds; and any other information required by post will be promptly given.

*Goods delivered free of carriage to any Office in London, Bristol, Gloucester, Exeter, Southampton, &c.*

**Reading, Berks, April 5.**

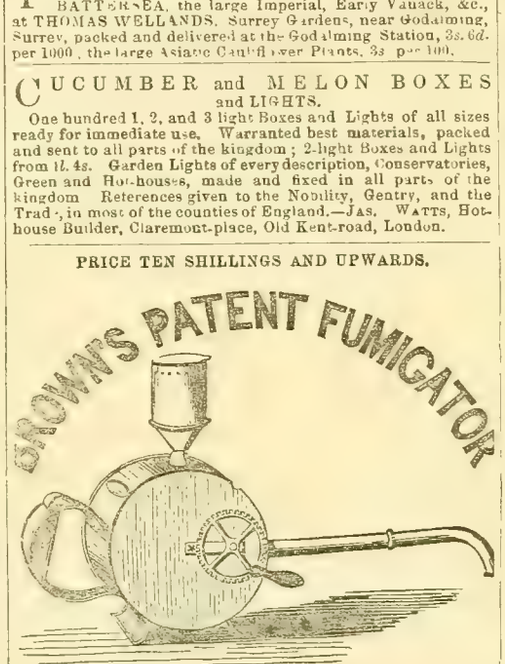
---

RIVERS'S STUBBLE SWEDE TURNIP SEED.

J. RIVERS solicits the attention of Agriculturists to his quick-growing SWEDE TURNIP. The variety owes its origin to a cross between a large variety of the Early Stone, in 1842, and the old Green Top Swede. It has become a distinct variety, by carefully selecting, for seven years, those most like the Swede in habit, so that now it is a true Swede, with the earliness of the White Stone; it is green-topped, with a short neck, with the solid yellow flesh of the common Swede; for sowing in May, for early feed, or for late sowing upon heavy land and sheep-fed leys, it will be found a valuable Turnip for hardiness and keeping qualities; also for sowing near large towns, to draw off early. It grew 11 tons per acre after Tares, mowed, without manure, on the 6th of August, 1849. Specimens of the roots were exhibited at the Baker-street Cattle Show; also specimen roots of different times of sowing, from May till August, were exhibited. Orders for any quantity above 10 lbs will promptly be attended to, if addressed to JOHN RIVERS, Seedsman, Sawbridgeworth, Herts, at 2s per lb, carriage paid to London. It will be sold in sealed bags, of 2½ lbs., price 5s.; and 5 lbs., 10s., by his agents, a list of whom will be found in the *Gardeners' Chronicle* of 22d March. Messrs. Sutton and Sons, Seedsmen, of Reading, who proved this Turnip with others in their sample ground last summer, state as follows:—"Seed sown on June 30th, July 20th, and August 10th, using the same manure for all, gave the following results—from the first sowing, the roots were fully equal to the *best* of the other sorts; from the second and third sowing, they were far superior in size, weight, and shape, thus showing its peculiar adaptation for late sowing."

---

TRUE DRUMHEADS for CATTLE, also EARLY BATTERSEA, the large Imperial, Early Vanack, &c., at THOMAS WELLANDS, Surrey Gardens, near Godalming, Surrey, packed and delivered at the Godalming Station, 3s. 6d. per 1000, the large Asiatic Cauliflower Plants, 3s per 100.



---

WARRANTED UNEQUALLED.

ROBERT WHIBLEY is now supplying Selections in Pots, and by Post, from his select Collection of FUCHSIAS. Twelve Varieties, new and distinct of last year, 10*s.* 6*d.* cash. See List containing a great variety of choice new Plants for one stamp.—Nursery, Kennington, London.

NEW SPRING CATALOGUE.
WOODLANDS NURSERY, MARESFIELD, near UCKFIELD, SUSSEX.

WM. WOOD AND SON have now published a New CATALOGUE OF GREENHOUSE AND BEDDING PLANTS, copies of which will be forwarded free on application.

W. W. and SON beg to offer strong plants from their superb collection of Hollyhocks, at 6*s.*, 9*s.*, and 12*s.* per dozen; Cape Heaths, 9*s*, 12*s.*, and 18*s* per dozen, strong and bushy; Chinese Azaleas, 9*s.*, 12*s.*, and 18*s.* per dozen, strong and bushy.

Chrysanthemums, best Continental vars, 6*s*, 9*s.*, 12*s.*; Phloxes, 6*s.*, 9*s.*, 12*s.*

Extra plants will be presented with each order, as compensation for carriage.

T. JACKSON and SON have still on hand a limited quantity of their Improved KIDNEY POTATO, at 7*s.* 6*d.* per bushel, and Golden Dwarfs at 5*s.* 6*d.* (an excellent Early Frame Potato); for the particulars of their merits, see *Gardeners' Chronicle* of the 14th or 21st December.

T. J. and SON, having the largest stock in the country of Taxodium sempervirens, are enabled to offer them at the following low rates:—Fine plants, 2 feet high, 2*s.* 6*d.*; 6 feet, 21*s.*; intermediate sizes at proportionately low prices. Forsythia viridissima, 3 feet high, full of flower-buds, 2*s.* 6*d.*; and all other general Nursery Stock at equally low prices.

Nursery, Kingston, Surrey, April 5.

GOLIATH STRAWBERRY.

JAMES KITLEY can supply good Plants of his celebrated Strawberry GOLIATH, at the very low price of 7*s.* 6*d.* per 100, or 12 Plants, free by post, for 18 postage stamps. Also fine Plants of Dwarf German HOLLYHOCKS mixed, at 12*s.* per dozen; these have all bloomed, and are very double and beautiful. HOLLYHOCK SEED, saved from a fine collection of double varieties, 18 packets, named, free by post, for 5*s.*; ditto mixed, per packet, 2*s* 6*d.* SWEET WILLIAM SEED, from a great variety of beautiful brilliant colours, per packet, 1*s.*

Lyncombe Vale Nursery, Bath, April 5.

CAMELLIA STOCKS FIT FOR IMMEDIATE WORK.

RENE LANGELIER, Clarendon Nursery, St. Helier, Jersey, begs to inform the Public that he has a very extensive stock of the above, fit for immediate grafting, very clean and healthy, well rooted, so as to leave without the pot, consequently much less expense in conveying to any distant place. Price 36*s.*, 40*s.*, and 50*s.* per 100.

The Stock is such as has never before been offered to the Public by any grower.

R. L. has a most extensive collection of Double Camellias at a very moderate rate and reduced price, as will be seen by a Catalogue recently published, in which it is proved that they can stand the climate out-of-doors without protection. The Catalogue can be had of R. L. by inclosing four penny stamps. Remittance or reference from unknown correspondents

THE FLOWER OF THE DAY—VARIEGATED SCARLET GERANIUM.—This elegant plant is of vigorous habit, the foliage bright green, with a broad silver margin. The flowers light scarlet, in large trusses, like Globe Compactum. JOHN and CHARLES LEE are selling extra strong plants, at 10*s.* 6*d.* each. Small plants for bedding on the 1st of June, 6*0s.* per dozen.—Nursery and Seed Establishment, Hammersmith, near London.

MESSRS. STANDISH AND NOBLE have to offer the following very desirable plants:

AZALEA INDICA, "GLORY OF SUNNING-HILL."—In general appearance this plant, when in bloom, reminds one of Nerium splendens, producing large double rose-like flowers of the richest pink; good plants, 3*s.* 6*d.* to 10*s.* 6*d.* each.

CRYPTOMERIA JAPONICA SEEDLINGS.

2 years ... ... ... ... 18*s.* per doz., or 105*s.* per 100.
3 years ... ... ... ... 30*s.* ,, 210*s.* ,,
1 foot 6 inches to 2 feet 6 inches high, 60*s.* per dozen.
2 feet 6 inches to 3 feet 6 inches high, 90*s.* ,,
3 feet 6 inches to 4 feet 6 inches high, 126*s.* ,,
And larger plants in proportion.

The whole of the above, with the exception of the two years seedlings, were planted into the open border last spring, are fine robust specimens, and fit for immediate planting.

CRYPTOMERIA JAPONICA, var. NANA, a very singular dwarf variety, 10*s.* 6*d.* to 21*s.*

CUPRESSUS FUNEBRIS, or WEEPING CYPRESS (North of China.)

6 inches high, 10*s.* 6*d.* each; 12 to 15 inches, 21*s.* each.

These plants are from the open border—robust specimens fit for immediate planting.

15 ins. to 24 ins., 31*s.* 6*d.* each; 24 ins. to 30 ins., 42*s.* each.

CUPRESSUS GOVENIANA. (California.)

6 to 9 inches, 7*s.* 6*d.* each; 9 to 15 inches, 10*s.* 6*d.* each.
15 to 24 inches, 21*s.* each; 2 to 3 feet, 31*s.* 6*d.*

CUPRESSUS LAMBERTIANA, 2 feet, 3*s.* 6*d.* each.

CUPRESSUS THURIFERA, var. ELEGANS, perfectly hardy. 1 foot to 2 feet high, 3*s.* 6*d.* to 5*s.* each.

CEPHALOTAXUS FORTUNII, strong plants, 31*s.* 6*d.* each. For description, see "Botanical Magazine," by Sir W. Hooker.

FORSYTHIA VIRIDISSIMA.

1 foot 6 inches to 2 feet ... ... 1*s.* 6*d.* to 2*s.* 0*d.* each.
2 feet to 3 feet ... ... ... ,, 2*s.* 6*d.* ,,
3 feet to 4 feet ... ... ... 3*s.* 6*d.* ,, 5*s.* 0*d.* ,,

Fine bushy plants from open border fit for immediate planting.

JASMINUM NUDIFLORUM ... ... 1*s.* 0*d.* each.
Flowering plants ... ... ... ... 3*s.* 6*d.* ,,

This is a very desirable winter flowering hardy plant, producing a profusion of flowers of the richest yellow from December to February.

QUERCUS SCLEROPHYLLA. (North of China.) This is undoubtedly the most remarkable of all evergreen Oaks, having foliage as large as the Spanish Chestnut, and more than twice the substance. Strong seedling plants, 42*s.* each.

QUERCUS INVERSA. (North of China) Also evergreen, with smooth entire leaves, having remarkably large male inflorescence. Seedlings, 42*s.*

FORTUNE'S YELLOW ROSE, a distinct species, admired by all who have seen it. It would be impossible to describe the combination or richness of the bronze and yellow tints which the flowers present. It is an excellent pillar Rose, and its foliage is distinct. It blooms freely, and in general habit resembles Rugs. Dwarfs, 5*s.*; Standards 10*s.* 6*d.* each.

TAXODIUM SEMPERVIRENS.

1 foot to 1 foot 6 inches ... ... 2*s.* to 2*s.* 6*d.* each.
1 foot 6 inches to 2 feet 6 inches ... 3*s.* 6*d.* to 5*s.*
3 to 4 feet ... ... ... ... 7*s.* 6*d.* to 10*s.* 6*d.* ,,
Larger in proportion.

Bagshot Nurseries, April 5.

AZALEA INDICA "SYMMETRY" (KINGHORN.)—The celebrity this Flower has gained, and the eulogium that has been bestowed upon it, render it only necessary to mention the opinions of competent judges, the awards it has received, and simply to add that it is superior in shape and substance to any variety hitherto introduced, and equal in colour and habit to the most popular kinds. In May, 1850, a first class certificate was awarded to it by the London Floricultural Society, and it was thus described in the *Gardeners' and Farmers' Journal*. "Azalea indica Symmetry is a magnificently formed flower, of extraordinary substance; colour salmonish pink, varying to light scarlet, richly spotted in the throat with deep crimson; size large." At the June show, 1850, at Chiswick, it obtained the Silver Banksian Medal, and was recorded in the *Gardeners' Chronicle* as "a considerable improvement on Lateritia." JOHN and CHARLES LEE having purchased the stock of Symmetry, intend sending out healthy Plants on the 1st of June, price 21*s* each.—Nursery and Seed Establishment, Hammersmith, near London.—April 5

THE BLACK AUSTRIAN PINE (PINUS AUSTRIACA).

LUCOMBE, PINCE, AND CO., have a large and healthy stock of this most desirable Pine, from 9 inches to 3 feet high, which having been frequently transplanted, are well-rooted and safe to remove: they can offer them, varying according to age and quality, from 20*s*, 40*s.*, to 60*s.* per 1000 This Pine has been proved to thrive in bleak and exposed places, and in the poorest soils, growing rapidly, and producing dense shelter in places where other trees will not grow; it also thrives well close to the sea, resisting the spray and roughest winds. N. B. The present is a very fine time for planting.

Exeter Nursery, April 5.

SEED AND HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

BASS AND BROWN'S SEED AND PLANT LIST FOR 1851 *is stamped as a Newspaper, to go free by post, and may be had on application. It will be found to contain the newest and best articles which can be procured, with full description and other useful information.*

SELECT AND CHOICE FLOWER SEEDS.

The following of our best selections supplied free by post, with proper directions for sowing, heights, colours, &c., given in the Catalogue.

| | *s.* | *d.* |
|---|---|---|
| 100 varieties best and newest Annuals ... ... ... | 15 | 0 |
| 50 varieties for 8*s* 6*d.*, 30 for 5*s.* 6*d*, 20 for ... ... | 4 | 0 |
| 20 varieties best dwarf kinds, in larger packets, suited for filling beds on lawns. 7*s.* 6*d.*, or 12 do. for ... | 5 | 0 |
| 20 varieties best Greenhouse Annuals, 7*s.* 6*d.*, 12 for ... | 5 | 0 |
| 20 varieties choice Greenhouse Perennials, 10*s.* 6*d.*, 12 for | 7 | 6 |
| 20 vars. choice hardy Biennials and Perennials 7*s.* 6*d.*, 12 for | 5 | 0 |

IMPORTED GERMAN SEEDS.

| | | |
|---|---|---|
| 20 varieties splendid double Stocks, 3*s.* 6*d.*; 12 ditto ... | 2 | 6 |
| 12 vars. splendid China Asters ... ... ... ... | 2 | 6 |
| 12 vars. fine globular Asters ... ... ... ... | 2 | 6 |
| 12 vars. Dwarf Rocket Larkspurs ... ... ... ... | 2 | 0 |
| 9 vars. Tall ditto ... ... ... ... ... | 1 | 6 |

Remittances with orders are requested from unknown correspondents. Goods Carriage Free to London, and with all orders of 2*l.* and up wards, articles presented extra. Post-office orders payable to BASS and BROWN, or to STEPHEN BROWN.

The Gardeners' Chronicle.

| | | | Medical | 8 P.M. |

Now that the most formidable part of the difficulties connected with the arrangements in the CRYSTAL PALACE is at an end, the Executive have turned their attention to minor details, and among other things have arrived at the following decision:

"The Executive Committee are willing to grant spaces in the building to a small number of nurserymen, for the purpose of decorating the building with rare or handsome plants, or for the sale of cut flowers.

"The conditions upon which such spaces will be granted, are the following:

"1. The exhibitor is to fit up his space at his own expense.

"2. He is to keep the space constantly filled during the time the Exhibition is open, commencing from the 1st of May, at his own cost. But as the Executive are aware that considerable difficulty may occur in maintaining the collections in the same excellence in the latter as in the early part of this period, they will be satisfied if the spaces are only filled after July with plants of good foliage.

"3. The plants required to replace such as are removed must be brought into the building, and put in perfect order one clear hour before the admission of the public, in the morning. If any are to be removed, they must be taken away half an hour after the close in the afternoon.

"4. The Executive will supply water without charge; but can incur no other expense.

"5. The exhibitors will be permitted to sell cut flowers in the building, and to distribute cards or lists of the objects they may have for sale on their own premises."

Persons desirous of obtaining space upon the above conditions are requested to make immediate application, in writing, to the Executive Committee, at the building in Hyde-park, stating what kind of plants they are able to exhibit, and how many superficial feet they can undertake to keep filled.

---

OUR correspondents having lately been discussing the merits of the wood of the SPANISH CHESTNUT tree, we find it necessary to interpose with some remarks of our own, which may aid in settling a question that would seem to possess some interest.

Some say that the wood is shaky, and of little value. Others that it is invaluable for Hop-poles. A third mentions the case of "a gate, one part of which had been made of Spanish Chestnut, the rest of Oak, both unpainted, in which gate the former was in far better condition than the latter." Allusion is also made to the supposed use of this timber in the construction of the roof of Westminster-hall.

These statements are equally true, except the last. When young, the wood of the Spanish Chestnut is of the same value as Heart of Oak, so far as durability is concerned; hence its great excellence for Hop-poles, as every Kentish landlord well knows. When old its timber becomes dry, appears to decay, rends in the direction of the silver grain, and thus acquires that unsoundness which timber-dealers speak of by the name of shakiness. French, German, and Italian writers all concur in this statement. But there is a point to which neither they, nor, as far as we know, English writers sufficiently advert, namely, the period of life at which this bad quality first occurs. It is admitted that the timber is excellent when young, bad when old. But what is meant by the terms *young* and *old?* It is desirable to reduce them to some precise signification, and our correspondents might render each other real service if they would state, upon their *personal knowledge*, at about what age the fatal shakiness comes on.

In 25 years, on warm light sandy land, the Spanish Chestnut forms a handsome tree with a trunk 6 or 7 inches in diameter. Does it then become shaky? Most certainly not. Does it at the age of 30, or 40, or 50 years? or when? These are most important questions for planters, and deserve an answer. Mr. SELBY, in his beautiful volume on "British Forest Trees," touches upon this point, when he states that in the course of 50 or 60 years the tree frequently attains a height of 60 to 80 feet; its timber, *even at this age*, begins to get shaky. But it is desirable to know whether this is the rule, or the exception; because in the former case it would be the interest of the planter to fell his Spanish Chestnuts as soon as they are 50 years old. We presume that soil and climate will be found to cause in this tree the variations usual in other cases. There must be many country gentlemen, timber-merchants, and foresters, who could throw light upon this interesting point, and we venture to ask them for the communication of any evidence in their possession.

With regard to the assertion that the roof of Westminster-hall, or of any other old English building, was constructed with the timber of the sweet Chestnut, we cannot but express our surprize that well-informed persons should still relate this fable, after the numberless exposures of it made by ourselves and others. It is, we believe, as certain as anything can be that the roof of Westminster Hall consists of Oak, and of Oak only. It is also certain that in part at least, if not wholly, it was made from the *Quercus se siliflora*, which must, at some distant period, have been common in the southern parts of Britain. We say this upon the evidence of a portion of the roof itself now before us, upon the authority of the late Mr. ATKINSON, who designed Sir WALTER SCOTT'S House at Abbotsford, and who had made the subject his especial study, in the prosecution of which his eminence as an architect gave him great facilities; and upon the testimony of all modern writers who have had access to original evidence. How the mistake arose it is difficult to understand; Mr. SELBY has pointed out its existence in France, where it was corrected by BUFFON and DAUBENTON, as well as in England, where it seems to have originated with HARTLIB, a writer of the 16th century, and to have been incautiously adopted by EVELYN. That it is a mistake there can be no manner of doubt.

---

SOME people are never satisfied with a fact unless they are also able to explain the cause of it, whilst others care little or nothing for the cause, if they are well satisfied as to the fact itself. Probably the right

course to pursue lies half way between these two; but certainly, if we had to choose between the one or the other, we should prefer the latter. One reader remarks, respecting our late observations on the absorption of ammonia by soils, that it is very unfortunate that we are not able fully to explain the cause of this absorption; and another points out that the statement is by no means new, and that the absorption of manure by soils has been long known, as illustrated by the old custom of making compost heaps. It has unquestionably been known for a long time, that soil which is in contact with decaying manure becomes rich and fertile, but the cause of this has never been in any way investigated; and the fact itself, though known to many, has never been systematically recognised, or even acknowledged as a sound practical deduction. In that very curious old book, Sir Hugh Plat's "Jewel House of Art and Nature," published in 1594 by Alsop, "near the upper pump in Grub-street," there are some most sensible remarks on the management of manure in general; and after pointing out the waste which dung generally suffers from drainage, evaporation, and exposure to the air, he goes on to show that the goodness which drains away is not altogether lost, but is in great part absorbed by the soil below. We shall give this statement in his own words: "And here it shall not be altogether unprofitable to let all those gentlemen and farmers, who are desirous of some special good mold for some smal purposes, to understand that after they have disburthened the ground of this great muckheap of theirs, that if they will yet dig a foot and a half or two foot under the same, that by this means they shall obtain a most fat and rich earth, and very apt for divers plants, as our ordinary gardeners can sufficiently witnesse." We might, if it were worth while, quote a number of similar statements from other old authors, all showing that this effect of the soil has been long half known, and yet never applied or studied in the manner it deserved.

A good deal of mystery used formerly to veil the use of lime; there was no doubt whatever as to its practical value, and the important effects which it produced, but the theory of its action was far from being satisfactory. It was well known that all plants contained a portion of lime, and it was therefore pretty certain that they could not grow well in soils which did not contain any lime; beyond this, there was little or no evidence, and it must be confessed that the remarkable effects which lime generally produces, would hardly be supposed to arise from its absorption by the growing plants alone. Liebig showed that one effect which the addition of quicklime to soil produces, is the liberation of a considerable quantity of fixed alkali, formerly existing in the soil in a state of combination, and set free by the chemical powers of the lime. We now see another effect which lime may produce, in its property of aiding the soil to absorb and retain ammonia. It is probable that lime, like all the best fertilisers and improvers, acts in several ways, and that it is, therefore, impossible to explain its action by reference to any one effect exclusively.

## MARKET GARDENING ROUND LONDON.

No. XII.—Is Market Gardening Profitable?—To this question only an approximate answer can be given, owing to the difficulty of getting at the truth of the matter. An acre of early Cabbages on the best land, 18 inches apart, in rows 20 inches asunder, would contain about 17,000 plants or so, which, if all sold at 1*d.* each (and good early Cabbages fetch more than that), would realise about 70*l.*; but then more or less of them always fetch a much lower sum, and, therefore, we must descend in our scale of prices. The above number at 9*d.* per dozen would fetch about 50*l.*, at 6*d.* per dozen about 35*l.*, and at 3*d.* per dozen about 18*l.*; an acre of early white Cos Lettuces, grown after Celery upon the richest land, a foot apart each way, would realise 1*s.* per score of 22 to the score, and if all sold at the above price, the aggregate sum would be 90*l.*, but, like the Cabbages, many are sold for much lower prices. Then after Cabbage or Lettuce take Celery. Some plant this in rows 4 feet distant, while others place it 5 and 6 feet apart, and if large fine heads are desired the plants ought to be 10 inches asunder in the rows—say 8000 plants to an acre. This number, at 1*d.* each, would fetch about 35*l.*; but like other crops, if early and fine, they fetch 15*d.* and 18*d.* per dozen, and there is always an intermediate crop of Lettuce or Coleworts to come off before the Celery wants moulding up. This intermediate crop will fetch about 5*l.*, so that the average receipts of an acre may be set down at 90*l.*

The expenses involved in the production of Cabbage and Celery crops, which occupy the acre nearly 15 months, are as follows:—Trenching an acre, about 2*l.* 10*s.*; 30 loads of manure, at 7*s.* 6*d.* each, say 12*l.*; dunging the trenches for Celery, say 6*l.*; planting the crops, 1*l.* 5*s.*; seeds of various things, 10*s.*; hoeing several times, 2*l.* 10*s.*; rent 9*l.*; tithes 10*s.*; clearing off the several crops, say 4*l.*; washing and packing of produce, moulding up Celery, &c., 4*l.*; horses, waggons, carts, carters, market fees, &c., about 3*l.* 10*s.* Total, about 45*l.*

I am acquainted with a garden which contains 60 acres of choice fruit trees, whose blossoms were all destroyed by frost during three consecutive years. Now, on these 60 acres, the same expenses are incurred every year, whether they bring forth fruit or not; so that taking this loss, that of Broccoli from frost, and other things, into consideration, the profits of the market gardener are not so large as at first sight they would appear. No doubt, in favourable seasons, they make a considerable sum of money; but owing to the vicissitudes of climate, the introduction of duty free foreign productions, and the fluctuation of prices, this desideratum is, at least, rendered very precarious. We have few instances, indeed, on record, of market gardeners becoming rich. By means of perseverance and great industry, however, they manage to live comfortably, and effect much good in the country, by spending large sums of money in labour; but as I have just shown, the profits of the occupation are small.

I have endeavoured to ascertain the number of acres under cultivation for the supply of the various London markets, and the result of the inquiry is, that about 12,000 acres are occupied by vegetables, and about 5000 by fruit trees. These lie chiefly in the counties of Middlesex, Essex, Hertford, and Bedford, on the north side of the Thames; and Kent, and Surrey, on the south side; and some 35,000 people are employed on them. But this is not taking into account those more distant counties which, by fits and starts, send up the produce of acres of Turnip tops, Cabbages, Peas, and other things; while hundreds of acres in Cornwall and Devonshire are employed in growing early Potatoes, Broccoli, Peas, &c., which reach London by rail.

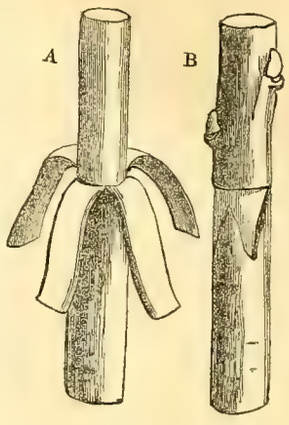
In writing these papers, I have endeavoured, as far as possible, to steer clear of mentioning names of vegetables, knowing well the labyrinth into which such a subject would lead me; for their aliases are endless. Besides, what will suit one soil will not suit another, and the march of improvement is so rapid that sorts highly valued to-day will be thought less of to-morrow, and will ultimately disappear altogether to make room for more valuable kinds. These then are some of my reasons for not mentioning varieties.

In conclusion, I trust that some benefit may have been derived from what I have written on the subject of market gardening; and although a few errors may have crept in, I hope that on the whole they may have given satisfaction. *James Cuthill, Camberwell.*

## GRAFTING.

No. XIV. Square Stamped out Shield Budding: fig. 21. (*Greffe en écusson, de forme carrée; dite emporte pièce.*) *Operation.*—From a strong tree, cut out a square patch, to be immediately thrown aside; raise from a strong branch another similarly shaped piece, but larger, and furnished with an eye; fit this piece into the place of the first; and it had also better be covered with a piece of paper, pierced with a hole for the eye, the whole being secured by a ligature. This mode, but little used, ought to be employed for trees with very thick bark and large eyes; such as Walnut and Mulberry trees. It may be performed in spring, at the particular time mentioned for budding with the pushing eye; or that for the dormant eye, in August, or later.

Fig 21.



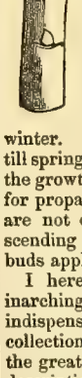
Tubular Budding. (*Greffe en tuyau dite en flûte.*)—For performing the operations of the modes of budding included in this series, we ought to choose the moment when the sap is in most abundant flow, in order that the barks of the two parts may be detached with the least possible effort. This disposition manifests itself at two periods; in the spring, when the ascending sap is in its greatest flow; and in August, when it is governed by a contrary disposition, known under the denomination of the descending sap. A knowledge of the use of these modes is very ancient. At the present day they are only employed for propagating a small number of fruit trees, principally such as Chestnuts, Walnuts, and Mulberries. They may be practised with success on vigorous branches destined to continue the leading shoots of young trees; or on some that are very large, when we would wish to make branches grow similar to those preceding them, for this mode cannot be successfully performed except the woods of both parts are young, or not exceeding one year old.

Although the modes of budding in this series are not numerous, yet they present some slight differences; and each of them has received a number of vulgar names, such as pipe-budding, *en chalumeau;* flute-budding, *en flute ou fluteau;* whistle-budding, *en sifflet;* ring-budding, *en anneau;* horn-budding, *en cornuchet;* cannon-budding, *en canon;* tubular-budding, *en tuyau.* The last name appears to me the most analagous to these modes of budding, inasmuch as they all have this form before being fitted on their stocks.

Of all these I shall only speak of those that are the most in use, and in demonstrating the best of each, I shall mention but two—the first, tubular-budding, with the pushing eye; the second, tubular-budding, with dormant eyes; and, such as they are described, they ought to be preferred for propagating the few plants for which they are suitable.

Tubular Budding with shooting eyes: fig. 22. (*Greffe en tuyau à œil poussant.*) *Operation.*—In spring, when the bark of the stocks, and that of the shoots affording the buds can be easily detached, the branches with the latter are cut off from their parent tree, and immediately wrapped at full length in a moist cloth, and in this they may be kept four days; but it must be better if they are not cut till within a short time before the buds are taken off, and these ought to be very soon put on.

Fig. 22.



Before attempting to remove the bark with the buds from the branch or shoot, we ought to cut off all angular parts above the place where the removal is intended, and the same as regards the stock; then at the summit of the reserved part of the latter we make three or four longitudinal incisions in the bark, in order to separate it the more easily, as is represented by letter A. Then, from among the shoots or branches bearing buds of the sort intended to be worked, we choose always one a little stronger than the stock, and we trace on it two circles which mark the length of the tube of bark, on which there should be at least one good eye, and two when they are not widely apart; see letter B.

This part should then be held in the hand during one or two minutes, in order to warm and expand the bark, which will consequently be more easily detached from the alburnum by a strong twist. This tube should be immediately transferred to the denuded part of the stock; but this being smaller, we strip down the bark till the tube in descending fits tight, all its interior part being then in contact with the alburnum of the stock. Thus adapted, we sometimes bring up the strips of bark around the tube, to protect it from the too great contact of air. At other times, and more generally, the loose bark is cut off; but in this case it is necessary to pare down the naked part of the stock above the tube into thin strips, so as they may form a fringe to protect the parts operated upon from air and water.

Tubular Budding with Dormant Eyes: fig. 23. (*Greffe en tuyau à œil dormant.*) — This is practised exclusively, during the month of August, with wood produced by the spring sap. The part from which the buds are taken ought to be as thick as possible; and as soon as it is separated from the parent tree, we cut off the leaves, preserving a small portion of their petioles; then we should adopt means to raise the buds. This operation differs not from the preceding, except in slitting the bark longitudinally, laying the tube open through its whole length, and thus giving the facility of extracting it from all obstructing or adherent parts. This done we present it to the stock destined to receive it, and of which we preserve the top; the lower part of it should be of the same thickness as the tube of bark to be applied to it. From this part we remove a tube of bark of the same dimensions as the other, by which it is immediately replaced, and so as the edges may everywhere coincide; then it is kept in its place by a ligature, which had better be removed before winter. We defer cutting off the head of the stock till spring, in order that the budded part may partake of the growth. This mode, difficult to perform, is only used for propagating some delicate trees, of which the barks are not easily raised in spring, and of which the descending sap is absolutely necessary for the success of buds applied to them.

Fig. 23.

I here finish the description of the few modes of inarching, grafting, and budding, which I consider of indispensable utility to amateur proprietors. This small collection will, I trust, supply for all that I have rejected, the greater part of which are minute, and of which the descriptions would be tedious and uninteresting to my readers.—*Translated from the French of D'Albret.*

## BRITISH SONG BIRDS.

(Cage Birds, No. 8.*)

No. XXIV.—If you place a water-fountain in the breeding-room, it should be of zinc, and made precisely similar to, though of a less size than, the one described under my observations on an aviary. As, however, it is objectionable for birds, when sitting, to wash themselves all over, it will be needful to have a circular cover

* I am constantly being asked, by private correspondents, *where* they can obtain cages for canaries, goldfinches, linnets, larks, and nightingales, *made according to my own Model*, and fitted up with suitable baths, &c. I am now prepared to refer all such parties to Mr. Clifford, 24, Great St. Andrew-street, Holborn, who has offered to undertake the speedy execution of any orders entrusted to him, either for cages or for birds. He is one of the "very few" who deal honestly in the matter of a *good* "song bird," and may be safely confided in. I have had dealings with him for many years.

of open wire-work, fitted on the top of the fountain. The holes must be sufficiently large to admit free entrance for the birds' heads. Let the water be always fresh, and clean; and the fountain also.

I have remarked on a former occasion, that good song birds lose much of their song, when put up for breeding purposes in a cage. This remark may be somewhat qualified, when the sexes are associated in a *room*. By having more freedom allowed them, and by being kept in one constant round of cheerful excitement, while looking out of their windows, &c., they sometimes continue to sing throughout the season.

Some people turn a number of canaries indiscriminately into a room, and leave them to pair as they will This is kind—very. But it is not wise. By properly pairing them, or at least *some* of them, in small, separate cages; and when paired, allowing them to come together,—each swain then vows eternal fidelity, and is "true," with some few exceptions, to his lawful spouse. Thus alone can the peculiarity of feather and *caste* be properly preserved. Some few pairs of "odd fellows" may perhaps be allowed to intermarry. It will certainly give every possible variety of colour and plumage to your stock; and is, so far, admissible.

At no time should greater care be taken, than in the breeding season, to give your birds good and proper food. Let the canary-seed be large and glossy, and the rape also large and new. The same remark applies to the Flax. These three seeds well mixed together (the two last in smaller proportions), are the proper food for a canary. Bruised Hemp-seed, in very small quantities, may be occasionally given. As birds, whilst performing the duties of incubation, are very frequently subject to constipation, boiled milk, with crumb of bread soaked in it, should be placed in the room at least twice a week. It will do all the birds good. A saucer is the best vehicle for its introduction.

If ever you perceive any of the male canaries to be of a depraved disposition (as they too often are), abusing and persecuting their "better halves;" and showing other anti-conjugal tendencies—mark such transgressors. The cares and anxieties attendant upon the hatching and rearing of a family, are alone sufficiently heavy, without the hen being in addition subject to cruel treatment. Check, therefore, all these innate bad propensities the moment you perceive them; and get rid of the offender summarily. Other suitors will take his place; and her ladyship will feel herself lawfully divorced, "under the circumstances."

When the nests are made, the hens will speedily commence laying. Do not, as many silly simpletons do, trouble yourself about looking at the eggs, or about removing them—substituting ivory "imitation eggs," &c., until the whole batch of eggs shall have been laid. Nature *abhors* any interference of this kind. It is desirable that the eggs should *not* be hatched all at once. The mother can feed her progeny all the better for their appearing one by one. Besides, more warmth is thereby generated for the next forthcoming stranger. Believe me, all officious solicitude about assisting Nature at such seasons, either with birds or with ourselves, is morbid affectation. Nature wants no such aid. Leave the birds to manage their own affairs, and let common-sense preside in the "sick chamber;" then all will be well. Birds hate to be subject to prying curiosity when breeding; so do *all* animals. Some when thus impertinently watched—the cat, the rabbit, and others—make a point, very frequently, of devouring their offspring the instant they come into the world! This fact speaks with a loud voice.

A canary lays, on the average, from two to five eggs; occasionally as many as seven. The time of sitting is 13 days. The duties are shared, during this period, by both parents; but near the time for hatching the female seldom quits the nest. The male, if a kind, affectionate husband, is most assiduous in feeding his "ladye love," as she sits on the nest; and excepting for water, she seldom quits her post for an instant. If, in her momentary absence, the expectant Papa *should* occupy her place—he will most assuredly "nap" it. On her return, he will, by an action of ejectment, have the shortest possible notice to quit; and woe be to him if he resists! *Madame* will enforce her demands by pecks and blows. Her commands are—"Stand not on the order of thy going—but GO!"

If you carefully noted the time when your birds began to sit, you may very nearly anticipate the due time of hatching. On the thirteenth day, the inmate of the first-laid egg will make its appearance. If, within three days, *any* of the eggs remain *in statu quo*, you had better remove them with a warm hand, and place them gently on some warm water in a basin. By their irregular movement, or otherwise, you may pronounce their contents. If alive, they will give evidence of it; if there be no embryon, the egg will be fresh as when first laid. In the former case, carefully replace the eggs in the nest; in the latter, destroy them at once. *William Kidd, New Road, Hammersmith.*

## VILLA AND SUBURBAN GARDENING.

THERE is scarcely any lover of a garden who is not especially partial to Stocks. They are easily grown from seed, and, consequently, unexpensive. Ten-week Stocks are so soon brought to perfection from the seed, that the name is not inaptly applied; they admit of so much variety likewise, besides the perfume they so abundantly give off in a summer's evening, that few amateurs dispense with them entirely, and others would do well to turn their attention to their cultivation.

Good seed is the first point to secure; little of that which is saved in the open air in this country can really be considered first-rate. It would not pay the English cultivator to appropriate his greenhouses, as is done in Germany, to the saving of Stock seed; and when produced in the open ground, the autumns are scarcely sufficiently long to perfect its maturity. The seeds which are imported from Germany, are all saved from plants cultivated in pots in greenhouses; and this constitutes almost a business of itself. They can, therefore, be obtained genuine from any respectable seedsman, and are to be preferred, because of the care taken in saving them, so as to secure a preponderance of double flowers; and also because of the perfect maturity which the seeds attain, under the circumstances.

Where ample convenience exists for their culture, they may be sown in pots about the end of March or beginning of April, and placed in a pit or greenhouse. When fully up and beginning to exhibit their second leaves, they should be potted into 4-inch pots, placing three plants in a pot. When the plants are sufficiently advanced, and all danger from frost is past, they may be turned out into borders or beds, as may be required. Where no opportunity exists of raising them under glass, they can readily be raised upon a slight hotbed protected with mats, and transplanted on favourable opportunities into the flower garden. Plants so raised are, however, liable to suffer much more from removal than those grown in pots, as the roots of the latter do not sustain so violent a shock as those removed from the bed; consequently, showery weather is to be preferred for the operation of transplanting. If planted in patches in the borders, and bright sunshine should follow immediately afterwards, they can easily be shaded for a few days, while the sun is powerful, by placing an empty pot over each patch. Should they be planted in beds, the latter may be temporarily hooped over, and a screen of mats or canvas employed until they have made fresh roots into the surrounding soil. A circular bed of Stocks looks very attractive, commencing with the lightest colours in the centre, and gradually finishing with the darkest in the outer ring. *Pharo.*

## TRADE MEMORANDA.

A CORRESPONDENT expresses a desire to know something of J. Broad, of Norwood Farm, near Leatherhead.

## Home Correspondence.

*Reine Claude Monstrueuse de Bavay.*—Mention of this Plum has been made several times lately in your Paper. I planted it against an east wall in the autumn of 1846, and it fruited for the first time last autumn It is a very large and fine Plum, nearly, if not quite equal to the Green-gage in flavour, and much larger, ripening about 10 days later. It appears a free bearer, having borne last year more fruit than any other out of 12 different sorts planted at the same time. This spring I noticed a peculiarity which may account for its fruitfulness. Although growing very vigorously, it produces flower buds, not merely on the spurs, but also upon the young wood. Shoots between 2 and 3 feet long have flower buds on them. No other Plum, with which I am acquainted, exhibits this habit. A Reine Claude Violette, planted at the same time, has not yet shown one flower bud, and an old Green-gage has comparatively few. They are in similar soil and situation; I therefore infer the new Green-gage to be a more fruitful kind. It is not quite so rampant as the Purple-gage, but stronger than the Green-gage. *J. R., Sevenoaks.*

*The Coffee Plant.*—Will any of your correspondents oblige me by answering the following question:—Are fruit-bearing plants more likely to bear heavily at a low elevation, above the level of the sea, than at a higher, other circumstances being equal? Take, for example, coffee; and it being established that a certain quality of soil and degree of heat and moisture are necessary for its successful culture, which essentials are only to be obtained near the equator by ascending some 3000 or 4000 feet above the level of the sea; and suppose that the same position can be attained in a higher latitude, at the level of the sea, or near it, would not the quantity of produce, *cæteris paribus*, be greater in the latter case? How far might such an increase be supposed to go? It appears to me, that placing other circumstances out of account, or supposing them alike in both cases, plants which derive so much of their support from the atmosphere must grow more vigorously where that atmosphere is dense, than where it is rarefied. *A. C., Ceylon.*

*Mignonette.*—As the common Mignonette has ever been an especial favourite, on account of its sweetness, perhaps the following method of inducing it to assume the character of a bush, may not be uninteresting Not later than the beginning of April, sow a few seeds in deep pots, filled with rich sandy loam, place them in a Melon frame where there is a good moist heat; when they have made about four leaves, pick out all but one strong plant in each pot; as they grow pinch off all side shoots, taking care to leave a leaf at the bottom of each. When the plants have attained the height of 12 inches, they will show their blossoms. The latter must be nipped off, and at the same time the plants will require tying up to thin sticks, with matting; leave them about a week longer in the Melon frame, taking care to pinch off all side shoots, then remove the plants to the greenhouse, where they will have less water and plenty of air; in a short time they will again begin to put out the top shoots, but only one on each must be retained, which must be led up the sticks, and all side shoots again pinched off. By this time the plants will be about eight inches high, the bloom must be again cut off, and the plants still kept in the greenhouse; in the autumn they will put out plenty of shoots from the top, and will form handsome bushes, which will come into flower in the following March; by cutting off the flowers, occasionally, for bouquets in the spring, they will send forth fresh shoots, and will continue to flower all the summer. *Anon, April* 1.

*The Spruce Fir twigs* that are found strewed over the ground below the trees, are bitten off by squirrels. Of late years I have been very much troubled with them, and the only remedy I can discover is shooting them; I find them very actively at work both morning and evening. As they are bitten off, the twigs lodge in the branches, and the first wind that occurs scatters them in all directions. *A. S.*

*The Gardeners' Benevolent Institution.*—If one of the noblest aspects in which our country can be viewed be in the light of its many and varied institutions for the benefit and relief of our fellow-men, then surely one of the noblest characteristics of men, as individuals, is their willingness to support such institutions, especially those which particularly embrace their own countrymen. And if it lays on a man's heart (as it does on that of every right-minded man), to do something, however small, for the benefit of others, the unfortunate or unsuccessful of his own trade or profession have perhaps the largest claim on his sympathy and relief. Some may aid by money, some by work, some by suggestion. The "Gardeners' Benevolent Institution" might be much more efficient than it is, but more cannot possibly be done than is done, unless additions be made to the funds, and its resources enlarged. I beg therefore to throw out a suggestion on this subject which has occurred to my mind, in order that some one better able than myself may take it up, and reduce it to possibility; and so the seed thus cast into the ground at length may become a tree laden with fruit for the nourishment of perhaps some who aid in its growth. I beg therefore to propose a Monster Floral Exhibition in London, in aid of the funds of the above-named institution. To this exhibition I would request every nurseryman, florist, market-gardener, or gentleman's gardener in the country, or any one else interested in the Society, or has a benevolent heart in him, to contribute something towards the general display. At such a meeting I should like to see all animosities and jealousies between different societies and growers thrown overboard, and each striving, not to vie with each other, but to do all that he can towards the production of a grand, and hitherto unprecedented display, alike worthy the object and the name of a British gardener. I would exclude nothing, however common, if good and showy, from such an exhibition; for numberless gardeners and nurserymen, especially in the unfavourable districts around London, for the growth of what we generally term show plants, could make a brilliant display of the more easily cultivated, though by some considered less worthy subjects. I should propose no entrance fees, and no prizes. The gratification that each exhibitor would experience at the general good he would feel himself an assistant in, would, I believe, be far greater than the value of many of the prizes given by other than first-rate societies. But, in lieu of prizes, I would suggest that certificates might be given, which should entitle the holders to a graduated scale of votes for the next election, or otherwise, as might be determined. I would also propose, that such an exhibition should be open for two days—*i. e.*, that the plants, &c., should be all ready for the censors by 10 o'clock one day, so as to open to the public at 2 o'clock, at, say 5*s.* a head by ticket only, and the next day for "the million," say from 10 o'clock till 5, at 1*s.* a head. Should this suggestion be taken up in earnest by any of the readers of this Paper, and the thing assume a form, I might perhaps add a few more hints; but I think if it find supporters at all, it will also find many far more able to carry out details than the individual who, as he said before, only pretends to drop a seed which he believes to be new, and hopes will prove good and *G. R. O. W.*

*Training Cherry and Plum Trees.*—In 1843 I made some notes in a scrap-book respecting the training of fruit trees; and year after year facts convince me that Cherry and Plum trees cannot be trained horizontally against a wall with so much success as on the fan system. Although the Cherry makes shoots freely, the yearly increase in size is seldom more than a layer of branches and the leader; if more is aimed at, it is often acquired at the expense of some untidy curve, in order to bring the shoot into its proper place, and years are needed to make a fine tree. Before the top is completed, how often do we see one of the under branches gum and die, and sometimes two, if a shoot from a spur does not present itself in a fit place to be laid in? We have a bare place on the wall, because the lower part of the tree is too old to produce a shoot. My first notes relate to some May Duke Cherries, which had lost their under branches in the way I have described, and I have notes of other kinds in a similar condition. The Cherry gums more readily in some situations than in others; and I have also remarked that trees have done well for some time after planting, until the roots have found their way into a cold heavy soil below. This may not be the immediate cause of gumming, but it is often the cause of ill health, and gumming follows; we often find a tree exude sap when a nail comes in contact with the bark; this is sometimes cured by lopping it off, and covering the wound with clay. In gardens where I have found the Cherry planted

in a dry sandy loam, and on a well drained bottom, these evils have not presented themselves, unless by accident. I do not find a single note of failure in regard to fan-training. If a branch gums and dies under this system, a young shoot may be laid in or an old branch made to fill its place, and the space is filled up as if nothing had happened. In summer a few young shoots should be nailed in, in case of accident. This is, however, not the only advantage which fan-training possesses; for when the tree is young, nearly all the shoots may be nailed in, and in a few years we have a fine tree full of neat fruiting spurs; a little care being required to regulate the branches on either side, and to give the extreme points a tendency upwards, so that the sap may divide itself equally. The same rules should be carried out in regard to training the Plum on this system. By this means the tree may be brought into a bearing state much sooner, and a fine head obtained in less time. The old Orleans Plum is, perhaps, one of the best for horizontal training. The Greengage, too, makes a tree readily, but it soon presents unsightly spurs. Many of the new Plums require to have their sap better distributed, or we have a long robust shoot on one side, and a weak one on the other. In some soils and situations they grow more equally; but when the tree begins to establish itself, it then throws out strong useless shoots from and near the stem, especially if the branch is on a curve, as sometimes is the case in such a situation. If the previous rules on fan training are carried out, the sap will be equally diffused over the whole tree. *W. Culverwell, Thorp Perrow.*

*Spanish Chestnut.*—I can state, for the information of your correspondent, that I have felled two Spanish Chestnut trees of apparently 60 or 70 years' growth, and measuring, in round timber, from 30 to 40 feet each. One of these grew in my garden, the other in a coppice near, on the Kentish rag-stone hills. The Spanish Chestnut is well known in Kent, where it is generally planted for Hop-poles, which are of the first quality. The trees in question, though of vigorous growth and apparently sound while standing, proved both of them nearly worthless as timber; not so much as a gate post could be cut from them, the wood coning and splitting throughout. The best of it was at last used as a wall plate to carry the rafters of a stable, it would bear so much shaping. *S. S.*

*Rockwork.*—I want a composition to wash a mass of artificial rock in a plant house, of a good colour to harmonise with foliage, wet or dry, and not to wash off. Portland cement dries too pale, and Roman is too "dirt colour." *Micklewell.* [Mix Portland cement with soot, or fine cinder dust.]

*Effect of Sea-weeds upon Orchard Trees, applied as a Top-dressing round the Root.*—Early in February of last year I put in 150 high standards, including nearly every variety of Apple, Pear, Plum, and Cherry; also Mulberry and Walnut; the trees being generally six or eight years old. In the summer most of them bore a little fruit; they were dressed as above with sea-weed (of which there is abundance on my shore), contrary to the advice of all around me; and, notwithstanding the fruit borne, it is a fair subject of inquiry, whether sea-weed may be beneficial or otherwise to fruit trees. *X. Y.* [There is no doubt about its being useful.]

*Protecting Conifers from Cattle.*—About 10 years ago I planted a Cedar of Lebanon, with other ornamental trees, in a large field in front of my house. It has prospered there to such an extent, that although I have twice moved the railing with which it is surrounded, its boughs are now again within reach of sheep. What must I do with it? I cannot go on extending the fence year after year until a tolerably sized garden is enclosed. Nurserymen advise me to allow the fence to remain as it is, so that the sheep may eat the ends of the lower boughs, and thus, they (the nurserymen) say, more strength will be thrown into the leading shoot. What think you of this advice, or should I shorten the boughs with a knife? Will the lower boughs die in course of time? *J. T. C.* [We think the advice of the nurserymen right.]

*Broccoli.*—As the season for sowing Broccoli seed is now at hand, I take the opportunity of again recommending every gardener who can do so to procure Snow's superb autumn Broccoli, which is by far the best of its season that has come under my notice. To ensure the genuine sort I always obtain my seed direct from Mr. Snow, whose address is West Park, Selsoe, Beds. This sort alone furnished me with a regular supply of compact heads, as white and as sweet as a Cauliflower, from the middle of November to the middle of February; it is therefore no small acquisition to a gentleman's garden. *J. B. Whiting.*

*Stove Aquatics.*—The Nelumbium of the Caspian grows in the waters of the Delta of the Volga, a day's journey at least below Astrakan. The climate is infinitely colder than that of the same latitude in France during the winter, and proportionally hotter in the summer. Which of the blue Water-Lilies is likely to require the least heat, and how are they certainly distinguished? What species is the pink Water-Lily of the West Indies? Is not Caspicum as good Latin as Indicum, Virginicum, &c.? If one winter's experience be sufficient authority, Aspidistra may be added to our hardy aquatics. *S.* [N. cærulea is the hardiest; N. stellata is very tender. Is N. scutifolia still in cultivation?]

*Tropæolum tuberosum.*—I know of nothing more grateful to our feelings than a deliberate experiment proving successful. I had an idea, from observations on other plants, that a dry ripe bulb of Tropæolum tuberosum, if put into a strong bottom heat, would send up a flowering shoot at once, before it had time to think, as it were, of meandering and morphologizing till October as usual, before it chose to organise flower buds. The bulb was potted tricolorum fashion in a little pot, within a larger, and plunged in a bark bed. The first shoot produced four flowers at once, when a foot or two high, after this it rambled and grew wood without flowers, as I anticipated. *Micklewell.*

*Size of Conifers.*—The following is a list of the principal Conifers grown here, some of which have attained a large size:—

| When planted. | Name. | High | Diam. |
|---|---|---|---|
| | | Feet. | Feet. |
| 1832 | Abies Douglasii ... ... ... ... | 45 | 25 |
| 1842 | „ Menziesii ... ... ... ... | 9 | 8 |
| 1836 | „ Smithii ... ... ... ... | 10½ | 6 |
| 1831 | „ Deodara ... ... ... ... | 26½ | 21 |
| 1839 | „ Webbiana ... ... ... ... | 16 | 10 |
| 1843 | „ Fraseri ... ... ... ... | 10½ | 6 |
| 1840 | Pinus insignis ... ... ... ... | 34½ | 28 |
| 1833 | „ Cembra ... ... ... ... | 21½ | 12 |
| 1839 | „ taurica ... ... ... ... | 25½ | 11 |
| 1843 | „ macrocarpa ... ... ... | 24 | 20 |
| 1843 | „ Massoniana ... ... ... | 14½ | 12 |
| 1846 | Cryptomeria japonica ... ... ... | 14 | 11 |
| 1846 | Taxodium sempervirens ... ... | 13 | 10 |
| | Araucaria imbricata ... ... ... | 12 | 7½ |

*Charles Barclay, Bury Hill, near Dorking, Surrey.*

*The Chrysanthemum, a Spring Plant.*—I send you two Chrysanthemums, blooms from one of a couple of plants which I have now coming into strong flower on the young wood of last autumn. If the circumstance is at all unusual, and you think the specimens good, and the time of flowering desirable, I will send you a memorandum of the experiment, which was made with a view of getting the plants to perfect their seeds. *Micklewell.* [The blooms were beautiful, and the experiment is very curious and interesting. Pray send us the account.]

*Rain, &c., at Itchen Abbot (Hants.)*—

| 1850. | Quantity of Rain | Days on which Rain fell. |

*Summer Treatment of Vines in Greenhouses.*—In a lean-to greenhouse, which the sun at Midsummer leaves at 3 P.M., for years I never could obtain ripe Grapes; after the half-hardy plants were taken out, there was not, according to ordinary treatment, sufficient length of summer left; the growths were lanky; and in October, when the house was wanted again as a greenhouse, the Grapes were about half ripe, and no fire seemed to hasten them enough. This was under the principle of "plenty of air on all day and close early, to shut in the sun heat." I have not much time to give to gardening, but I thought that a rapid and sturdy growth might be obtained with the same trouble or less than before. The following simple management secured this perfectly:—In the middle of April, all the plants which are required to be kept in form, are removed elsewhere. Alternate lights in the roof are slid down 6 or 7 inches, and not moved again under any circumstances during the whole summer; the door and lower windows always kept closed; and the house and Vines syringed to soaking with soft water every morning, at 8, in hot weather and, on bright days, again at noon. I had the last two years, in September and October, as fine Hamburgh and Chasselas Grapes as ever were seen. The whole advantage of the system seems to arise from the very high temperature obtained during sun-light, as high sometimes as 110° Fahr.; while the great moisture prevents parching, and, on the sun leaving, all excitement ceases, and the effects of a natural evening are in some measure induced. I cannot understand why, to this day, so many experienced gardeners recommend "shutting in plenty of sun heat." Surely the temperature should decline with the light. I believe a little actual frost would do less harm. The late Mr. Andrew Knight tried and approved of syringing overhead with the coldest water as soon as the sun was down, giving all excitement an instantaneous check; and I should adopt this, only I cannot dispense with the moisture at my other times, and syringing three times a day would be too much. *W. T. B., Witham.*

*Hardy Plants.*—Some time since I was in company with a gentleman who had spent several seasons on the Himalaya mountains. He was fond of gardening, and our conversation quickly turned on some of the many topics in connection with the subject. Rhododendrons came in for their share of attention, and I elicited from him, that often the blossoms of thousands on their native hills are cut off by the spring frosts, precisely as the early varieties suffer in the majority of seasons in this country. On the Himalayas the plants on the southern slopes of the ridges are the invariable sufferers, while those on the northern seldom or never sustain any injury. This he justly attributes to the influence of the sun on the frozen plants. Their energies are aroused by the return of spring, mild days often succeed each other; a sharp frost follows accompanied by a bright morning sun, and the result is the death of the tenderer part of all the plants subject to such influence. Now, although many persons have for years profited by such a knowledge, there are many more who have not recognised the lesson the disaster teaches. There can be no question that the failure in certain localities of plants to stand the winter and spring frosts, arises very often from causes which might be removed. In the South of England Camellias can be grown and bloomed in the open air with tolerable success, provided they are planted in such a situation that the morning sun in winter and early spring does not shine upon them. The same with early flowering Rhododendrons. If you can afford an awning the day following a frost, provided it be not too severe—to plants showing colour—you may preserve them; while others, not so protected, perish, or are much mutilated. Any ordinary observer will here remark, how much less damage is experienced by vegetation, if a cloudy or rainy day follow the preceding night's frost. Upon this principle, the gardener waters his French Beans before sunrise, after a sharp frost, with what benefit need not be mentioned. The fact is patent. Now, there are hundreds of plants, the culture of which would be rendered much more satisfactory in the open air, by simply recognising the principle of what I here alluded to. The very beautiful and not sufficiently known Chinese plant, Jasminum nudiflorum, suffers much by the faint suns of January and February, when a bright day succeeds frost. A mass of rich blossoms in the open air in midwinter is not to be lightly mentioned. Yet the claims of this useful plant, which realises such a desideratum, is scarcely recognised. By judicious care, it becomes an invaluable acquisition to our gardens. Some weeks past, I was going through a very pretty garden, accompanied by the proprietor, and as we were passing a flower border with a north aspect, carefully screened from the south by a high wall, I was struck with a large Rhododendron dauricum a mass of blooms. Of course I could not help admiring it. Its owner made the following statement to me:—"I have possessed that plant," said he "for several years. Till the season before last it occupied the warm nook you see yonder; it put forth, year after year, abundance of blossom buds, but I never enjoyed them in their beauty. Ten to one but a sharp frost, followed by a slight rain, rotted the half of them; if a few blossoms did struggle into light, they were poor unsightly things. A friend advised me to give it a northern aspect, and with what success you are a witness." The management of out-door plants is a subject worthy of attention. I shall some day beg to return to the subject. *G. L.*

*Bees.*—I find my bees to be as active this year as usual, perhaps your correspondent's bees are weak or dead. They should be examined, for they may require feeding; or if dead, the hives should be moved. *A. S.*

## Societies.

Horticultural, *April* 1.—Dr. Daniel, Secretary, in the chair. Messrs. Veitch sent a plant in a pot, and a cut specimen, from a bush growing in the open border, of the Darwin Berberry (Berberis Darwinii), a new small-leaved evergreen shrub, from Patagonia. This proves to be a species whose importance it is almost impossible to overrate, inasmuch as it is exceedingly handsome, perfectly hardy, and naturally produces its rich orange blossoms in great profusion during the early months of the year. Indeed for general value we have nothing at present at all to be compared with this fine Berberry. A Large Silver Medal was awarded it. The same nurserymen also furnished a bloom of the pretty light-coloured striped Camellia, named Countess of Orkney.—Messrs. Hayes, of Lower Edmonton, communicated two nicely-managed plants of tree Violets, for which a Certificate of Merit was awarded.—Messrs. Standish and Noble produced a beautiful new Carnation-striped Azalea, named vittata, from China, which promises to be an acquisition. It is quite distinct from any of the striped kinds and very early. A Knightian Medal was awarded it. The same nurserymen likewise contributed a flowering plant of Viburnum macrocephalum, raised from a cutting struck last autumn, and Limonia laureola (Skimmia japonica), a sweet-scented shrub, from the mountains of India, and said to be hardy about Kingsbridge, in Devonshire. It was stated that its natural character is to produce fruit of brilliant scarlet in autumn. A Certificate of Merit was awarded it.—From Messrs. Henderson, of Pine-apple-place came Hebeclinium ianthinum, a promising greenhouse plant, with Ageratum-like flowers, which were reported to last long in perfection; and a charming collection of Hyacinths, of which the following are the names of some of the best:—*Light blue:* Orondates, Robinson, Nimrod, Grand Vidette, Grand Lilac, and Passe tout (double). *Dark blue:* Laurens Koster (double), Prince van Sax Weimar, Emicus, Baron van Thuyll, Prince Oscar, and Mignonaude Dryfhout (double.) *Violet:* Tubal Cain, William I. and Prince Albert; the latter is very dark. *White:* Helen, Grand Vainqueur, Grand Vidette, La Candeur, and A la mode Epuisée, double white, with a pink centre. *Blush:* Grandeur de Meneilles, Anna Maria, (double), Triumph Blandina, ditto, and Tubiflora. *Plum:* L' Unique, a variety much prized for its colour, which is new to Hyacinths. *Yellow or buff:* Anna Paulowna, Heroine (double). *Deep rose:* Amphion. *Red:* Herstelde Vreede, Diebitsch Sabalskansky, Appeluis, Le Francq de Berkhey, and Waterloo (double). *Light red:* La Dame du Laack, and Lord Wellington. The same nurserymen also sent examples of Narcissi, among which the best were, Nannette, yellow, and Radiator, white with a yellow centre. A Certificate of

Merit was awarded for the Hebeclinium, and a Banksian Medal for the Hyacinths.—Mr. E. G. Henderson, of the Wellington-road Nursery, St. John's Wood, sent an Ixora, two seedling Rhododendrons, a crimson and a light kind; and a well grown plant of Dielytra spectabilis, for which a Banksian Medal was awarded.—The same Fumewort, evidently grown in less heat, and more highly coloured, was exhibited by Mr. Clark, nurseryman, Brixton-hill; but by far the finest specimen of this Dielytra was produced by Mr. Edmonds, gr. to the Duke of Devonshire at Chiswick House. The latter was, however, unfortunately disqualified from receiving any prize, on account of its arriving too late, it being especially required that all subjects of exhibition shall be in the room two clear hours before the time of meeting, The same thing happened in regard to a Java Rhododendron from Messrs. Rollisson, which also came too late to fall under the consideration of the judges.—From Messrs. Lane, of Great Berkhampstead, came a single white seedling Camellia, a specimen of the sweet Trichopil (Trichopilia suavis), and four large boxes of cut Roses, fresh and beautiful as just gathered from their Rose house. They consisted of *Hybrid Perpetual:* Baronne Hallez, crimson; Baronne Prevost, blush, large and beautiful; Caroline de Sausal, blush; Chateaubriand, delicate pink; Comte de Montalivet, rosy crimson; Cornet, bright pink; Dr. Arnal, deep crimson; Duchesse de Gallieria, shaded pink; Duchesse de Praslin, blush, with pink centre; Duchess of Sutherland, glossy blush; Edward Jesse, lilac crimson; Gen. Cavaignac, rosy pink; Géant des Batailles, vermilion; General Negrier, rosy blush; George Lecamus, rosy blush; La Belle Amerique, shaded pink; Lady Alice Peel, rosy crimson; Louise Aimée, pink, light edge; Louis Buonaparte, bright rose; Madame Guillot, rosy crimson; Madame Laffay, crimson; Madame Trudeaux, brilliant carmine; Marquise Boccella, pale pink; Miss Pepin, delicate pink; Mrs. Elliot, crimson; Polybe, rosy purple; Princess Beljioso, rose; Queen, brilliant rose; Regulata, pink; Reine des Fleurs, pink; Reine Mathilde, light pink; Robin Hood, lilac rosy pink; Sidonie, bright pink; Standard of Marengo, crimson lake; William Jesse, crimson, tinged with lilac; Comte Robrinsky, beautiful crimson. *Bourbon:* Armosa, rosy blush; Augustine Marget, delicate bright rose; Bernardin de St. Pierre, brilliant carmine; Dupetit Thouars, rich carmine; Emilie Courtier, bright reddish crimson; Le Grenadier, bright lake; Madame Angelina, salmon yellow; Queen, delicate salmon; Speciosa, shaded rose. *China:* Abbé Mioland, fine crimson red; Fabvier, striped crimson; Miellez, lemon white; Mrs. Bosanquet, creamy white. *Tea:* Belle Allemande, cream, shaded blush; Comte de Paris, cream; Devoniensis, creamy white, buff centre; Goubault, salmon-shaded rose; Madame Bravy, creamy white, salmon centre: Niphetos, pale lemon; Smith's Yellow, pale straw; Vicomtesse de Cazes, golden yellow. *Noisette:* A fleur Variable, rosy salmon; Cloth of Gold, yellow; Jeanne d'Arc, lemon white; Mrs. Siddons, fine yellow. A Banksian Medal was awarded for the Roses.—Mrs. Lawrence exhibited a fine specimen of Enkianthus reticulatus, two species of Boronia, the beautiful violet-blossomed Mirbelia floribunda, Phaius Wallichii, Maxillaria Harrisonii, an Oncidium resembling sarcodes, and a new and very curious Epidendrum, bearing a long, drooping, green flower, which terminated in a broad rich orange-coloured fleshy lip, vieing in brilliancy with the E. vitellinum itself. It was stated that it would probably produce flowers in clusters, and if so, it must be considered a great acquisition. A Knightian Medal was awarded for this, and a Banksian Medal for the other plants.—Messrs. Loddiges sent a handsome pale rose-coloured Rhododendron, raised from Nepaul seeds; and Mr. Myatt, of Deptford, showed two nicely-flowered Cyclamens.—A box containing 15 Easter Beurré Pears, packed in tin cases buried in salt, was received from Mr. Daniel Curtis, of Boston, United States. Seven of these cases were opened, in which were found three fruit good, and four spoiled. These Pears were stated to have been ripened by a method peculiar to Mr. Curtis, the nature of which was not explained. They were, for the most part, melting, sweet, and perfectly ripe, a condition which this Pear attains with difficulty with us in England. The mode in which they were packed is new, and when it is considered that the fruit must have been quite ripe when put into the boxes, it may be pronounced to be successful; but as each tin box contained only one fruit, it will be evident that it is too expensive for adoption on a large scale. A Knightian Medal was awarded.—Mr. Rust, gr. to W. Everett, Esq., sent from a Polmaise House B. Hamburgh Grapes, which received a Certificate of Merit, on account of their being the first that have been exhibited to the Society this season.—Mr. Higgs, gr. to J. Barchard, Esq., sent Keens' Seedling Strawberries; and a seedling Strawberry very like the Roseberry, was produced by Mr. Cooper, of Yeovil, Somerset.—A "fruit gatherer" was exhibited by Mr. Nevill, of Crutched Friars, and some very nice ornamental flower stands by Mr. E. G. Henderson, of the Wellington-road Nursery.—From the Garden of the Society came the fine specimen of Epidendrum auranticum, which was exhibited at a previous meeting, Maxillaria Harrisoniæ, Angelonia moschata, Cyrtoceras reflexum, the purple Gesnera, Boronia tetrandra, Eriostemon cuspidatum, three varieties of Epacris, two species of Cytisus, Franciscea Hopeana, Forsythia viridissima (again produced in excellent condition), the Gesneraflowered Sage (Salvia gesneriflora)—a kind very like cardinalis, two varieties of Cineraria, and a panful of the Cochlearia acaulis, a very interesting little plant at this season of the year. The following cuttings were distributed among Fellows: Powis Castle, Forme de Délices, Broom Park, Pears; and the Early Harvest Apple.

---

LINNEAN, *April* 1.—Dr. N. WALLICH, Vice-President, in the chair. A collection of 200 species of Ferns from Java was presented by M. de Vriese. A continuation of Dr. Frederic Buchanan's commentary on the Hortus Malabaricus of Van Rhede, was read by the Secretary. The plants which formed the subject of criticism were various species of Leguminosæ, more especially those known as sensitive plants. With reference to the Æschynomene lagenaria of Roxburgh, the author had some difficulty in accounting for the trivial name, unless it was that the plant was sometimes cut up and made into bundles and placed under the arm by fishermen in swimming, in the same way in which the emptied gourds of the Cucumis lagenaria were employed. He objected, also, to the specific name of Crotalaria verrucosa, as no appearance was seen on this plant to justify this appellation. After the reading of the paper, Dr. Lankester enquired if there was any probability of this valuable commentary being published, as it had now been in the hands of the Society above 20 years.—Dr. Wallich pointed out the value of the criticisms of Dr. Buchanan, and referred to the subject of misnaming species. Roxburgh found Thunbergia odorata amongst a number of sweet-swelling plants, and so named it, whilst in reality it had no smell at all.—Mr. H. Cuming defended Roxburgh's name for the Æschynomene, as it probably referred to the fact of the use made of the soft tissue of the plant to cork bottles. It was suggested that probably the Hon. East India Company would assist the Linnean Society to publish Dr. Buchanan's commentary.—Mr. Kennedy exhibited a block of indurated sandstone, from the Cape of Good Hope, with very deep and perfect impressions of a fossil plant, belonging probably to the family of Ferns, and allied to the Lycopodia.

## Garden Memoranda.

MESSRS. KNIGHT AND PERRY'S, KING'S ROAD, CHELSEA.—Since we last visited this establishment the principal entrance has been greatly altered and improved in appearance, as well as rendered in all respects more commodious. A new glass house has been erected in the Nursery for the cultivation of the Royal Water-Lily and other stove aquatics. The roof consists of two wide spans placed on brick walls, and supported in the middle by small iron columns. The tank is 3 feet deep and upwards of 30 feet square. It is made of slate beautifully fitted together, and as yet perfectly water-tight. Indeed, judging from its present appearance, no danger of its ever leaking need be apprehended. The large plant having been lost in removing it from the old aquarium, a young Victoria Regia has been placed in the centre of the tank, and has progressed favourably, considering the time it has been planted. In the same tank the blue Nymphæa (N. cærulea) was growing and flowering most luxuriantly; and when six or seven of its charming blossoms are all open at a time, as was the case in the present instance, few plants are more interesting or striking. Indeed no amateur who has the convenience of an open cistern in his stove, should be without this truly delightful aquatic. But desirable as low-growing water plants are, their beauty is very much enhanced by the skilful introduction of a few Nelumbiums, Caladiums, and other taller growing kinds, whose large and handsome leaves rising out of the water break the uniformity and flatness of appearance which would otherwise prevail, and give the whole much additional interest. These have been planted in the tank in question, and are growing with great vigour, a remark that equally applies to all the plants it contained. This may be attributed to the slight motion which the water receives from the constant overturning of a small pail or bucket, which is filled from a pipe rising about 2 feet above the water, and to other circumstances being favourable to a healthy development. The shelves are fitted up with pans for the growth of the smaller kinds of water plants.

## Miscellaneous.

*Model of a Greenhouse, 4 ft. 2 in. square, on the ridge and furrow, flat-roofed principle.*—On the repeal of the glass duties, Messrs. Hartley and Co. erected several of these, with a view of showing how the materials of glass and iron, or wood, could be best adapted for the economical construction of conservatories. They put up one in the gardens of the Horticultural Society of London, in 1846, and sold several others, among the rest one to W. H. Walker, Esq., Newcastle. Mr. Hartley was the first person to suggest the flat ridge and valley roof for buildings of this kind, thereby doing away with a lap-joint in the glass—a great desideratum—for each ridge is glazed with one single square of glass. He recommended the Royal Commissioners twelve months ago, long before Mr. Paxton came forward with his plan, to adopt the principle for the Crystal Palace, offering, as we have heard, to furnish specimens and estimates for the whole building. A section of a ridge and valley roof was exhibited, the span being ten feet; thus giving in a building such as the Crystal Palace multiples of ten, in place of eight feet, as in that building. This, however, with the high wages paid to Frenchmen, who are employed to blow sheet-glass, would add greatly to the cost, were sheet-glass employed. Messrs. Hartley, foreseeing this in 1846, invented a description of cheap rough plate, with which the section of roof is glazed, the size of the squares being 62 inches long, and 18 inches wide. This glass is one-eighth of an inch thick, or 30 oz. to the foot (the glass in the Crystal Palace is 16 oz. sheet, or one-sixteenth of an inch thick) and, per pound, is the cheapest description of glass manufactured, being sufficiently strong to resist any hailstorm. *Sunderland Herald.*

*An Antiquated Honeycomb.*—We have now on the table before us a substance calculated to excite the curiosity of naturalists. It is a portion of a honeycomb. A large log of Honduras mahogany was cut in the premises of Mr. Vance, of Russell-street; and in it, near the centre, was found this honeycomb. The log was two feet square; no perceptible hole could be found in any part of it, connecting with the place where the comb was imbedded. The honeycomb is very brown, with a smoke-dried look; some of the cells are quite perfect, and we noticed in one part the head and the wing of a small bee. We shall not attempt to speculate on the immense number of years that comb may have lain in the heart of the tree. How it got there we leave naturalists to conjecture. *Northern Whig.*

*The Chinese Primula.*—At a season when all nature appears dull and almost inanimate, this beautiful plant makes our greenhouses lively and attractive; and much as has been said respecting its culture, no mode of treatment which I have seen advocated appears to me to possess advantages like that which I have been in the habit of pursuing. I sow the seed in a gentle heat in the beginning of April. As soon as the plants are up and sufficiently large to handle, I prick them out under handglasses at the bottom of a west wall, and shade them for a few hours during the day while the sun is powerful, giving them now and then a sprinkle with a fine-rosed watering-pot, and keeping them close. When they begin to grow, the glasses are removed at night, as the dew of the morning greatly strengthens them, and it is astonishing how fast they advance in growth. When sufficiently large, I pot them into 4-inch pots, and place them in a close frame until they have become established a little, after which the lights are drawn off every night in fine weather, and air is given in the daytime by tilting the lights at the back, shading the plants lightly during the hottest part of the day. When the pots have become filled with roots, I repot into 6-inch pots, in which they are flowered. When they come into blossom, the most fimbriated and best-coloured ones are carefully selected and marked. After they have done blooming, and rested for a short period, the greater portion of the soil is removed from the roots, which are cut pretty close in; at the same time the stems of the plants are cleared of old leaf-stalks, and everything is made clean and neat. They are then repotted in the following compost; equal parts turfy loam and peat, with a portion of well-decomposed cow-dung, and silver sand in it. The compost is used in a rough state, with broken crocks below it for drainage; and the pots employed vary from six to eight inches in width, according to the strength and size of the plants. After potting they are placed in a close frame and treated exactly as recommended above. In this way I have grown splendid plants; and some have done better the third year than the second, but I have never tried them for a longer period. By following the same plan every year, fine plants and good sorts are secured. *Beck's Florist, Fruitist, and Garden Miscellany for March.*

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

HEATHS and other hard-wooded greenhouse plants should be potted as they require it. Generally speaking, the most suitable time is after they have done flowering, and commenced a new growth; but the operation may be performed with propriety at any season when the roots are making progress, without being induced thereto by unnatural excitement. Before potting, take care that the old ball is sufficiently moist; for if it is potted in a dry state, it will be impossible afterwards to moisten it properly, without souring and saturating the new soil. The Epacris family is now so numerous, so beautiful, and so valuable for winter flowering, that for country establishments they outrival Heaths. Let them have all possible attention in repotting, and let them be kept rather close and moist, until they have commenced a free growth. At this season we give these plants a slight forcing; and they amply repay us for their more liberal treatment, by a splendid growth, and abundance of early flowers. As soon as the flowering is over, the future shape of the plants should be adjusted, by removing a portion of the old flowering stems; and, that their energy may be devoted solely to the growth of the plant, seeds should never be allowed to come to maturity, unless they are very valuable. Let climbers, both in pots and borders, have due attention with regard to training, and retain no more shoots than the allotted space will afford room for. A succession of Achimenes, intended to flower late in the autumn, should now be placed in heat, and treated according to the directions given in former Calendars. Some of those of former successions may be potted for suspended baskets; for which the A. longiflora and cupreata are particularly adapted. Pans, or broad shallow pots, are preferable for their general cultivation; and, as they require an abundant supply of moisture when they are in flower, let the drainage be very perfect, that they may be freely watered without stagnating

the soil. CONSERVATORY.—Besides the permanent plants in this structure, many choice plants in pots will be required, to keep a succession of gay flowers throughout the summer. Amongst the finest for this purpose are Brugmansias, Erythrina Crista-galli, Thunbergias, Stephanotis, Mandevilla suaveolens, Allamandas, Echites, Achimenes, Ipomœas, with Heaths and Pelargoniums. Let these have all possible attention, and bring them forward in several lots, so that one set may succeed another. Pay particular attention to the Liliums now in pits, by giving them a liberal supply of water, and by neatly staking them. A top-dressing of turfy peat, sand, and well-decomposed cow-manure, will be of great benefit to them; and they will be very useful for conservatory and drawing-room decoration late in the autumn. Let Fuchsias, which are so useful for summer and autumn flowering in the conservatory, be repotted, as they require it, in rich compost, watering them occasionally with liquid manure. Nearly all the varieties have a natural tendency to form conical bushes, and by a very little attention they may be guided into this appropriate form. One strong shoot should be selected to form a leader, and should be trained perfectly upright, the remaining shoots being regulated by stopping any which are growing more luxuriantly than is consistent with the proper shape of the plant. VIOLETS.—These are everybody's flowers, and to have them fine and in abundance, they require and well merit some share of attention, particularly where they do not naturally succeed well. In some situations they grow so strongly, and flower so abundantly, that they merely require at this season to be taken up, parted, and replanted, and if kept free from weeds, all will go well; while in other places they are frequently more trouble than a collection of Auriculas or Polyanthuses. A frame on the north side of a wall is the most likely situation for preventing the attacks of the red spider, to which they are very liable, and which causes them to lose their foliage during the winter. About the beginning of September they should be planted in a frame upon a spent Melon or Cucumber bed, where they will have time to establish well before winter; and if frost is excluded, and plenty of air given at all times during fine weather, perfect success may be expected.

### FORCING DEPARTMENT.

PINERIES.—Keep up a high day temperature to fruit which are now swelling, and admit air freely, so that a circulation may be produced to keep the plants strong and of compact growth. If the latter be not attended to, the plants will grow weakly, and have an unhealthy drawn-up appearance; while, as regards fruiting plants, the crowns will increase in size instead of the fruit itself, which will be watery and deficient in flavour. Take advantage of every fine afternoon to syringe the pits, and close them for two or three hours before sunset. Remove all gills and useless suckers, that the whole energy of the plant may be occupied in perfecting the fruit. VINERIES.—Successional Vines which are just starting may be indulged with a good heat, and particularly Muscats, which were ripened late last year, as the wood of such is not generally so well matured as that of the earlier forced Vines; and unless they are encouraged by a temperature rather higher than usual, until their blossoms are fairly set, the shows for fruit, however strong they may be to all appearance, not unfrequently prove abortive. A somewhat higher temperature for Vines in all stages, than would be safe or prudent two months earlier, is, at this season, not only admissible, but beneficial; accompanied, of course, by a proportionably liberal supply of fresh air, to prevent the scorching which is so much complained of. Attend punctually to the stopping and training of the shoots, and to the thinning of the berries on the Vines in the earlier stages. Maintain a moist atmosphere by evaporation where the berries are swelling, particularly in fine clear weather; but this must be moderated as soon as they begin to change colour, and air must be more freely given. PEACHES.—Let all very vigorous growths be stopped as soon as they have made six or eight leaves, to divert the flow of sap into the weaker growths; this is a much better plan than allowing them to make long Willow-like shoots, to be removed by the knife, a month or six weeks hence, or perhaps at the end of the season. Avoid a high night temperature, or the fruit, though ripened considerably earlier, will be obtained at a sacrifice of size and flavour.

### FLOWER GARDEN AND SHRUBBERIES.

BEDDING PLANTS.—Lose no time in potting off, or pricking out into frames or boxes, young cuttings as soon as they are sufficiently rooted, and seedlings as soon as they will bear handling. As the potted-off plants become established with new roots, they should be gradually inured to the open air. The hardier kinds, if in pots, may be set upon a bed of coal ashes, or plunged in the open air, and protected at night by hoops and mats. If plunged in old tan, ashes, or other light material, much of the labour of watering will be saved, and the plants will be in a better state when planting-out season arrives. But, as we mentioned in a former Calendar, the most economical plan is to plant them out in frames, and at the proper season to remove them to the beds with balls. Patches of some of the more showy of the hardy annuals should now be sown in vacant places, which usually exist in the herbaceous beds, and in the edges of clumps and borders in the shrubbery. Among the many kinds excellently adapted for this purpose, we may mention the following:—Double Poppies of various colours, Lupins, Sunflowers, African and French Marigolds, Godetias, Erysimum, Clarkia, Gilia, Collinsia, Silene, Eschscholtzia, Nemophila, Nolana, Kaulfussia, &c., not forgetting the old-fashioned favourite Mignonette. A sufficient quantity of cuttings and seedlings of half-hardy climbers should now be potted for planting out in May. With such plants as Cobœas, Maurandyas, Lophospermums, Calampelis, Loasas, Tropæolum canariense, &c., many bare places on the walls and trellises may be covered and made ornamental, which would otherwise be unsightly blemishes on the general appearance of the place.

### FLORISTS' FLOWERS.

The continuous wet and mild weather brings every description of plants forward very quickly. Pansies have been more than usually exposed to the attacks of slugs and similar pests; but what with traps, and a little examination in the evening with candle and lantern, the bed may be kept tolerably free; and this is absolutely necessary if the amateur wishes to enjoy his bloom. Cuttings may be taken as they grow, and seed should be sown in pans. TULIPS.—We always stir the surface soil of our beds just a little, but a friend of ours a few years ago seriously injured his bloom, by moving the soil too much; as for moisture, we think the bulbs will have had sufficient to last them over the blooming season. In covering, there is a middle course to steer; it is all very well protecting from hail and frost, but the net, which is the protection in severe weather, is detrimental in very fine; therefore the sides should at all times be raised, otherwise the flower-stems are apt to be drawn, to the serious detriment of the bloom. PINKS.—Top-dress the beds, and fill up vacancies from the reserved; also pot off Carnations and Picotees as speedily as the weather will permit. The sooner the better now.

### KITCHEN GARDEN.

Continue to make periodical sowings of the different culinary vegetables, of which a successional supply is required. Spinach should be sown once a fortnight, and Peas, Beans, and Turnips, once in three weeks; sowings of all Salads should be made with strict regularity; and proper attention should be paid to protectiog all kinds of seeds from the ravages of birds and insects. If the crops of Onions, Leeks, Parsnips, Beet, Salsafy, Scorzonera, and Skirret, are not yet sown, it should be no longer delayed; and the main crop of Carrots should be sown this month, if the ground is in good order. A sowing of tall Kidney Beans may now be made in early localities; the early sowing of this useful vegetable is frequently cut off by late spring frosts; but when this happens, the ground should be left undisturbed, as that part of the plant beneath the surface of the soil generally throws up shoots, from which a crop will be produced nearly as soon as if the leaders had remained uninjured. In sowing Peas, it is the most workmanlike method to put the stakes to them at once; as, by so doing, the barren appearance of the ground is removed, and no more trampling on it is necessary for a long time; besides which, they afford a slight shelter to the young plants on their first appearance above ground. Transplanting of autumn sown Cabbages and Cauliflowers should be finished, and the spring sown ones encouraged. FORCING VEGETABLES: FRENCH BEANS.—Let these have an abundant supply of water at the roots, and use the syringe freely amongst the foliage. No description of plant is more liable to be infested by the red spider; and if other species of plants are grown in the same house or pit, it is scarcely possible to prevent the spread of the disease. When the structure in which they are growing is heated by other contrivances than flues or hot-water pipes, a wash of lime and sulphur should be applied to the walls in the inside, especially on those parts upon which the sun can shine. The fumes arising from this are very efficacious in destroying the red spider. A succession of Seakale should be brought into the Mushroom shed, or into frames, to keep up the supply. Rhubarb will now be coming forward so rapidly out of doors, that the forcing of this useful vegetable will no longer be necessary, particularly where that truly useful kind, "Myatt's Prince Albert" is grown.

State of the Weather near London, for the week ending April 3, 1851, as observed at the Horticultural Garden, Chiswick.

## Notices to Correspondents.

BACK NOS.: Full price will be given for 1, 1846, and 42, 1850.

BIRDS: *Georgius.* How to rear *young* birds will be treated of next week, in "British Song Birds," No. XXV. Yes; "blackcaps" *are* good songsters, the finest of the "warblers." For directions to "preserve birds," see "Taxidermy," a small volume published by Longman and Co. *W. K.*

BOOKS: *Lady M.* You can scarcely do better than purchase Knight's works for your Village Library and Reading Room. "The Land we Live in," "Pictorial Half Hours" and "Half Hours with the Best Authors," are more especially suited to the purpose. If the funds permit, we should add his "National Cyclopædia of Useful Knowledge."—*X Y Z.* We cannot say when the last edition was published; but as the work is stereotyped, the edition is immaterial. You will find "Babington's Manual," 2d edition, better, and more recent.—*T H.* Roberts on the Vine, with the exception of his instructions about carrion, which should not be followed.‡

CALENDAR OF OPERATIONS: *J R.* We do not intend publishing it in a separate form.‡

FRUIT TREES: *A T C.* You may plant the following against a south-west aspect:—1 Moorpark Apricot, 1 Royal do.; 1 Royale Hâtive Plum, 1 Greengage do.; 1 Elton Cherry, 1 Florence do.; and the Glout Morceau, Winter Nelis, and Passe Colmar Pears.‖—*A W, Walton.* The Plum which you describe as being so delicious is probably the Reine Claude Violette. The shoots of the Orleans Plums are downy. You should bud your seedling Apricot towards the end of July.‖

GLAZING: *J B.* By all means let your panes overlap; and take care that there is space enough between the laps to allow the water to run off. If you use wide squares, there is, in that case, no risk from frost.

HEATING: *G L.* One flow and one return pipe, along the front, will be amply sufficient for your purpose. You may save the pipes at the two ends.

INSECTS: *J H E.* Your description of the habits of the Acarus, found partly on the leaves of your Cucumbers and partly on the surface of the bed, and to some extent beneath it, makes us doubtful as to the kind of insect in question. Can you not send us specimens? Fumigation carefully applied would destroy the former, and saturation with quassia or tobacco decoction would probably be a remedy against the latter. *W.—R M J, Broadstairs.* Your lawn is infested with the grubs of the common daddy-long-legs. We can only advise you to turn up the Grass, first driving a lot of ducks on the lawn; and when the flies appear, employ children to catch them. *W.*

IVY: *J Grosvenor.* There is no known process by which your desire could be effected.

NAMES OF PLANTS: *Pinus Hibernicus.* 1 and 2 are both P. insignis. The difference in appearance is owing to the leaves not being, in one case, fully developed.¶—*Medicus.* Melilotus leucantha, no doubt. It is, or was, in the trade, under the name of Bokhara Clover.—*J C.* We cannot undertake to name florist flowers.‡—*Redwood.* Iris tuberosa; Anemone pavonina. As to the Narcissi, we will endeavour to determine what Haworth called them; but it is a sad waste of time. You will not find collections of them in nurseries; Botanic Gardens are the most likely places.—*C A B.* Your question requires some consideration; look for an answer next week.—*C M—l.* Next week.—*Jas. Reith.* Hillia longiflora.—*F M.* We cannot undertake to name microscopical cryptogamic plants. 1 is Leparia viridis, 2 is perhaps Peziza cinerea.

NERIUM: *Young Gardener.* Your heat is sufficient, but it is possible that you do not give it enough of water. It is a plant which likes abundance of water at the root, when it is growing.‡

ORCHARD HOUSES: *Subscriber from the first.* You will find our opinion fully given in a leading article, at p. 35, of this year's volume. No doubt they will answer the purpose. They are rough, but that is of no consequence where appearances are disregarded. You should set your own carpenter to work to make you a place. If you put the work into superior hands, you will find the expense greatly increased. Their cheapness is one of the recommendations of Orchard Houses.

SEEDS: *Simon.* As far as is known, a very weak solution of oxalic acid in water is the best fluid in which to steep seeds whose vitality is languid. The seeds must be watched, and removed as soon as there is any sign of incipient germination.

STUDDING WALLS: *A Lady.* The article is too long to reprint. If you will send us six stamps, we will send you the Paper containing it.‡

SUPERPHOSPHATE OF LIME: *J M C.* This is advertised in our columns, to which we refer you. We have already stated (pp. 791, 1850; and 180, 1851), all that we *can* state about its use in gardening. As to doses—there are no rules, except to administer too little rather than too much. You must experimentalise for yourself. The same may be observed of intervals between doses.

THREAD PLANTS: *W F S* will thank some of our correspondents to recommend him a method of preparing or extracting thread from such plants as Phormium tenax, Yucca filamentosa, &c., Agave americana, or other plants of that nature, of which there are many said to produce a strong fibre. Or describe the way of using, or preparing for use, the leaves or juices of Agave saponaria.

VARIEGATED HOLLIES: *H H H.* Graft them now on the common kind.‡

WAGES: *A Sub.* What a man obtains depends upon what he is worth, and how the market is supplied. A gardener, in a botanic garden, requires to be well acquainted with practical botany and the refinements of horticulture—sober, honest, industrious, and studious. His foreman should be like him, although, of course, of inferior attainments.

WARD'S CASES: *E L B.* Any clever worker in wood or metal, or any dealer in hand-glasses, can supply them. They are too common for us to be justified in recommending one person in preference to another.

WATER LILIES: *Micklewell.* We are not aware of the fact you mention. The seeds of Nelumbium keep very well for years, but it is sometimes found necessary to thin a part of the shell with a file. We doubt the possibility of buying seeds of Nymphæa Lotus.

MISC: *Ignoramus.* We can only spare room for the following memoranda:—Selago distans, greenhouse shrub; Echeveria pulverulenta, ditto; Browallia Jamesonii, ditto; Cestrum auriantiacum, ditto; Candollea tetrandra, ditto; Prostranthera rotundifolia, ditto; Gardenia Fortuniana, stove shrub; Cyrtoceras multiflora, ditto; Henfreya scandens, ditto; Sericographis Ghiesbreghtiana, stove herbaceous plant; Æschynanthus Lobbianus, ditto; *Æ. pulcher*, ditto.

### SEEDLING FLOWERS.

CAMELLIA: *T D* and *C.* Worth cultivating, though at present a little confused in the arrangement of the petals.*

CINERARIAS: *R C.* A very pretty variety, with a good petal; but too loose and too ragged in the centre, we fear, ever to become a great favourite with florists.*

RHODODENDRONS: *Anon.* Baron de Berg is a small deep crimson resembling our English R. Hendersonii. Judging from the bloom sent, it is deficient in shape. Francofurtense, rosy pink, and spotted in the upper petal, appears to be a showy flower, but it also looks as if it were defective in shape.‡—*J L.* 1, rosy pink, with leaves 8 inches long, by 2¾ broad, and slightly ferruginous underneath, partakes more of Arboreum than Campanulatum; 2, evidently belongs to the last-named species; 3, leaves 7 inches long, by 2¾ broad, and ferruginous underneath. Flowers, somewhat small, white, and spotted, with rosy dots, which, in one of the blooms, are disposed in straight lines up the petals. All distinct, and very handsome sorts.*

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS,

AS THE

ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by Dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | |
|---|---|
| Clover Manure, per ton ... ... ... | £11 0 0 |
| Turnip Manure, do. ... ... ... | 7 0 0 |
| Superphosphate of Lime ... ... ... | 7 0 0 |
| Sulphuric Acid and Coprolites ... ... | 5 0 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

ARTIFICIAL MANURES.—PRIVATE INSTRUCTIONS in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.

Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

PHOSPHATE NODULES, OR COPROLITES AND FOSSIL BONES (from the Suffolk Crag).—Manufacturers of Superphosphate of Lime can be supplied with the above, either in their natural form or finely pulverised, on the best terms, f. o. b. or delivered in the Thames.

Applications to EDWARD PACKARD, Chemist, Saxmundham, Suffolk, will receive prompt attention.

MANURE DEPOT.—PEAT CHARCOAL.

TO FARMERS, AGRICULTURISTS, AND OTHERS.

G. H. FOLEY, Essex Coal Wharf, Lea-bridge, Middlesex, Agent by appointment to the Irish Amelioration Society, for the sale of the above. All needful particulars will be given on application at the above address.

Price of the unmixed Charcoal, 60s. per ton, sacks included. Mixed with Nightsoil, 45s. per ton, sacks included.

FOR PUBLIC SALE, at the New Corn Exchange Tavern, Mark-lane, on MONDAY, April 7, 1851, at 2 o'clock precisely, by order of Messrs. ANTONY GIBBS and SONS, the Importers, about 600 TONS DAMAGED PERUVIAN GUANO. Catalogues and further particulars in due time, from J. A. RUCKER and BENCRAFT, Brokers, 26, Commercial Sale Rooms, Mincing-lane, London.

HOSE FOR LIQUID MANURE, Fire-engine, and agricultural purposes, made of canvass, lined and coated with gutta purcha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure, it is extensively used at the Government public works; also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, Esq., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND CO. beg to notice their mixtures of GRASS SEEDS for Laying Land down to Permanent Grass, are now ready for delivery. They have reduced the price to 30s. per acre, allowing 2 bushels 12 lbs. to the acre.

Mixed sorts for improving old Grass Land, 1s. 2d. per lb.

Fine sorts, for forming Lawns, 1s. 3d. per lb. Directions for sowing will accompany the Seeds.

GEORGE GIBBS and Co. will feel happy in sending general priced Catalogues of Agricultural and Garden Seeds, on application to 26, DOWN-STREET, Piccadilly, London.

GRASS AND OTHER SEEDS.

THOMAS GIBBS AND Co., the Seedsmen to the "Royal Agricultural Society of England," corner of **Half Moon-street** Piccadilly, beg to call the attention of their friends to the following Seeds:

Mixtures of selected Natural Grasses for laying down Land to permanent Meadows and Pastures, apportioned to suit the nature of the soil.

Mixtures for portions of Parks near Mansions.

Mixtures for Garden Lawns and Grass Plots.

Mixtures for renovating Old Pasture Land.

Italian, and other Rye-grasses.

White Belgian and Red Altringham Carrots.

Gibbs' new very large Parsnip.

Orange Globe Mangold Wurzel.

Long Red and other kinds.

Drumhead and Thousand-headed Cabbages.

Swedes, Hybrids, and other Turnips.

Clovers, Kohl Rabi, French and English Furze.

Sainfoin, Rape, Tares, White Mustard, and all Agricultural and Kitchen Garden Seeds, &c.

Priced Lists are now ready, and will be forwarded free, on application, by post, or otherwise, to corner of **Half Moon-street,** Piccadilly, London.

AGRICULTURAL SEEDS

BASS & BROWN'S PRICED AND DESCRIPTIVE AGRICULTURAL SEED LIST may be had free by post. The following of best quality delivered free to London, Ipswich, Norwich, or any station on the same line of Railway.

PERMANENT PASTURE GRASSES, to suit various soils.—Mixtures for soils in general, including proper proportions of Clover, per acre, 24s.

Mixtures supplied to suit soils of every description, the nature of the soil being stated; and if intended to be sown either with or without a crop. Any sorts supplied separate, if required, according to order, of which a list of prices of different kinds may be had.

FINE MIXED GRASSES FOR LAWNS, BOWLING GREENS, &c., 40s. per acre, 5s. per peck, or 1s. 3d. per lb.

| | | | |
|---|---|---|---|
| RYE-GRASS, true Italian ... | per bushel | 6s. | 6d. |

The best Stock of Turnips and all other Agricultural Seeds. See our Catalogue. Prices to the Trade on application.

BASS and BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

GRASS SEEDS FOR LAYING DOWN PERMANENT PASTURE.

W. DRUMMOND AND SONS, SEEDSMEN, Stirling, N.B., having been among the first to recommend the use of the NATURAL GRASSES in the formation of PERMANENT PASTURE, the subject has occupied a large share of their attention. They have carefully noted the species composing the best Natural Pastures, and the results of combinations in culture under varied circumstances of soil and situation; and, as the result of their observation, as well as from the great satisfaction their selections have given, they feel warranted in recommending, in addition to the Grasses usually sown, a variety of such species as are known, not only to yield the greatest bulk of herbage, but the largest amount of milking and feeding properties, varying those species, and the proportions of each, according to the nature of the land to be laid down; and from the low price of their Seeds this season, the expense is not materially increased. The very best Mixture they can give for PERMANENT PASTURE or MEADOW will not exceed 20s. to 22s. per statute acre. The quantity of each variety comprising the Mixture is given in detail with each parcel.

| | s. | d. |
|---|---|---|
| Mixture for Renovating old Pasture Lands, per lb. ... | 0 | 6 |

With every other description of FARM SEEDS, priced Lists of which may be had free on application.

N.B.—Seeds are delivered, *carriage paid*, to most of the principal Shipping Ports and Railway Stations throughout the Kingdom.—Agricultural Museum, Stirling, N.B.

# The Agricultural Gazette.

*SATURDAY, APRIL 5*, 1851.

MEETINGS FOR THE FOLLOWING WEEK.

WEDNESDAY, April 9—Agricultural Society of England.
THURSDAY, — 10—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, — 16—Agricultural Society of England.
THURSDAY, — 17—Agricultural Imp. Soc. of Ireland.

THERE are probably few districts in England which are more capable of improvement than that known as the Weald of Kent, Sussex, and Surrey; few which would make better returns for the money expended on them; and few where the march of improvement will be more retarded, not only by want of capital, but by local habits and prejudices.

In a geological sense the Weald denudation consists of the triangular area lying between the chalk escarpments of the North and South Downs. It is one of the few large districts of England and Wales in which there are but slight traces of the superficial deposit, and in which the characters of the soil depend chiefly on those of the rock formations. Within this triangular area is another triangular space called the Forest-ridge, consisting of one of the lower divisions of the Wealden group, namely, the Hastings or Iron-sand. From this central ridge the Weald clay dips away in opposite directions under the cretaceous rocks of the North and South Downs, forming a belt of clay soil on each side of the Forest-ridge. It is to this clay district that our remarks apply. The peculiar characters of the Weald clay arise from the minute division of the particles both aluminous and siliceous, of which it is composed. This causes it to run, when wet, into a compact paste, which dries into a mass as hard as brick, and nearly as impenetrable by the roots of plants — a tendency which must be still further increased by the constant use of lime as the sole manure. Such a soil, under arable culture, must be expensive to manage, and far from productive, and in its present state it produces undergrass, but scanty and poor herbage. Its natural application is to woodland. Its Oak is celebrated for its quality, and was formerly celebrated for its size, but the high prices of the war have stripped the Weald of nearly all its large timber. The farms and inclosures are in general small. We know many occupations in which the fields do not average more than five acres, interspersed with woods and coppices, and surmounted with broad coppice, like hedges or shaws, so as to give to the landscape, when viewed from an eminence, the appearance of a forest, which it actually was since the Conquest. In its legal sense the Weald is the district in which woodland is free from tithe. The old and prevalent system of cropping is—1, fallow; 2, Wheat; 3, Oats, Beans, or Clover; and then fallow again. Little stock is kept, little manure of course made, and that of inferior quality, and too generally applied to the Hops, of which the better soils of the Weald produce a great burthen, though of coarse quality. The turn-wrest plough, with its four and even six horses, prevails through that part of the Weald which lies in Kent, but it has not established itself in the adjacent counties. This fact we submit to the consideration of those who contend that in agriculture "whatever is, is right," and that experience has discovered in every district the implement and the system of cultivation best suited to it. The climate of the Weald of Kent cannot differ from that of Sussex and Surrey, and uniformity of soil is one of the characteristics of the district. Why then the difference? Why, but because it is a Kentish implement, has the turn-wrest plough, only adapted to dry soils, established itself on the wet soils of that county, and of that county only? With this ponderous implement it is not uncommon to see at least four horses stirring a fallow, at the rate of about three-fourths of an acre a day; and by the custom of the country, five ploughings are the preparation of a Wheat fallow. The produce which is to repay such costly cultivation is wretched in the extreme, not on the average more than 20 bushels of Wheat, 30 bushels of Oats, and 28 bushels of Beans. Under such a system it is needless to add that with rent at 12s., and tithes and parochial rates amounting to about 5s. more, the tenants cannot pay their way. They demand a reduction to 8s. The large landowners are complying with the demand; and if prices shall continue at their present level, that will be the most that can be obtained without an entire change of system. Enough, however, has been done in the way of improvement to show that the Weald is capable of better things. The quality of its Wheat is excellent. All that is required is to increase the produce, and to diminish the useless costs of cultivation. There are cases in which the average produce has been raised by good farming to 3½ quarters of Wheat, 6½ quarters of Oats, and 4½ quarters of Beans.

The first steps in improvement consist in draining and the grubbing of hedgerows, so as to raise the average size of the fields to 10 or 15 acres. The next is to alter the texture of the soil by the addition of substances which will prevent the particles from running together. These are chalk, burned clay, and organic manures. Chalk for burning into lime, which is nearly the sole dressing which the land receives, is carted, in many cases, nine miles, and burned on the farm. Double the quantity used in this way with each fallow would last, if applied in the raw state, 20 years. The Wealden is crossed by the Brighton railway, and the northern clay district is traversed through its whole length by the Dover railway, each of these affording chalk at their extremities; and chalk and other mineral manures may be carried by railway 30 miles at the same expense as that of carting them five miles.

In those parts of the Weald not accessible to chalk, the abundance of wood, now of little value, offers great facilities for burning clay. Some of the strata of the Weald clay are slightly calcareous, and were formerly applied in their raw state under the name of marl till the large proportion of clay was found injurious added to clay, and recourse was had to chalk lime. By selecting these beds for burning, where practicable, calcareous matter will be added to the soil, and the objectionable properties, when used in a raw state, will not only have disappeared, but they will have assumed a new character as imparters of porosity to the soil.

The next step in the process of improvement is a gradual substitution of green crops for the bare fallows, and to get much of the land laid down in good condition to Grass, to be fed with sheep. Tares and Rape might be grown for summer sheep-feed; and, in time, after draining and subsoiling, Swedes and Wurzel, to be drawn in the autumn while the land is dry, and to be stored for consumption in the yards, might be brought into play, and would ensure a supply of that of which the soil stands so much in need — animal and vegetable manure. There is no reason on earth to prevent the soils of the Weald being ploughed, if taken in proper season, with two horses. On the whole there are probably few districts where a good farmer, not afraid of stiff land, who could command capital enough to purchase his farm, and to cultivate it properly, could lay out his money to better advantage than in the Weald, availing himself of the

facilities of the Government or Private Loan Drainage Act for the permanent improvement of draining. *E. W.*

---

Our own case is one of the numerous instances of the folly of boasting. Ever since a self-gratulation was indulged in at the perennial stream of poultry knowledge which flows from the office of the *Agricultural Gazette*, its letter-box has been filled with anxious inquiries; and the consumption of postage stamps has been so great, that, were not Queen's heads like those of the Hydra—cut off ever so many, and they are reproduced somehow—the penny portrait of her Majesty would by this time be found only in the cabinets of *virtuosi*.

It is not every sybilline leaf which reaches us, that need be presented to the perusal of our readers in this place. Only now and then a more suggestive one than usual may advantageously be allowed to escape from the close guardianship of the editorial locker. "A. W."—latitude, longitude, and altitude of residence quite indeterminate—has converted his or her delightful garden into a poultry-walk; but the fowls do not appear so likely to thrive as the flowers did. One of the hens, a pullet, drops every other night, *while at roost*, an egg without a shell! Last Friday an egg (a portion forwarded for inspection) had fallen into ashes placed to receive the droppings; its form was that of an inflated balloon, with the pipe for its inflation attached. And on Sunday, in the same place, another egg, equally defective as regards shell, appeared.

Now so far the case is common enough; and as hens after recovering from the tendency to abortion (for such it is) are very liable to relapse into the same disorder again, we should have been inclined to answer the question, "What shall I do for the hen?" in the words of echo—"*Do for* the hen." She would, ordinarily, be best eaten, or made into soup. But we are further informed "the garden walks are laid with spar and *refuse from lead-works*. I expect the poor birds are suffering from bellund (?). Their eggs are streaked or blotched with blood, and some of the yolks have spots of blood upon them. I observed the fowls, after rain, drinking water by the carriage-drive; this seemed to tell me that they must soon fall victims to such infusions. They feed well, but all are poor."

Enough is here said to suggest the idea that either poultry-keeping must be given up on this unindicated spot, or that the walks, &c., composed of pretty but deleterious materials from lead-works ("from lead-works!"—the very name inspires ghastly terror) must be broken up, and replaced with honest gravel and stone. Other particulars are mentioned by "A. W.," from which it would appear that the fowls are in a chronic state of slow poisoning. The reader knows as much about their homestead as ourselves, but the pit's mouth is a poor substitute for the barn door. We have often wondered whether any poultry are kept, and how, in the flaming, desert region between Wolverhampton and Birmingham. Coal and iron would not act unhealthily; so there may be no danger to be apprehended there. But combinations of copper and lead, with other elements, are some of them so poisonous, that we may conceive a bird, in the mere act of pluming itself, to gather enough noxious matter on its bill to put it out of health, at least. Cats are often poisoned by licking themselves clean after rubbing against paint. The amateur is more liable than the farmer to such accidents amongst his fowls, and it is worth bearing the possibility in mind, when any inexplicable disease makes its appearance.

But the farmer is not entirely safe from these untoward events; poisons are sometimes used upon his premises, and poison, like slander, when once let loose, often spreads over a wider area than was intended. In fact, there is no limiting its effects. A pennyworth of arsenic, successively employed, might be made to destroy a whole nation. We once had a few sheep dipped. The ingredients of their bath were kept secret; one certainly was creosote, others probably were tobacco water, perhaps corrosive sublimate, perhaps arsenic also. The sheep did well, and were freed from their ticks; but a few days afterwards turkeys, fowls, and ducks died in sad succession. There was no grain lying about which could get steeped in that vile broth—the reverse of Medea's youth-renewing soup—and the probability is, that the dropped parasites eaten, or even the worms sent up and killed by the drippings from the sheep, were sufficient to cause a partial blank in our poultry-yard.

---

## CULTURE OF CARROTS ON POOR LANDS.

On poor sandy soils, which do not adhere from sheep-treading, I would recommend the Carrot to follow Turnips that have been thoroughly cultivated, and afterwards fed off on the land with fatting sheep to which corn or oilcake is given. The land may be scarified, and then ploughed and subsoiled after the fold, and in a few weeks the natural pulverisation and solidity, resulting from exposure to the elements, will bring the soil into a beautiful state for the reception of the seed. A rolling and two double tines of the harrows will be found necessary to give further solidity and tilth before drilling, the latter to be followed by a light rolling. It may be alleged that this system throws the Carrot in the place of a corn crop, and that consequently a portion of the expense of the cultivation of the previous crop of Turnips must be charged upon the Carrots. But, granting this, the chances are in favour of the Carrots producing a greater profit per acre than the corn crop, and leaving the soil in far better condition for the following crop. It must be understood that I am alluding to the poor siliceous soils, upon which 3 quarters of Wheat, 4 of Barley, and 10 tons of Turnips, are esteemed abundant crop. The after management will be the same as that described in a previous paper; the produce will vary from 400 to 750 bushels per acre, whether of the red or white varieties, or from 8 to 15 tons. This, at 1*l.* per ton, the price at which they are occasionally sold off the land, will amount to from 8*l.* to 15*l.* per acre; and the tops, either fed on the land or ploughed in, are equivalent in value to the fold manure from the previous crop of Turnips. The rest of the crop will be somewhat as follows, taking men's wages at 10*s.*, and women's at 5*s.* per week, and that the crop is cultivated upon a soil that admits of easy tillage. (See Transactions of Highland and Agricultural Society's Journal for 1850.)

The straw used for covering the roots is still available for litter. From 5*d.* to 6*d.* per bushel is the price at which Carrots are frequently sold from the field, where no expense or risk of loss from storing is incurred; and if we put the actual cost at 6*l.* per acre, and the average value of the crop at only 12*l.* 10*s.* per acre, it leaves such a balance that will defy any poor land farmer to obtain from a corn crop, particularly at the present free trade prices, that follows Turnips fed off, and the land will be left in a better condition for corn than if it immediately followed the Turnip crop.

In the neighbourhood of large towns there is a constant demand from cow-keepers and stable-men for Carrots; and we know of no root used for feeding cattle which will yield so large an amount of produce from poor lands, or that may be removed with so little exhaustion to the soil. Professor Way has suggested, that as the long root of the Carrot derives most of its nourishment from and pulverises the subsoil, it is a good preparation for grain and other plants whose roots feed chiefly upon the soluble particles nearer the surface.

Upon a farm where Carrots are annually grown to the extent of from 5 to 10 acres, during 14 years there were only two crops that produced less than 500 bushels per acre, the remaining 12 averaging from 500 to 1400 bushels, or from 10 to 28 tons, and these crops were grown on poor sands and gravels, the gross rental of which could not exceed 25*s.* per acre. The value of Carrots to the farmer depends upon the produce of the Turnip crop: when this is below an average they become of higher value; and it is a convenience to have a root which, being stored, is equally nutritive in all kinds of weather, which admits of general application, and is so nutritious for all kinds of cattle. At the present time of low prices for grain and remunerating prices for stock, this system of growing Carrots is worthy of especial attention, as the taking two green crops in succession will lay a foundation for a more abundant grain crop, which is the only means of compensating for its unremunerating price.

To the labourer, the value of the Carrot, when compared with the Potato, will be found equally great. Carrots may be bought at 6*d.* a bushel; Potatoes are now seldom less than 2*s.* a bushel. A few pence will purchase seed sufficient for a bed of Carrots or Parsnips, whilst the cost of the seed Potatoes becomes an important item when taken from the labourer's pocket. From the Carrots or Parsnips the probability is that he will obtain, with common attention, a root that will furnish him with a good supply of winter vegetable food; while, if he continues to plant the Potato, the chances are in favour of their being taken off from year to year by the prevailing distemper, and the crop will barely exceed the value of the seed.

---

## DEEP DRAINING AND OPEN FURROWS.

The high reputation which Mr. Mechi has most deservedly attained as an agricultural reformer, renders an erroneous opinion enunciated by him so much the more dangerous. As he invites criticism on the soundness of his opinion with regard to the necessity of open furrows, where land has been thoroughly drained, I trust he will not think me wanting in courtesy if I thus openly in your columns avow my entire dissent from him in this matter. We both agree as to the necessity of deep draining: by deep I mean 4 feet and upwards. The superior efficiency of deep drains, I believe, will be philosophically explained and experimentally proved by a well-known agriculturist in the next Number of the Journal of the Royal Agricultural Society, so that I am content to leave this part of the subject without further comment.

My dissent from Mr. Mechi's opinion will be very briefly expressed by the statement of a few facts, which I consider to be of more value than any lengthened theoretical refutation. I have drained land of the very stiffest description over a very considerable extent (during the last eight or ten years), and have had no occasion to use any furrows whatever. The land upon which I have operated is the *gault c'ay*, which is by many degrees stiffer and more compact than the London clay (the geological site of Mr. Mechi's land in Essex). Here for acre after acre there is not a single furrow, and I can safely assert that after the late unusually heavy rains of last January upon these fields, when the rain had ceased an hour or two no water whatever could be seen, though it was running away in torrents through the drains. To this statement an objection may be raised, that the land is cultivated as Hop-ground, and therefore is no fair specimen of ordinary agricultural proceedings. I cannot admit the validity of such an objection, though I can afford to put aside the testimony derived from my stiff soils thus employed, as all my stiff common farming lands tell the same tale; for in them the furrows are the same distance apart as in my lightest sands—in other words, as water-conduits they are not needed at all. The explanation I have to give is this: that in these most tenacious clays, thorough draining is employed in the correct sense of the term. Many years ago I experimented on this description of land on a small scale; and I then found that the drains ought not to be more than 15 feet apart in order to be thoroughly efficient. This gave me confidence as to the method to be adopted in my future proceedings, though I must confess I was half deterred by the prospective cost: it was enormous, equal to half the fee simple of the original value of the ground. But I persevered, and I am happy to add that I have had no reason to repent of the outlay, as I have been amply repaid in the subsequently exuberant fertility of the soil thus treated. In this land, the drains are from 4 to 5 feet deep, and from 12 to 15 feet apart. The cost was 16*l.* per acre. And here I again repeat, that, after the heaviest rains or melted snow, the surface of the land is in appearance as dry as if it rested on a sand bed. With these facts continually before my eyes, when I hear of the necessity for open furrows, I cannot but infer that land so requiring them has not been thoroughly drained, deeply enough, probably, as in Mr. Mechi's case, but not thickly enough. This is, of course, extremely disagreeable intelligence to the farmer, yet, if it be correct, it is not the part of wisdom to shut our eyes to the truth. Only a few years ago, what is commonly termed thorough draining was a most unpalatable necessity, obtruded upon landowners, and was for a long time resisted; but it is now almost universally acknowledged to be the foundation of good farming, and they only have acted wisely who have obeyed its requirements. But, on the other hand, it may be stated, for the comfort of the farmer in these disastrous times, that this very stiff land, after drainage, with proper cultivation and manuring, is capable of producing enormous crops, both of corn and roots; this I can testify to from experience.

And, by the way, with regard to root crops, which on this character of soil were formerly almost useless, because they could neither be fed off nor carried away without spoiling the land, we have, thanks to Crosskill, of Beverley, an instrument by which this formerly inaccessible crop is rendered as available as if it were grown on light lands. I allude to his "Portable Farm Railway." I have now about a third of a mile of it employed on my farm, by which root crops have been carried off the most tenacious of my fields, and immense quantities of dung carried out upon my Hop-grounds, during the open weather, without occasioning the slightest injury to the land. It is simple in its construction, and easily managed by common farm labourers; and I find it most useful as a substitute for horses, in a multiplicity of ways. Like his clod-crushing roller, the portable railway is capable of almost universal application, on a large farm.

But to return from this incidental digression to the open furrow question. I will give another instance or two, from farms not in my occupation. The first is a small farm, of about 40 acres, which I drained last year. This land was unusually wet, and although it was thrown up in high narrow furrows, of about 8 feet wide, it was impassible for horses, excepting in the driest weather, when the ground baked up as hard as a brick. The seasons for sowing were frequently lost, as the land could not be got ready in time. Now the drains in this farm were put in at 4 and 4½ feet in depth, and at distances varying from 15 to 30 feet, such as from the character of the soil I deemed sufficient, the surface soil not being of one uniform texture. After the draining was completed I recommended the tenant to throw down all the high ridges, and lay the ground perfectly flat. He followed my

advice, and the land has ever since been thoroughly dry, without indicating the necessity of retaining any furrows. I walked over this farm during the wettest part of January; there was no water at all to be seen on the surface, and the ground under foot had become perfectly sound; though previous to the draining, after similar heavy rains, I have often seen, on the inclined surfaces of the fields, gullies washed out 2 and 3 feet deep, and the flats of the fields were so rotten that a person could not walk on them without sinking over his shoes at every step. The subsoil of this farm is also the gault clay.

I will only mention one more instance, taken from the land of a friend and neighbour of mine. The land he has drained rests upon the London clay. Previously it was a very poor wet pasture ground, producing little besides Rushes and Moss. He could not obtain a tenant for it at 2*s.* 6*d.* per acre. He therefore determined to drain it and occupy it himself. His drains are placed 4 feet deep, and 30 feet apart. The remedy has proved effectual, the land being as good now as the rest of his farm, and he could readily let it for 30*s.* per acre.

Here, again, we have an illustration of the non-necessity for open furrows derived from an experiment over some 50 or 60 acres, the whole of which now lies perfectly flat.

It is obviously impossible to lay down any uniform set of rules as to the proper distances at which drains should be placed so as to make them thoroughly efficient; these must be regulated in each case by the texture and consistency of the soil; but I do most unhesitatingly maintain, if the land be truly under-drained, that is, deeply enough and thickly enough, that open furrows to carry off surface water are more than useless. To the scientific farmer it would be mere waste time to descant upon the advantages accruing from water percolating through the soil instead of running over it; and more particularly since so much light has been thrown upon the *rationale* of the benefits arising from the percolation of water, by the invaluable discoveries resulting from the investigations of Professor Way and Mr. Thompson on the manuring-absorptive power of clay in our agricultural soils.

I ought, perhaps, to add that I invariably trench or subsoil immediately after draining. *J. M. Paine, March* 11.

P.S. On reading Mr. Mechi's paper on "Open Furrows," in the *Gazette* of to-day, I immediately determined this afternoon to walk to my farm and see the effects of a continuous heavy 12 hours' rain upon the land alluded to in my former letter. I considered this a capital opportunity for testing the accuracy of my statement relative to the absence of all *surface water*, upon my thickly and deeply drained land; for before the storm of to-day, during the past week, the rains have been so heavy as to saturate the soil with water, and our low grounds have been constantly flooded; so I thought if ever water was to be seen on the surface, I should find it there to-day. It was pouring with rain when I started from home, but there was a temporary clearing up of the weather about five minutes before I reached this part of my farm, in company with my bailiff. We walked over every part of the *stiffest* gault clay field that I possess, containing about 12 acres; and I can most confidently assert that there was no water whatever on the surface, and there was no symptom of the slightest rill having run upon the surface, during the heaviest period of the rain. In fact, every drop of water *percolated through the soil* into the deep drains below, from whence copious streams were issuing like little rivers. Moreover, it so happened that in this field there were 20 or 30 holes dug about it in different parts, each 2 feet deep, *and they were all free from water*, with the exception of 2 or 3, on a quarter of an acre, in one corner of the field, where the drains were placed 18 feet apart, instead of 12 feet, as in all other parts of the field—here there were about 2 inches of water at the bottom of the holes. This field is in Hops; the ground has not yet been dug, but the Hop hills are cut; thus leaving, at every 6 feet, little circular basins, 6 inches deep, most excellent receptacles, therefore, for the retention of surface water, if there had been any. Afterwards, indeed, on returning home, on lands not drained, I found these little basins filled to the brim with water. I am tempted to send you this statement of a simple fact, with a request that it may be added as a postscript to my letter sent to you some ten days ago. *J. M. Paine, March* 22.

## Home Correspondence.

*On Oats.*—As the time for sowing this grain has now recurred, it may not be unsuitable to pen a few plain remarks on the management of the crop, leaving it open for any corrections or additions that may suggest themselves to your editorial judgment. Oats, then, is a crop which with proper management may be grown on most lands, and after almost anything; although it may be considered an exhausting crop, as drawing much nourishment from the soil; and some farmers prefer buying their Oats, to raising them on their own land. And those who raise them, may often with advantage (especially in low-price times) keep them for home consumption, for the horses, as well as for the sheep, on large farms, to be mixed with their chaff, in their fold; and in lambing time, a few Oats and Cabbages support the ewes uncommonly well. Where land is too poor or stony for Barley, Oats may be, and often are, substituted, after fed off Turnips for instance, in which case Saintfoin (likewise a crop flourishing well on stony soils) may be sown down with them. After Beans may be another mode of culture, taking care to have the land well cleaned; but Oats often succeed best on a Clover or Saintfoin ley stale fallowed, and the seed harrowed broadcast in; under which method I have seen extraordinary crops grown, and the Oats came up thick a second time, so as to stand (with a mild season) mixed with Vetches, winter sown, for feed in May and June. In sowing this crop, more seed seems, by universal consent, to be used than any other grain; from 4 to 6 bushels. Four seems enough, and of course less in dibbling them, as is occasionally practised in Norfolk and Suffolk. Scotland claims the chief celebrity for its Oat raising, which are generally broadcast sown, the Scotch Potato-Oat being their best variety, which I have seen answer very well, grown on some thin stone brash land, in this county (on Mr. Dickenson's estate), the land having been brought into high cultivation by sheep folding and artificial manures; so that in these days of high-farming we may be safely placed on a par with our Northern neighbours, as to Oat growing; and from 10 to 12 qrs. per acre may be reckoned an average growth on a good soil, with good management. In some neighbourhoods it is the fashion to give horses Oats in the straw, but this is a wasteful practice, and it is always better to give it them bruised, with their chaff—the latter steamed, if the premises of the farmer allow of conveniences for it. The following is the rate of feeding per horse, I find on referring to a former report on Mr. Dickenson's farm.—"Each horse is allowed, per week, 1½ bushel of Oats, ½ bushel of split Beans (taken off through the summer, and Vetches or other green food allowed), ¼ cwt. of bran, moistened and mixed with as much steamed straw-chaff as they will eat; this treatment they thrive under. The chaff is cut by an engine of Corne's, worked by a pony, which cuts 1 bushel per minute, for horses, with the smaller wheel, and 2 bushels per minute for sheep and beasts, with the largest. Oats, ground into coarse meal, form much of the food of the Scotch poor. The meal is stirred in boiling water, to a thick consistency, which is then called porridge, and is eaten with milk or treacle. But it is in cakes that it is chiefly used; being made into dough, with water, and baked on an iron plate. In France and Germany they usually bake their Oats, as well as Rye, into loaves for horses' food, which they seem much to relish, and must be, one would imagine, a saving practice. Oats are often apt, when ripe, to shed, by which many are lost; which speaks strongly in favour of their being cut green, by which indeed they make the better sample. They are also often, as well as Barley, raked up loose at harvest, like hay, but why should not they have the same attention paid them as Wheat? and be tied up in neat sheaves. An old practice in the management, if it can be so called, of this crop was to alternately raise Oats and Grass—for example, in Wales, that is in North Wales, amongst the mountains, they will grow Oats, and then leave the land down three or four years for Grass, to take its chance. Occasionally where the altitude of the land allows, that is where it is not too highly situate, sowing as a variation, Wheat and Potatoes. *H. E., Clevedon, Somersetshire.*

*Education.*—Your correspondent "O. F." of last week says he is glad to find that landlords and agents are beginning to cultivate improvement, but that as yet there has not been time to cultivate those qualifications in tenants necessary to such improvement. I think it would be to the advantage of landholders to pay a little more attention to our endowed schools. How many are there which are almost useless? I know a richly-endowed school that is not provided with a single map, where the master's stipend is not equal to the wages of a journeyman tailor, and where the trustees, all of them landlords, will not allow the Government inspector to visit the school, neither will they take an active part in it themselves; and yet in that neighbourhood there is not a single school fit for a farmer to send his son to. If he wishes him to receive a decent education he must send him to a boarding-school at an expense of 15*l.* per year more than it ought to cost him, so that if he has two sons to send to school he must spend 30*l.* per year more for their instruction at a distance than it ought to be supplied to him for at home. Thus the boy not only loses the benefit of that physical training which he would receive at home to fit him for his future occupation, but the knowledge that is imparted to him is often of the most superficial kind: *e.g.*, the other day I met with a lad 14 years of age who had been under the care of a clergyman in Yorkshire upwards of two years, at an expense, all things included, of 40*l.* per year, yet he did not know a noun from a verb; he had never read any history, and as to geography he hardly knew what it meant; but he had taken his cyphering-book every half year to show his progress, in which there were a number of crotchety sums that he knew little about, and his father knew less, and so they were gulled. This may be an extreme case, but there are plenty of others that are little better. *S. J.*

*Taxation.*—The "Farmer's Magazine" for this month contains a report of a discussion at the London Farmers' Club on the subject of "How far taxation enters into the cost of agricultural produce." Notwithstanding the talent displayed, it is not to be wondered at that the conclusion to which the club came was not very definite; but it does seem strange that tenant farmers do not see that the taxation on the land, though occasionally perhaps causing them some inconvenience, as in the case of the malt tax, does not, in fact, fall upon them at all. Rent is diminished by the extent of the burdens, whatever they may be. If the burdens were lighter, the rent would be so much the more. Few landlords calculate how low they can afford to let land; but, on the contrary, how high a rent a good tenant can afford to pay—just as tenants do not take produce to market to sell at the lowest price they can afford to take, but at the highest price at which a purchaser can be found. The parties really affected by taxation on land are the landowner and the labourer; the former, because it keeps down his rents; the latter, because it discourages the culture of inferior soils, and so curtails the demand for his labour. If land is cultivated at all, the tenant, in these days of low profits in every department of trade, must be content to pay over as rent everything beyond a very moderate interest on his capital, and, if a working farmer, he must be satisfied with a very moderate remuneration to himself for superintendence. Protection or free trade will make no difference to him in this respect. It is also very strange to see so many persons introducing into the discussion a comparison between the present price of the public Funds turned into bushels of Wheat, and the price of the Funds in bushels of Wheat at a former distant period. The comparison may be a statistical curiosity, but it has no bearing on the question at issue. Mr. Mechi appears to be the only speaker who perceived this. In truth, beyond the daily influence which the varying value of money in the discount market exerts upon the price of the public Funds, their value mainly depends upon a sort of public opinion as to the solvency and stability of the finances of the country. In the midst of a war, in daily expectation of a foreign invasion, and with an expenditure far exceeding revenue, what was to be expected but a low price of the Funds as compared with every commodity? Now, all these things are changed, and the price of the Funds is changed as a natural consequence. The only way in which the price of corn influences the price of the Funds is, when a large importation, unbalanced by an equal exportation of other commodities in return, creates an unusual demand for bullion for export to restore the balance of trade. Then the Funds, like all other stocks and commodities, tend downwards. But taxation on the land, except so far as favours such a state of things by making the acreage of corn less, has no effect here; and if the acreage of corn were habitually greater, so would also be the number of habitual consumers of the corn of that increased acreage. It is, therefore, scarcely doubtful that the taxation on land has no influence at all in this matter. Unquestionably farmers are in a very difficult position at this moment. But the difficulty arises not from taxation, but from the impossibility of forming a sound opinion of the range of prices under free trade on which to base their calculations. Let not farmers deceive themselves. The landlord may have his rent increased, or the labourer his wages; but no system of taxation will long give the farmer more than the ordinary profit of trade, nor can any system long deprive him of it. *Alexander Hall Hall, Watergate, March* 20.

*Clover and Barley Seed-time.*—In a leading article of the agricultural part of the *Gardeners' Chronicle* of last Saturday, your readers are reminded of an experiment which Professor Henslow wishes to make for the determination of the cause of Clover failures. Some years ago, having had my attention directed to this subject, I thought, that as Clover was usually sown amongst a corn crop, grew as an under-growth for some months, in circumstances most unfavourable to the healthy development of the plant, and was left at harvest entirely exposed, it might, from the manner of its growth, be rendered incapable of enduring the cold of winter, or the trying vicissitudes of spring, and thus its frequent failure be accounted for. It appeared, however, from an experiment which I had speedily an opportunity of making, that this idea is not tenable. A friend of mine in this neighbourhood had a field of 20 acres, from which the red Clover had entirely disappeared in the winter. As it was necessary to plough the field for a crop of some kind or other, I urged him just to re-sow in the spring with Clover and Grass seeds for sheep pasture, in expectation that red Clover could not fail to grow and thrive when sown at such a season, and without a corn crop either to render the Clover plant weak, or to destroy it. The field was in excellent condition, and after being spring ploughed, was sown, as suggested, in the month of April. All the seeds brairded well, the red Clover was abundantly planted, and looked most promising towards the latter half of May, but by the end of June, or beginning of July, before sheep were turned into the field, there was not one plant of it to be found; it had entirely gone off, except on a small spot of reclaimed bog, which had been in tillage but a short time. It was not killed by frost, nor by drought, nor by any atmospheric cause, so far as any one here could judge, nor was it choked or destroyed by other Grasses. I beg to suggest to such of your readers as may be designing to make the wished for experiment, that should their Clovers braird and live for a little, and then die, like that about which I am writing, that it may be desirable to subject the dying or dead plants to the microscope; there may be something in the soil, some parasite which may prove fatal. You speak of making the experiment on the Barley land. In this country, Barley generally comes after Turnips; and in a rotation of four or five years this would leave a long period between the last failure and the present sowing. Why not try it on ground sown with Clover last spring, which has either not grown or died? If any should make the experiment in this way, the Clover, if it braird, will have to be constantly watched, that if it become diseased or die, it may be properly examined. *Tweedside, March* 27.

*Flax Seed.*—It is extraordinary to what lengths prejudice will carry men. In your report of M. Claussen's explanation of his experiments upon Flax a short time since, the Chevalier is stated to have intimated that Flax might be saved for seed in England; and we have had letters from Ireland begging for Riga barrel seed for sowing, and have heard lately of a man's giving 15*s.* per bushel for Riga seed! Why, Sir, for years we have sold only English grown seed for sowing, fearing to trust to foreign; and we have by us now Flax grown from English saved seed in the county of Clare, which beats by a foot Flax grown from Riga seed upon precisely the same land, and under the same circumstances, upon Mr. M. J. J. Donlan's plan. We believe the English grown seed to be far preferable to Riga seed, and trust that you will promote its growth in the United Kingdom, where so many thousands of acres of suitable land lie uncultivated, especially now that by recent discoveries its value is so much increased. *A Seed Merchant.*

*Skylark, a Merciful Plea for the.*—Mr. A. Shilmalier, who, in the last Number of the *Agricultural Gazette*, takes up the cudgels so unmercifully against my good friend, the skylark, for feasting on his young growing Wheat, is yet so courteous, whilst speaking of myself and of my writings, that I cannot but reply to his invocation of my aid with marked civility and attention, at least. To combat his views at any length in a newspaper, with a pen nimble as mine, would be an impracticable matter. My arguments, fairly urged, would occupy half your whole space. However, let your desponding correspondent join me some fine Sunday morning in my walk to church, either to Acton, Ealing, Kew, or Richmond. As we saunter along, with corn fields on our right and left, the "object" of our discourse shall be before us, behind us, on each side of us, and "above" us. His loud, happy, joyous "*Thrr-upp! thrrr-upp!*" shall greet us at every step; and as he rises, poised on air, leisurely to chant *his* hymn of praise to the Creator, in a voice of pure, clear melody, soaring aloft till "Heaven's gate" opens to give entrance to his anthem—THEN will we together plan the readiest means to bring about his destruction; THEN devise how best we can blow him and all his fraternity to pieces—with hollow iron tubes. 'Twere indeed a project worthy of us both; for we are both men, and born, no doubt, with common feelings of humanity. I grant your correspondent has some cause for complaint *; so have all *we* busy mercantile mortals pent up in London, when those gigantic, Mammoth organs "play up" before our doors, in office hours. The hideous, unearthly noises emitted from these "infernal machines," do fearful damage to the human frame; they are indeed *more* than a fair "set off" to the ravages inflicted by the larks. Yet have WE no redress, save to LAUGH "in spite of our teeth." Let Mr. S. do the same, and his sorrows over the "trials of life" will sit lighter. I could with ease propose an efficient remedy for the destruction of the larks, but it would be inconsistent with my duty—irreconcileable with my avowed principles. Let your worthy correspondent wait patiently until Christmas. He will then have full revenge. Two-thirds, perhaps, of the skylarks which now torment him, and, unbidden, share his bounty, will be found slaughtered; lying "cheek by jowl" in the poulterers' window, and awaiting the still further indignity of a wooden skewer, which will most assuredly be run through each one of their individual gizzards. In declining to assist Mr. Shilmalier, I do so—not rudely, but deprecatingly. I seek to make a "convert" of him. What *will* he say, when I come to treat of the *Skylark*, and write his "Natural History" in my weekly "Treatise on British Song Birds?" *W. Kidd, New Road, Hammersmith, April* 3.

* Although I am perfectly aware that his constant *locus in quo* is the corn-fields; yet, this is the very first time I ever heard of a similar complaint touching the *ravages* of the skylark among growing corn. I have always understood that, at this season, his food consisted almost wholly of the wireworm, earth-grub, and the larvæ of insects. May there not be—I ask it with all due submission—some little mistake in the matter? Let us hope so. It is difficult to imagine that the larks in Ireland, and those in England, should differ so *widely* in their habits.

## Societies.

### ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A MONTHLY COUNCIL was held at the Society's House, Hanover-square, on Wednesday last, the 2d of April; present, his Grace the Duke of RICHMOND, K.G., President, in the chair; Marquis of Downshire, Lord Camoys, Lord Berners, Lord Southampton, Lord Braybrooke, Lord Bridport, Lord Ashburton, Hon. R. H. Clive, M.P., Sir Thomas Dyke Acland, Bart. M.P., Sir Robert Price, Bart., M.P., Sir John V. B. Johnstone, Bart., M.P., Sir Montague Cholmeley, Bart., M.P., Col. Austin, Mr. Raymond Barker, Mr. C. Barnett, Mr. Beasley, Mr. S. Bennett, Mr. Bramston, M.P., Mr. Brandreth, Mr. Burke, Mr. W. G. Cavendish, M.P., Col. Challoner, Mr. Evelyn Denison, M.P., Mr. S. Druce, Mr. Foley, M.P., Mr. Garrett, Mr. Brandreth Gibbs, Mr. Grantham, Mr. Hamond, Mr. Fisher Hobbs, Mr. Hudson (Castleacre), Mr. Jonas, Mr. Kinder, Mr. Lawes, Mr. Milward, Mr. Pusey, M.P., Mr. Sandford, Prof. Sewell, Mr. Shaw (London), Mr. Shaw (Northampton), Mr. Shelley, Mr. Sillifant, Prof. Simonds, Mr. Simpson, Mr. Slaney, M.P., Mr. Stansfield, M.P., Mr. Thompson, Mr. Turner (Barton), Mr. C. Hampden Turner, Prof. Way, Mr. Jonas Webb, and Mr. Wilson.

The following new members were elected:

Cumming, Lachlan, Munfield, by Inverness.
Turner, C. J., Staplegrove, Taunton, Somerset.
Musgrave, Christopher, Claverdon, Warwick.
Lobb, George, Lawhitton, Launceston, Cornwall.
Hatchard, Rev. John Alton, Lee Priory, Wingham, Kent.
Smythe, Frederick, Tenby, Pembrokeshire.
Hayward, Henry Scott, Folkington, Willingdon, Sussex.
Honywood, William, Chilton Lodge, Hungerford, Berks.
Brett, J., Corfe Lodge, Wimborne, Dorset.

The names of 11 candidates for election at the next meeting were then read.

FINANCES.—Mr. RAYMOND BARKER, Chairman of the Finance Committee, laid before the Council the Report of the Accounts of the Society, to the end of the previous month; from which it appeared that the current cash balance in the hands of the bankers was 2038*l.* (including 319*l.* on account of life-compositions).

CHEMICAL INVESTIGATIONS.—Mr. PUSEY, M.P., Chairman of the Chemical Committee, laid before the Council the following report, which was received and adopted.

REPORT.

Your Committee have to report, that since April 1850, about 120 analyses have been executed, at the request of members, at the Laboratory. Though this number is not unsatisfactory, they observe with regret that, of these, only 20 have been analyses of guano. In the hope that members may avail themselves more largely of this only security against the heavy loss arising from adulteration, the Committee recommend, that Mr. Way's spontaneous offer of reducing the charge for a partial analysis of guano from 7*s.* 6*d.* to 5*s.*, and for a complete analysis from 20*s.* to 10*s.*, be accepted; and they recommend to members of the Society, the adoption of this easy defence against fraud.—Of the subjects adopted for inquiry last year, "The absorptive properties of soils" has been carried on, and the results have appeared in a lecture delivered by Mr. Way, and in the Journal. The Committee recommend that this novel and interesting subject be pursued further, with reference especially to time and to the mode in which ammonia is set free again in soils, for the support of vegetation; on which branch of the inquiry Mr. Way is prepared to deliver a lecture before the Society.—The analysis of marls has been completed, and the Committee recommend as a new subject, "The Torrefaction of Soils," that is to say, the causes of the manuring properties of burnt clay in certain districts; and they hope that members residing in such districts will send immediately to the secretary specimens of such fertilising clays, in the raw and in the burnt state. It would be also very desirable that specimens of clays which have been found to fail as manure, after burning, should be forwarded.—The examination of the nutritive properties of Grasses has been carried on to a considerable extent, and it appears to the Committee desirable that it should be continued in the ensuing year, with a view to a complete examination of the subject.

April 1, 1851. (Signed) PHILIP PUSEY, Chairman.

COUNTRY MEETING OF 1851.—The Council were favoured by the attendance of Deputations from Kingston-on-Thames and Windsor, who kindly explained to the Council the advantages respectively possessed by Bushy Park and the Windsor Home Park, as sites for the Society's Country Meeting to be held in July next. The noble President having thanked these Deputations for their personal attendance, the information they had communicated, and the various plans and other documents they had laid before them; they retired from the Council Room, when the Marquis of Downshire brought forward, and Sir Robert Price, Bart., M.P., seconded, the motion of which his lordship had given notice, that the Home Park at Windsor should be the place of the Country Meeting, instead of Bushy Park, as previously intended. The whole subject received from the Council the maturest consideration, and it was finally carried, on the motion of Sir Thomas Acland, Bart., M.P., seconded by the Hon. R. H. Clive, M.P., and after full discussion of the various points and bearings of the question, that the same Inspection Committee that visited Bushy Park, should be requested to visit the proposed sites and localities at Windsor, offered to the Society by the gracious permission of Her Majesty and Prince Albert; and that the President should be desired to direct a special Council to be summoned for the purpose of receiving their report and rescinding the resolution of the Council, by which Bushy Park was decided upon as the locality of meeting, with a view to the substitution of the Home Park of Windsor in its place. The President at once acceded to this request, and directed such a special Council to be summoned for Wednesday, the 16th instant.

COUNTRY MEETING OF 1852.—Memorials, and the requisite plans of sites connected with the Country Meeting of the Society, were laid before the Council from the authorities of Lewes and Maidstone, in reference to the Country Meeting of 1852, to be held in the South-Eastern District, comprising the counties of Kent, Surrey, and Sussex. Mr. Raymond Barker, Mr. Brandreth, Mr. Brandreth Gibbs, Mr. Fisher Hobbs, Mr. Jonas, Mr. Milward, and Mr. Shaw, were appointed an Inspection Committee to visit these localities, and to report their respective accommodation and advantages to the Council on the 7th of May, when the decision of the place of meeting would be made.

STEWARD OF CATTLE YARD.—On the motion of Mr. BRANDRETH, Mr. Milward was appointed a Steward of the Cattle Yard at the Country Meetings of the Society, in the place of Mr. Hudson, of Castleacre, who retires this year by rotation.

Communications were received from a public meeting which was held at Slough, the Royal Bucks Agricultural Society, and the Great Western, the South-Western, and the South-Eastern Railway Companies, as well as from various parties making inquiries on points connected with the ensuing Country Meeting of the Society.

The Council then adjourned to the 9th of April.
